| GetLastError () | String  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| Update ()       | Boolean | Update the current Parameter object after modifying or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.                |

### 18.2.2.6.10 ParamTag Class

A *ParamTag* is a Tagged Value associated with a method parameter.

#### ParamTag Attributes

| Attribute    | Type                                                | Notes                                                                     |
|--------------|-----------------------------------------------------|---------------------------------------------------------------------------|
| ElementGUID  | String                                              | Read/Write. GUID of the parameter with which this ParamTag is associated. |
| FQName       | String                                              | Read only. The fully qualified name of the tag.                           |
| ObjectType   | <a href="#">ObjectType</a><br><small>[1835]</small> | Read only. Distinguishes objects referenced through a Dispatch interface. |
| PropertyGUID | String                                              | Read/Write. A system generated GUID to identify the Tagged Value.         |
| Tag          | String                                              | Read/Write. The actual tag name.                                          |
| Value        | String                                              | Read/Write. The value associated with this tag.                           |

#### ParamTag Methods

| Method          | Type    | Notes                                                                                                                                                                         |
|-----------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GetLastError () | String  | Returns a string value describing the most recent error that occurred in relation to this object.                                                                             |
| Update ()       | Boolean | Updates the current <i>ParamTag</i> object after modifying or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information. |

### 18.2.2.6.11 Partitions Collection

A collection of internal element partitions (regions). This is commonly seen in **Activity, State, Boundary, Diagram Frame** and similar elements. Not all elements support partitions.

This collection contains a set of *Partition* elements. The set is read/write: information is not saved until the host element is saved, so ensure that you call the *Element.Save* method after making changes to a Partition.

#### Partition Attributes

| Attribute  | Type                                                | Notes                                                                                  |
|------------|-----------------------------------------------------|----------------------------------------------------------------------------------------|
| Name       | String                                              | Read/Write. The partition name; can represent a condition or constraint in some cases. |
| Note       | String                                              | Read/Write. A free text note associated with this partition.                           |
| ObjectType | <a href="#">ObjectType</a><br><small>[1835]</small> | Read only. Distinguishes objects referenced through a Dispatch interface.              |
| Operator   | String                                              | Read/Write. An optional operator value that specifies the partition type.              |

| Attribute   | Type          | Notes                                                            |
|-------------|---------------|------------------------------------------------------------------|
| <b>Size</b> | <i>String</i> | Read/Write. Vertical or horizontal width of partition in pixels. |

**18.2.2.6.12 Properties Class****Properties**

Properties Attributes

| Attribute         | Type                                         | Notes                                                                     |
|-------------------|----------------------------------------------|---------------------------------------------------------------------------|
| <b>Count</b>      | <i>Long</i>                                  | The number of properties that are available for this object.              |
| <b>ObjectType</b> | <a href="#">ObjectType</a> <sup>[1835]</sup> | Read only. Distinguishes objects referenced through a Dispatch interface. |

Properties Methods

| Method                     | Type            | Notes                                                                                                                                                                                                                                                                                                         |
|----------------------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Item (object Index)</b> | <i>Property</i> | Returns a property either by name or by zero-based integer offset into the list of properties.<br><br>Parameter: <ul style="list-style-type: none"> <li>• Index: Variant - either a string representing the property name or an integer representing the zero-based offset into the property list.</li> </ul> |

**Property**

Property Attributes

| Attribute         | Type                                         | Notes                                                                                                                                                                                                                                                       |
|-------------------|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>       | <i>String</i>                                | Read only. Identifies the property. The object to which the properties list applies can have an automation property with the same name, in which case the data accessed through <b>Value</b> is identical to that obtained through the automation property. |
| <b>ObjectType</b> | <a href="#">ObjectType</a> <sup>[1835]</sup> | Read only. Distinguishes objects referenced through a Dispatch interface.                                                                                                                                                                                   |
| <b>Type</b>       | <a href="#">PropType</a> <sup>[1836]</sup>   | Read only. Provides an indication of what sort of data is going to be stored by this property. This restriction can be further defined by the Validation attribute.                                                                                         |

| Attribute  | Type    | Notes                                                                                                                                                                                                                                                                            |
|------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Validation | String  | Read only. Optional string that is used to validate any data that is passed to the Value attribute. This string is used by the programmer at run time to provide an indication of what's expected, and by Enterprise Architect to ensure that the submitted data is appropriate. |
| Value      | Variant | Read/write. The value of the property as defined in the other fields.                                                                                                                                                                                                            |

#### 18.2.2.6.13 Transitions Collection

Applies only to *Timeline elements*. A Timeline element displays 0 or more state transitions at set times on its extent. This collection enables you to access the transition set. You can also access additional information by referring to the connectors associated with the Timeline, and by referencing messages passed between timelines. Note that any changes made to elements in this collection are only saved when the main element is saved.

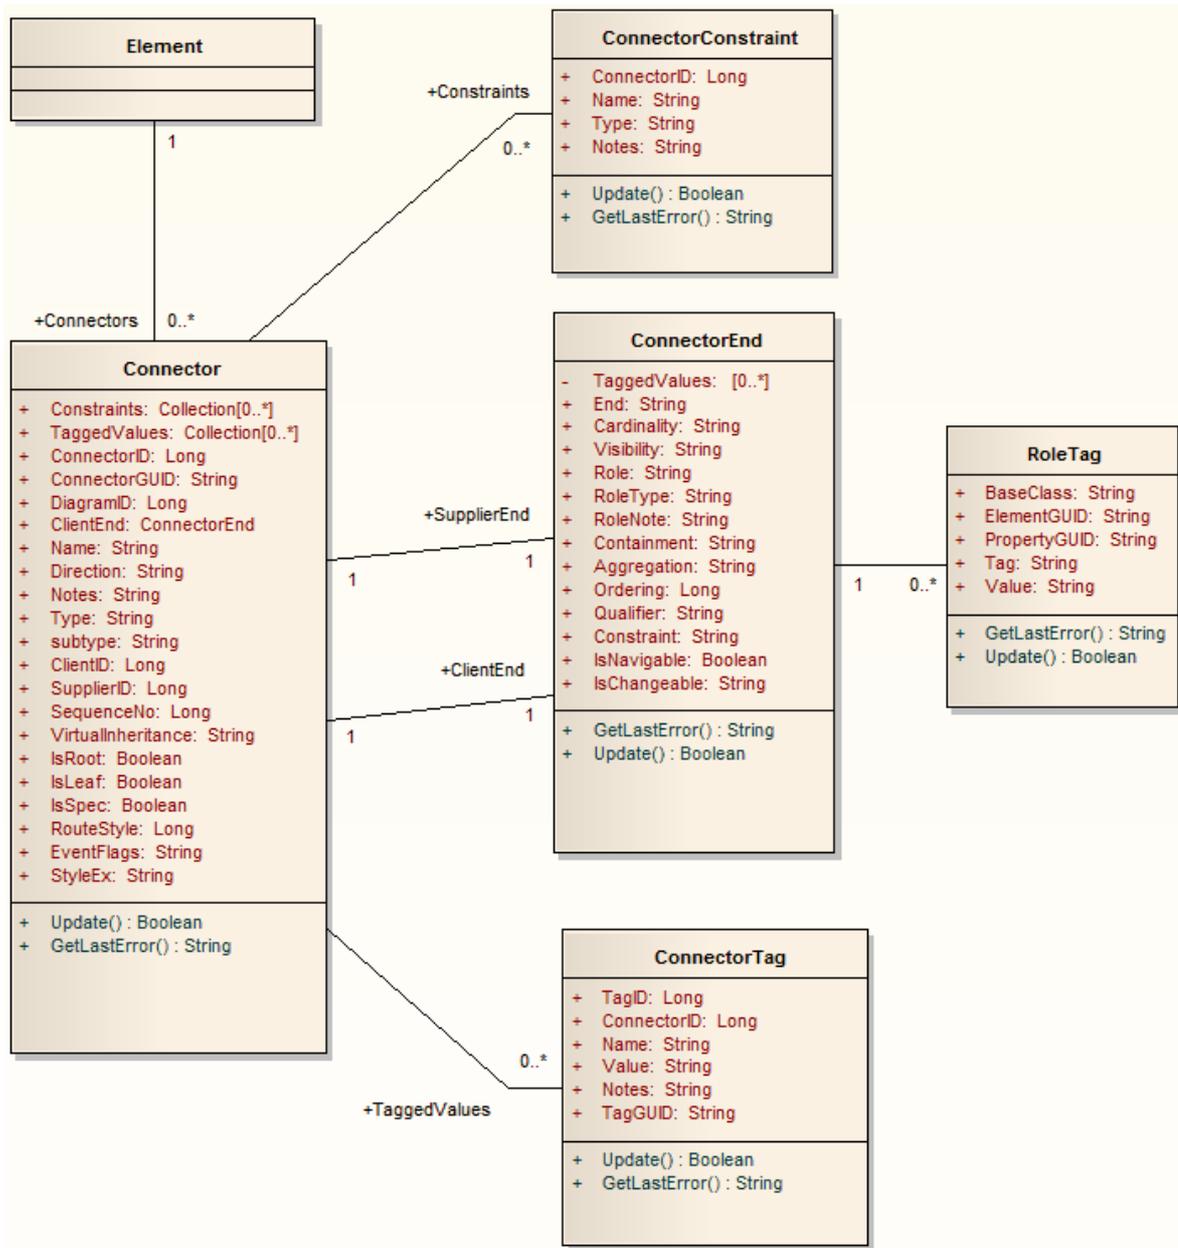

##### Transition Attributes

| Attribute          | Type                                 | Notes                                                                                     |
|--------------------|--------------------------------------|-------------------------------------------------------------------------------------------|
| DurationConstraint | String                               | Read/Write. A constraint on the time duration that the transition takes.                  |
| Event              | String                               | Read/Write. Event (optional) that initiated transition.                                   |
| Note               | String                               | Read/Write. A free text note.                                                             |
| ObjectType         | <a href="#">ObjectType</a><br>[1835] | Read only. Distinguishes objects referenced through a Dispatch interface.                 |
| TimeConstraint     | String                               | Read/Write. A constraint on when the transition has to be complete by.                    |
| TxState            | String                               | Read/Write. The state to transition to. Defined in the <b>Timeline Properties</b> dialog. |
| TxTime             | String                               | Read/Write. The time that the transition occurs. Value depends on range set in diagram.   |

#### 18.2.2.7 Connector Package

The *Connector* package details how connectors between elements are accessed and managed.

##### Example:

### 18.2.2.7.1 Connector Class

### Connector Methods

| Method                 | Type           | Notes                                                                                                                                                                                |
|------------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object<br><br>This function is rarely used, as an exception is thrown when an error occurs |
| <b>Update ()</b>       | <i>Boolean</i> | Update the current <i>ConnectorObject</i> after modification or appending a new item<br><br>If <b>false</b> is returned, check the <i>GetLastError</i> function for more information |

#### 18.2.2.7.2 ConnectorConstraint Class

A *ConnectorConstraint* holds information about special conditions that apply to a connector. It is accessed through the Connector *Constraints* collection.

Associated table in .EAP file: *t\_connectorconstraints*

ConnectorConstraint Attributes

| Attribute   | Type                                 | Notes                                                                     |
|-------------|--------------------------------------|---------------------------------------------------------------------------|
| ConnectorID | Long                                 | Read/Write. A local ID value (long) - system generated.                   |
| Name        | String                               | Read/Write. The constraint name.                                          |
| Notes       | String                               | Read/Write. Notes about this constraint.                                  |
| ObjectType  | <a href="#">ObjectType</a><br>[1835] | Read only. Distinguishes objects referenced through a Dispatch interface. |
| Type        | String                               | Read/Write. The constraint type.                                          |

ConnectorConstraint Methods

| Method          | Type    | Notes                                                                                                                                                                                      |
|-----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GetLastError () | String  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs.      |
| Update ()       | Boolean | Update the current <i>ConnectorConstraint</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information. |

**18.2.2.7.3 ConnectorEnd Class**

A *ConnectorEnd* contains information about a single end of a connector. A *ConnectorEnd* is accessed from the connector as either the *ClientEnd* or *SupplierEnd*.

Associated table in .EAP file: derived from *t\_connector*

ConnectorEnd Attributes

| Attribute           | Type    | Notes                                                                                                                | See Also |
|---------------------|---------|----------------------------------------------------------------------------------------------------------------------|----------|
| Aggregation         | Long    | Read/Write. Aggregation as it applies to this end. Valid values are:<br><br>0 = None<br>1 = Shared<br>2 = Composite. |          |
| Alias               | String  | Read/Write. An optional alias for this connector end.                                                                |          |
| AllowDuplicat<br>es | Boolean | Read/Write. For multiplicities greater than 1, indicates that duplicate entries are possible.                        |          |
| Cardinality         | String  | Read/Write. Cardinality associated with this end.                                                                    |          |
| Constraint          | String  | Read/Write. A constraint that can be applied to this connector end.                                                  |          |
| Containment         | String  | Read/Write. Containment type applied to this connector                                                               |          |

| Attribute                | Type                                                | Notes                                                                                                                                                                                         | See Also                                               |
|--------------------------|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
|                          |                                                     | end.                                                                                                                                                                                          |                                                        |
| <b>Derived</b>           | <i>Boolean</i>                                      | Read/Write. Indicates that the value of this end is derived.                                                                                                                                  |                                                        |
| <b>DerivedUnion</b>      | <i>Boolean</i>                                      | Read/Write. Indicates the value of this role derived from the union of all roles that subset this.                                                                                            |                                                        |
| <b>End</b>               | <i>String</i>                                       | Read only. The end this <i>ConnectorEnd</i> object applies to: <i>Client</i> or <i>Supplier</i> .                                                                                             |                                                        |
| <b>IsChangeable</b>      | <i>String</i>                                       | Read/Write. Flag indicating whether this end is changeable or not.<br>Values: <b>frozen</b> , <b>addOnly</b> or <b>none</b> .                                                                 |                                                        |
| <b>IsNavigable</b>       | <i>Boolean</i>                                      | Read/Write. Flag indicating this end is navigable from the other end.                                                                                                                         |                                                        |
| <b>Navigable</b>         | <i>String</i>                                       | Read/Write. Indicates whether this role of an association is navigable from the opposite classifier. Three values are valid: <i>Navigable</i> , <i>Non-Navigable</i> and <i>Unspecified</i> . |                                                        |
| <b>ObjectType</b>        | <a href="#">ObjectType</a><br><small>[1835]</small> | Read only. Distinguishes objects referenced through a Dispatch interface.                                                                                                                     |                                                        |
| <b>Ordering</b>          | <i>Long</i>                                         | Read/Write. Ordering for this connector end.                                                                                                                                                  |                                                        |
| <b>OwnedByClassifier</b> | <i>Boolean</i>                                      | Read/Write. Indicates this Association end corresponds to an attribute on the opposite end of the Association.                                                                                |                                                        |
| <b>Qualifier</b>         | <i>String</i>                                       | Read/Write. A qualifier that can apply to connector end.                                                                                                                                      |                                                        |
| <b>Role</b>              | <i>String</i>                                       | Read/Write. The connector end role.                                                                                                                                                           |                                                        |
| <b>RoleNote</b>          | <i>String</i>                                       | Read/Write. Notes associated with the role of this connector end.                                                                                                                             |                                                        |
| <b>RoleType</b>          | <i>String</i>                                       | Read/Write. The role type applied to this end of the connector.                                                                                                                               |                                                        |
| <b>Stereotype</b>        | <i>String</i>                                       | Read/Write. Sets or gets the stereotype for this connector end.                                                                                                                               |                                                        |
| <b>StereotypeEx</b>      | <i>String</i>                                       | Read/Write. All the applied stereotypes of the connector end in a comma-separated list.                                                                                                       |                                                        |
| <b>TaggedValues</b>      | <i>Private</i>                                      | Read only. Collection of <b>RoleTag</b> objects.                                                                                                                                              | <a href="#">RoleTag Class</a><br><small>[1919]</small> |
| <b>Visibility</b>        | <i>String</i>                                       | Read/Write. Scope associated with this connector end. Valid types are: <i>Public</i> , <i>Private</i> , <i>Protected</i> and <i>Package</i> .                                                 |                                                        |

#### ConnectorEnd Methods

| Method                 | Type          | Notes                                                                                                                                                                         |
|------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i> | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error |

| Method           | Type           | Notes                                                                                                                                                                               |
|------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  |                | occurs.                                                                                                                                                                             |
| <b>Update ()</b> | <i>Boolean</i> | Update the current <i>ConnectorEnd</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information. |

#### 18.2.2.7.4 ConnectorTag Class

A *ConnectorTag* is a Tagged Value for a connector and is accessed through the Connector *TaggedValues* collection.

Associated table in .EAP file: *t\_connectortag*

#### ConnectorTag Attributes

| Attribute          | Type                                 | Notes                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ConnectorID</b> | <i>Long</i>                          | Read/Write. The local ID of the associated connector.                                                                                                                                                                                                                                                                                                                                                                        |
| <b>FQName</b>      | <i>String</i>                        | Read only. The fully qualified name of the tag.                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Name</b>        | <i>String</i>                        | Read/Write. The tag or name.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Notes</b>       | <i>String</i>                        | Read/Write. Further descriptive notes about this tag.<br>If <b>Value</b> (below) is set to " <b>&lt;memo&gt;</b> ", then <b>Notes</b> should contain the actual Tagged Value content.                                                                                                                                                                                                                                        |
| <b>ObjectType</b>  | <a href="#">ObjectType</a><br>[1835] | Read only. Distinguishes objects referenced through a Dispatch interface.                                                                                                                                                                                                                                                                                                                                                    |
| <b>TagGUID</b>     | <i>String</i>                        | Read/Write. A globally unique ID for this Tagged Value.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>TagID</b>       | <i>Long</i>                          | Read only. A local ID to identify the Tagged Value.                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Value</b>       | <i>String</i>                        | Read/Write. The value assigned to this tag.<br>This field has a 255 character limit. If the value is greater than 255 characters long, set the value to " <b>&lt;memo&gt;</b> " and insert the body of text in the <b>Notes</b> attribute (above).<br>When reading existing Tagged Values, if <b>Value</b> = " <b>&lt;memo&gt;</b> " then the developer should read the actual body of text from the <b>Notes</b> attribute. |

#### ConnectorTag Methods

| Method                 | Type           | Notes                                                                                                                                                                             |
|------------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object.<br>This function is rarely used as an exception is thrown when an error occurs. |
| <b>Update ()</b>       | <i>Boolean</i> | Update the current <i>ConnectorTag</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i>                              |

| Method | Type | Notes                          |
|--------|------|--------------------------------|
|        |      | function for more information. |

### 18.2.2.7.5 RoleTag Class

#### Reference:

| Topic                | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | See also |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| <b>General Usage</b> | <p>This interface provides access to the association Role Tagged Values. Each connector end has a RoleTag collection that can be accessed to add, delete and access the RoleTags.</p> <p>In code you create something that resembles the following (where con is a Connector Object):</p> <p>Code fragment for accessing a RoleTag in VB.NET:</p> <pre> client = con.ClientEnd client.Role = "m_client" client.Update() tag = client.TaggedValues.AddNew ("tag", "value") tag.Update() tag = client.TaggedValues.AddNew ("tag2", "value2") tag.Update() client.TaggedValues.Refresh() For idx = 0 To client.TaggedValues. Count - 1     tag = client.TaggedValues.Get At (idx)     Console.WriteLine(tag.Tag) client.TaggedValues.DeleteAt (idx, False) Next tag = Nothing </pre> |          |

#### RoleTag Attributes

| Attribute           | Type                                                | Notes                                                                                               |
|---------------------|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| <b>BaseClass</b>    | <i>String</i>                                       | Read/Write. Indicates the role end; set to <b>ASSOCIATION_SOURCE</b> or <b>ASSOCIATION_TARGET</b> . |
| <b>ElementGUID</b>  | <i>String</i>                                       | Read/Write. GUID of the connector with which this role tag is associated.                           |
| <b>FQName</b>       | <i>String</i>                                       | Read only. The fully qualified name of the tag.                                                     |
| <b>ObjectType</b>   | <a href="#">ObjectType</a><br><small>[1835]</small> | Read only. Distinguishes objects referenced through a Dispatch interface.                           |
| <b>PropertyGUID</b> | <i>String</i>                                       | Read/Write. A system generated GUID to identify the Tagged Value.                                   |
| <b>Tag</b>          | <i>String</i>                                       | Read/Write. The actual tag name.                                                                    |
| <b>Value</b>        | <i>String</i>                                       | Read/Write. The value associated with this tag.                                                     |

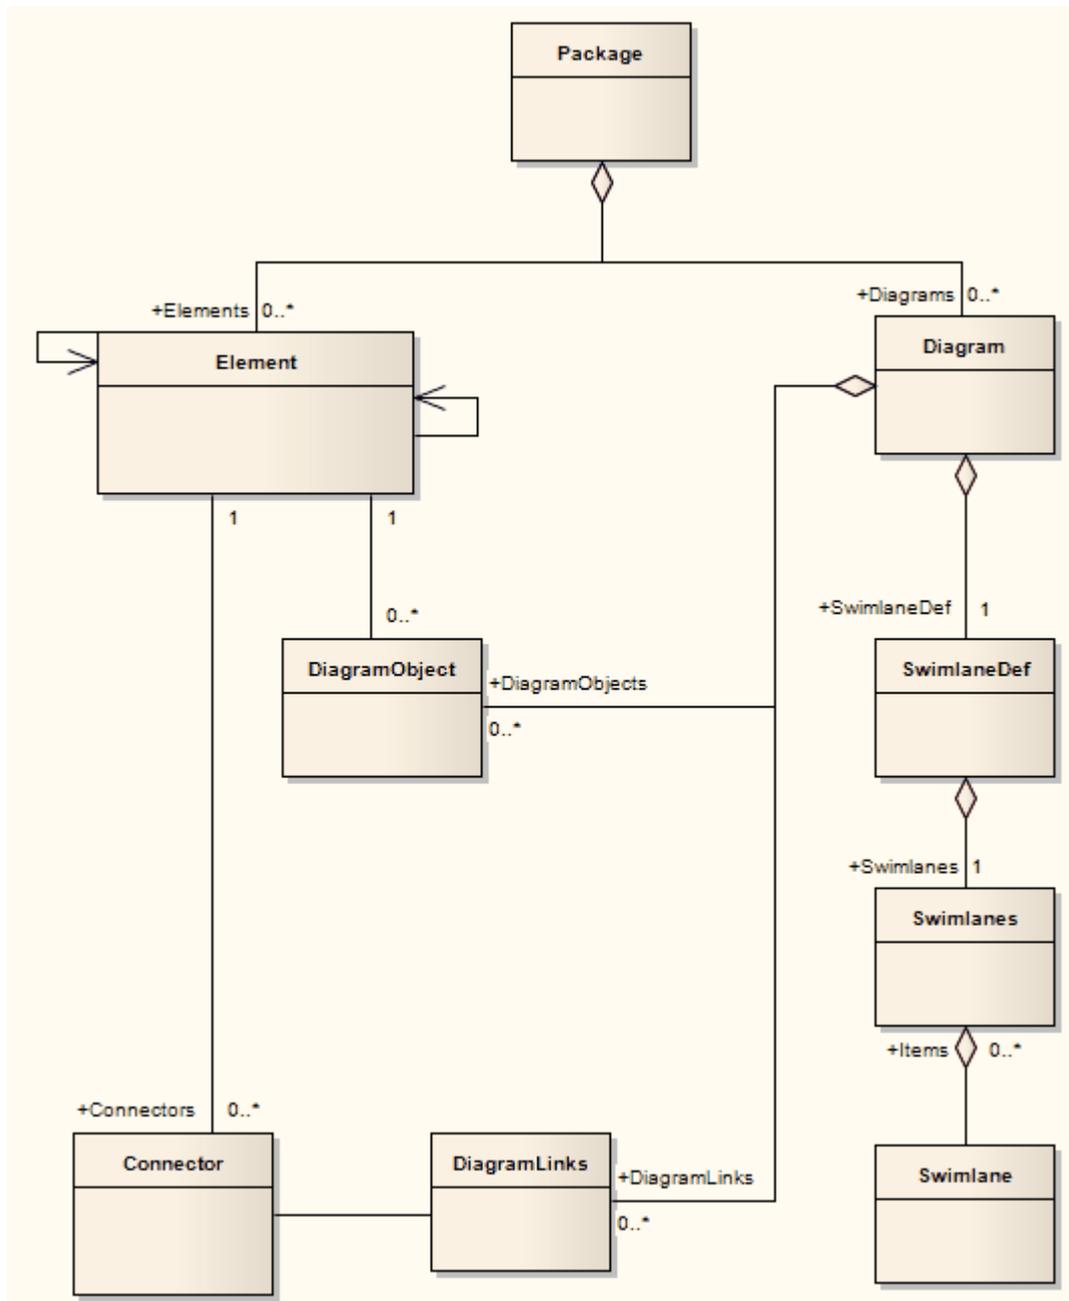

**RoleTag Methods**

| Method                 | Type           | Notes                                                                                                                                                                                 |
|------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| <b>Update ()</b>       | <i>Boolean</i> | Update the RoleTag after changes or on initial creation. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.                                    |

**18.2.2.8 Diagram Package**

The *Diagram* package has information on a diagram and on *DiagramObject* and *DiagramLink*, which are the instances of elements within a diagram.

**Example:**

### 18.2.2.8.1 Diagram Class

| <b>General Usage</b> | A <i>Diagram</i> corresponds to a single Enterprise Architect diagram. It is accessed through the Package Diagrams collection and in turn contains a collection of diagram objects and diagram connectors. Adding to the <i>Diagram Object</i> Class adds an element to the diagram (the element must already exist). When adding a new diagram, you must set the diagram type to a valid type; these are: |          |

| Topic | Detail                                                                                                                                                                                                                                                                                                                                          | See also |

Flag to indicate elements from other packages should be highlighted.                                                                                                                                                                                                                                                                              |                                                              |
| <b>IsLocked</b>         | <i>Boolean</i>                                                  | Read/Write. Flag indicating whether this diagram is locked or not.                                                                                                                                                                                                                                                                                            |                                                              |
| <b>MetaType</b>         | <i>String</i>                                                   | Read only. The diagram's domain-specific meta type, as defined by an MDG Technology.                                                                                                                                                                                                                                                                          |                                                              |
| <b>ModifiedDate</b>     | <i>Variant</i>                                                  | Read/Write. The date the diagram was last modified.                                                                                                                                                                                                                                                                                                           |                                                              |

| Attribute           | Type                                               | Notes                                                                                                                                                                                                                                     | See Also                                                |
|---------------------|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| Name                | String                                             | Read/Write. The diagram name.                                                                                                                                                                                                             |                                                         |
| Notes               | String                                             | Read/Write. Set/retrieve notes for this diagram.                                                                                                                                                                                          |                                                         |
| ObjectType          | <a href="#">ObjectTy<br/>pe</a> <sup>[1835]</sup>  | Read only. Distinguishes objects referenced through a Dispatch interface.                                                                                                                                                                 |                                                         |
| Orientation         | String                                             | Read/Write. Page orientation: <b>P</b> for Portrait or <b>L</b> for Landscape.                                                                                                                                                            |                                                         |
| PackageID           | Long                                               | Read/Write. An ID of the package that this diagram belongs to.                                                                                                                                                                            |                                                         |
| ParentID            | Long                                               | Read/Write. An optional ID of an element that 'owns' this diagram; for example, a Sequence diagram owned by a Use Case.                                                                                                                   |                                                         |
| Scale               | Long                                               | Read/Write. The zoom scale (default is 100).                                                                                                                                                                                              |                                                         |
| SelectedConnector   | <a href="#">Connect<br/>or</a> <sup>[1911]</sup>   | Read/Write. The currently selected connector on this diagram. Null if there is no currently selected diagram.                                                                                                                             |                                                         |
| SelectedObjects     | <a href="#">Collectio<br/>n</a> <sup>[1841]</sup>  | Read only. Gets a collection representing the currently selected elements on the diagram. Can remove objects from this collection to deselect them, and add elements to the collection by passing the Object ID as a name to select them. |                                                         |
| ShowDetails         | Long                                               | Read/Write. Flag to indicate Diagram Details text should be shown. <b>1</b> = Show, <b>0</b> = Hide.                                                                                                                                      |                                                         |
| ShowPackageContents | Boolean                                            | Read/Write. Flag to indicate package contents should be shown in the current diagram.                                                                                                                                                     |                                                         |
| ShowPrivate         | Boolean                                            | Read/Write. Flag to show or hide Private features.                                                                                                                                                                                        |                                                         |
| ShowProtected       | Boolean                                            | Read/Write. Flag to show or hide Protected features.                                                                                                                                                                                      |                                                         |
| ShowPublic          | Boolean                                            | Read/Write. Flag to show or hide Public features.                                                                                                                                                                                         |                                                         |
| Stereotype          | String                                             | Read/Write. Sets or gets the stereotype for this diagram.                                                                                                                                                                                 |                                                         |
| StyleEx             | String                                             | Read/Write. Advanced style settings. Reserved for the use of Sparx Systems.                                                                                                                                                               |                                                         |
| Swimlanes           | String                                             | Read/Write. Information on swimlanes contained in the diagram. Please note that this property is superseded by <b>SwimlaneDef</b> .                                                                                                       | <a href="#">SwimlaneDef<br/>Class</a> <sup>[1927]</sup> |
| SwimlaneDef         | <a href="#">Swimlan<br/>eDef</a> <sup>[1927]</sup> | Read/Write. Information on swimlanes contained in the diagram.                                                                                                                                                                            |                                                         |
| Type                | String                                             | Read only. The diagram type. See the <i>t_diagramtypes</i> table in the .EAP file for more information.                                                                                                                                   |                                                         |
| Version             | String                                             | Read/Write. The version of the diagram.                                                                                                                                                                                                   |                                                         |

| <b>GetLastError ()</b>                                    | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs.                                                                                                                                                                                                                                                                                                                                                                                                                           |                                     |
| <b>ReleaseUserLock ()</b>                                 | <i>Boolean</i> | Releases a group lock or user lock on this diagram object.<br><br>Throws an exception if the operation fails. Use <i>GetLastError()</i> to retrieve error information.                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                     |
| <b>ReorderMessages ()</b>                                 | <i>Void</i>    | Resets the display order of Sequence and Collaboration messages. Typically used after inserting or deleting messages in the diagram.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                     |
| <b>ShowAsElement List (bool ShowAsList, bool Persist)</b> | <i>Boolean</i> | Toggles the diagram display between diagram format and <b>Diagram List</b> depending on the value of <i>ShowAsList</i> .<br><br>If <i>Persist</i> is set, the display format is written to the database so the diagram always opens in that format (diagram or list). Otherwise, the display format falls back to the default (diagram) once the display is closed.<br><br>Parameters: <ul style="list-style-type: none"> <li>ShowAsList: Boolean - indicates diagram or <b>Diagram List</b></li> <li>Persist: Boolean - indicates set (maintain <i>ShowAsList</i> value) or not (revert to default)</li> </ul> | <a href="#">Diagram List</a><br>462 |
| <b>Update ()</b>                                          | <i>Boolean</i> | Updates this diagram object after modification or appending a new item.<br><br>If <b>false</b> is returned, use <i>GetLastError()</i> to retrieve error information.                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                     |

### 18.2.2.8.2 DiagramLinks Class

A *DiagramLink* is an object that holds display information about a connector between two elements in a specific diagram. It includes, for example, the custom points and display appearance. It can be accessed from the Diagram **DiagramLinks** collection.

Associated table in .EAP file: *t\_diagramlinks*

#### DiagramLinks Attributes

| Attribute   | Type                                 | Notes                                                                           |
|-------------|--------------------------------------|---------------------------------------------------------------------------------|
| ConnectorID | Long                                 | Read/Write. The ID of the associated connector.                                 |
| DiagramID   | Long                                 | Read/Write. The local ID for the associated diagram.                            |
| Geometry    | String                               | Read/Write. The geometry associated with the current connector in this diagram. |
| InstanceID  | Long                                 | Read only. Holds the connector identifier for the current model.                |
| IsHidden    | Boolean                              | Read/Write. Flag to indicate if this item is hidden or not.                     |
| ObjectType  | <a href="#">ObjectType</a><br>[1835] | Read only. Distinguishes objects referenced through a Dispatch interface.       |
| Path        | String                               | Read/Write. The path of the connector in this diagram.                          |
| Style       | String                               | Read/Write. Additional style information; for example, color, thickness.        |

#### DiagramLinks Methods

| Method          | Type    | Notes                                                                                                                                                                                     |
|-----------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GetLastError () | String  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs.     |
| Update ()       | Boolean | Update the current <i>DiagramLink</i> object after modification or appending a new item.<br><br>If <b>false</b> is returned, check the <i>GetLastError</i> function for more information. |

#### 18.2.2.8.4 SwimlaneDef Class

A *SwimlaneDef* object makes available attributes relating to a single row or column in a list of swimlanes.

| Attribute             | Type                                 | Notes                                                                                                         |
|-----------------------|--------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>Bold</b>           | <i>Boolean</i>                       | Read/Write. Show the title text in bold.                                                                      |
| <b>FontColor</b>      | <i>Long</i>                          | Read/Write. RGB color used to draw the titles.                                                                |
| <b>HideClassifier</b> | <i>Boolean</i>                       | Read/Write. Removes any classifier from title display.                                                        |
| <b>HideNames</b>      | <i>Boolean</i>                       | Read/Write. Set to true to hide the swimlane titles.                                                          |
| <b>LineColor</b>      | <i>Long</i>                          | Read/Write. RGB color used to draw swimlane borders.                                                          |
| <b>LineWidth</b>      | <i>Long</i>                          | Read/Write. Width of line, in pixels, used to draw swimlanes. Valid values: <b>1</b> , <b>2</b> or <b>3</b> . |
| <b>Locked</b>         | <i>Boolean</i>                       | Read/Write. If set to true, disables user modification of the swimlanes via the diagram.                      |
| <b>ObjectType</b>     | <a href="#">ObjectType</a><br>[1835] | Read only. Distinguishes objects referenced through a Dispatch interface.                                     |
| <b>Orientation</b>    | <i>String</i>                        | Read/Write. Indication of whether the swimlanes are vertical or horizontal.                                   |
| <b>ShowInTitleBar</b> | <i>Boolean</i>                       | Read/Write. Enables vertical swimlane titles to be shown in title bar.                                        |
| <b>Swimlanes</b>      | <a href="#">Swimlanes</a><br>[1927]  | Read/Write. A list of individual swimlanes.                                                                   |

#### 18.2.2.8.5 Swimlanes Class

A *Swimlanes* object is attached to a diagram's **SwimlaneDef** object and provides a mechanism to access individual swimlanes.

##### Swimlanes Attributes

| Attribute         | Type                                 | Notes                                                                     |
|-------------------|--------------------------------------|---------------------------------------------------------------------------|
| <b>Count</b>      | <i>Long</i>                          | Read/Write. Gives the number of swimlanes.                                |
| <b>ObjectType</b> | <a href="#">ObjectType</a><br>[1835] | Read only. Distinguishes objects referenced through a Dispatch interface. |

Swimlanes Methods

| Method                                               | Type                                                                   | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------|------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Add (string Title, long Width)</b>                | <a href="#">Swimlane</a><br><small>[1928]</small>                      | Adds a new swimlane to the end of the list. Returns a swimlane object representing the newly added entry.<br><br>Parameters: <ul style="list-style-type: none"> <li>Title: String - The title text that appears at the top of the swimlane. Can be the same as an existing swimlane title.</li> <li>Width: Long - The width of the swimlane in pixels.</li> </ul>                                                                                                               |
| <b>Delete (object Index)</b>                         | <i>Void</i>                                                            | Deletes a selected swimlane.<br><br>If the string matches more than one entry, only the first entry is deleted.<br><br>Parameter: <ul style="list-style-type: none"> <li>Index: Object - Either a string representing the title text or an integer representing the zero-based index of the swimlane to delete.</li> </ul>                                                                                                                                                      |
| <b>DeleteAll ()</b>                                  | <i>Void</i>                                                            | Removes all swimlanes.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Insert (long Index, string Title, long Width)</b> | <a href="#">Swimlane</a><br><small>[1928]</small>                      | Inserts a swimlane at a specific position. Returns a swimlane object representing the newly added entry.<br><br>Parameters: <ul style="list-style-type: none"> <li>Index: Long - The zero-based index of the existing Swimlane before which this new entry is inserted.</li> <li>Title: String - The title text which appears at the top of the swimlane. Can be the same as an existing swimlane title.</li> <li>Width: Long - The width of the swimlane in pixels.</li> </ul> |
| <b>Items (object Index)</b>                          | <a href="#">Swimlane</a><br><small>[1928]</small><br><i>collection</i> | Accesses an individual swimlane.<br><br>If the string matches more than one swimlane title, the first matching swimlane is returned.<br><br>Parameter: <ul style="list-style-type: none"> <li>Index: Object - Either a string representing the title text or an integer representing the zero-based index of the swimlane to get.</li> </ul>                                                                                                                                    |

### 18.2.2.9 Project Interface Package

The *Enterprise Architect.Project* interface. This is the XML-based interface to Enterprise Architect elements; it also includes some utility functions. You can get a pointer to this interface using the *Repository*. *GetProjectInterface* method.

Example:

#### 18.2.2.9.1 Project Class

The Project interface can be accessed from the Repository using *GetProjectInterface()*. The returned interface provides access to the XML-based Enterprise Architect Automation Interface. Use this interface to get XML for the various internal elements and to run some utility functions to perform tasks such as load diagrams or run reports.

Notes:

- These methods all require input GUIDs in XML format; use **GUIDtoXML** to change the Enterprise Architect GUID to an XML GUID

**Learn More:**

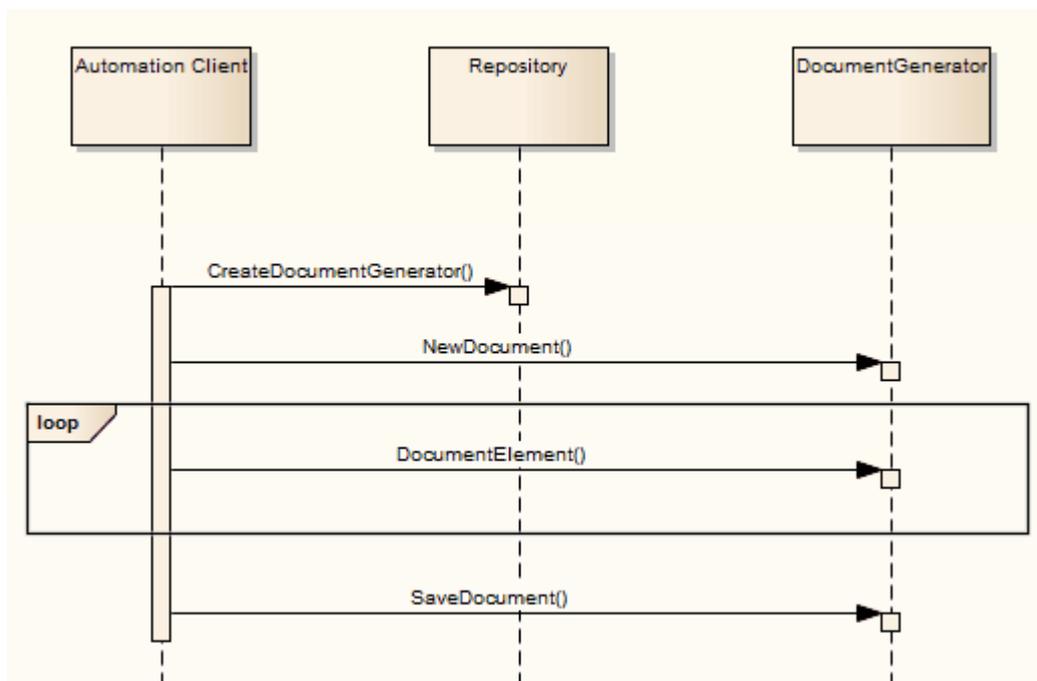

- [GUIDtoXML](#) [1939]

### 18.2.2.10 Document Generator Interface Package

The *Enterprise Architect.DocumentGenerator* interface. This is the XML-based interface to Enterprise Architect RTF and HTML reporting. You can get a pointer to this interface using the *Repository.CreateDocumentGenerator* method.

The following diagram illustrates how you might apply this interface in generating a report through the Automation Interface.

**Example:**

#### 18.2.2.10.1 DocumentGenerator Class

The *DocumentGenerator* Class can be accessed from the *Repository* using *CreateProjectGenerator()*. The returned interface provides access to the XML-based Enterprise Architect Automation Interface. Use this interface to get XML for the various internal elements and to run some utility functions to perform tasks such as load diagrams or run reports.

**DocumentGenerator Attributes:**

| Attribute         | Type                                             | Notes                                                                     |
|-------------------|--------------------------------------------------|---------------------------------------------------------------------------|
| <b>ObjectType</b> | <a href="#">ObjectType</a> <small>[1835]</small> | Read only. Distinguishes objects referenced through a Dispatch interface. |

Document Generator Methods:

| Method                                                                       | Type           | Notes                                                                                                                                                                                                                                                                                                      |
|------------------------------------------------------------------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DocumentDiagram (long DiagramID, long nDepth, string templateName)</b>    | <i>Boolean</i> | Documents a diagram.<br>Parameters: <ul style="list-style-type: none"> <li>DiagramId: Long - the ID of the diagram.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting diagrams; can be blank.</li> </ul>                      |
| <b>DocumentElement (long ElementID, long nDepth, string templateName)</b>    | <i>Boolean</i> | Documents an element.<br>Parameters: <ul style="list-style-type: none"> <li>ElementId: Long - the ID of the element.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting elements; can be blank.</li> </ul>                     |
| <b>DocumentModelAuthor (string name, long nDepth, string templateName)</b>   | <i>Boolean</i> | Documents a model author.<br>Parameters: <ul style="list-style-type: none"> <li>Name: String - the name of the author.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting model authors; can be blank.</li> </ul>              |
| <b>DocumentModelClient (string name, long nDepth, string templateName)</b>   | <i>Boolean</i> | Documents a single model client.<br>Parameters: <ul style="list-style-type: none"> <li>Name: String - the name of the client.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting model clients; can be blank.</li> </ul>       |
| <b>DocumentModelGlossary (long id, long nDepth, string templateName)</b>     | <i>Boolean</i> | Documents a single model glossary term.<br>Parameters: <ul style="list-style-type: none"> <li>id: Long - the ID of the term.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting model glossary terms; can be blank.</li> </ul> |
| <b>DocumentModelIssue (long id, long nDepth, string templateName)</b>        | <i>Boolean</i> | Documents a single model issue.<br>Parameters: <ul style="list-style-type: none"> <li>id: Long - the ID of the issue.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting model issues; can be blank.</li> </ul>                |
| <b>DocumentModelResource (string name, long nDepth, string templateName)</b> | <i>Boolean</i> | Documents a single model resource.<br>Parameters: <ul style="list-style-type: none"> <li>Name: String - the name of the resource.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting model resources; can be blank.</li> </ul> |

| Method                                                                    | Type           | Notes                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------------------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DocumentModelRole</b> (string name, long nDepth, string templateName)  | <i>Boolean</i> | Documents a single model role.<br>Parameters: <ul style="list-style-type: none"> <li>Name: String - the name of the role.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting model roles; can be blank.</li> </ul>                                                             |
| <b>DocumentModelTask</b> (long id, long nDepth, string templateName)      | <i>Boolean</i> | Documents a single model task.<br>Parameters: <ul style="list-style-type: none"> <li>id: Long - the ID of the the task.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting model tasks; can be blank.</li> </ul>                                                               |
| <b>DocumentPackage</b> (long PackageID, long nDepth, string templateName) | <i>Boolean</i> | Documents a package.<br>Parameters: <ul style="list-style-type: none"> <li>PackageId: Long - the ID of the package.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting packages; can be blank.</li> </ul>                                                                      |
| <b>GetLastError()</b>                                                     | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object.                                                                                                                                                                                                                                                          |
| <b>InsertBreak</b> (enum breakType)                                       | <i>Boolean</i> | Inserts a break into the report at the current location.<br>Parameters: <ul style="list-style-type: none"> <li>breakType: enum - <b>0</b> = page break, <b>1</b> = section break.</li> </ul>                                                                                                                                                               |
| <b>InsertLinkedDocument</b> (string guid)                                 | <i>Boolean</i> | Inserts a linked document into the report at the current location.<br><br>A linked document can used to set the header and footer of the report. These are taken from the first linked document added to the report.<br>Parameters: <ul style="list-style-type: none"> <li>guid: String - the GUID of the element that has a linked document.</li> </ul>   |
| <b>InsertTableOfContents</b>                                              | <i>Boolean</i> | Inserts a Table of Contents at the current position.                                                                                                                                                                                                                                                                                                       |
| <b>InsertTeamReviewPost</b> (string path)                                 | <i>Boolean</i> | Inserts a Team Review posting into the report at the current location.<br>Parameters: <ul style="list-style-type: none"> <li>path: String - the path of the Team Review post.</li> </ul>                                                                                                                                                                   |
| <b>InsertText</b> (string Text, string style)                             | <i>Boolean</i> | Inserts some static text into the report at the current location.<br><br>No carriage return is added, so remember to add one if required.<br>Parameters: <ul style="list-style-type: none"> <li>Text: String - the static text to be inserted.</li> <li>Style: String - the name of the style in the template; defaults to <i>Normal</i> style.</li> </ul> |

| Method                                                    | Type           | Notes                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NewDocument (string templateName)</b>                  | <i>Boolean</i> | Starts a new document; must be called before attempting to document anything else.<br><br>Parameters:<br><ul style="list-style-type: none"> <li>templateName: String - a template to use when documenting elements. Can be blank.</li> </ul>                                                                                                     |
| <b>ReplaceField (string fieldname, string fieldvalue)</b> | <i>Boolean</i> | Updates the fieldname with the value given.<br><br>If you call this function more than once with the same fieldname, the field only has the last value set.<br><br>Parameters:<br><ul style="list-style-type: none"> <li>fieldname: String - the fieldname to find.</li> <li>fieldvalue: String - the value to insert into the field.</li> </ul> |
| <b>SaveDocument (string filename, enum nDocType)</b>      | <i>Boolean</i> | Saves the document to disk.<br><br>Parameters:<br><ul style="list-style-type: none"> <li>filename: String - the filename to save the file to.</li> <li>nDocType: Enum - <b>0</b> = RTF, <b>1</b> = HTML.</li> </ul>                                                                                                                              |

### 18.2.2.11 Mail Interface Package

The Enterprise Architect *MailInterface* package contains:

- A function to retrieve a pointer to the interface
- Functions to create and send a mail message within the current mode
- Utility functions for creating hyperlinks to selected model elements

You can get a pointer to this interface using the method **Repository.GetMailInterface**.

#### Learn more:

- [Repository Package](#) <sup>[1838]</sup>
- [MailInterface Class](#) <sup>[1950]</sup>

#### 18.2.2.11.1 MailInterface Class

The *MailInterface* interface can be accessed from the Repository using **GetMailInterface()**. The returned interface provides access to the Enterprise Architect Model Mail Interface. Use this interface to automate the process of creating and sending messages using Enterprise Architect's Model Mail system.

#### MailInterface Attributes:

| Attribute               | Type                                             | Notes                                                                          |
|-------------------------|--------------------------------------------------|--------------------------------------------------------------------------------|
| <b>ObjectType</b>       | <a href="#">ObjectTyp</a><br><sup>e</sup> [1835] | Read Only<br><br>Distinguishes objects referenced through a dispatch interface |
| <b>MessagingEnabled</b> | Boolean                                          | Read Only<br><br>Advises whether messaging is enabled on the current model     |

#### MailInterface Methods:

| Method                                                               | Type          | Notes                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ( )</b>                                              | <i>String</i> | Returns the last error message set for the MailInterface                                                                                                                                                                                                                                                                                                     |
| <b>GetRecipientGUID (string UserName)</b>                            | <i>String</i> | Returns the GUID of the specified Enterprise Architect user<br>Parameters: <ul style="list-style-type: none"> <li>• UserName: String - The name of a user defined in the current model</li> </ul>                                                                                                                                                            |
| <b>GetElementHyperlink (string ElementGUID, string LinkText)</b>     | <i>String</i> | Returns a string containing a hyperlink to the element specified by the input parameter ElementGUID<br>Parameters: <ul style="list-style-type: none"> <li>• ElementGUID: String - The GUID of the element for which a hyperlink is required</li> <li>• LinkText: String - The text to display for the hyperlink (e.g. the element name)</li> </ul>           |
| <b>GetAttributeHyperlink (string AttributeGUID, string LinkText)</b> | <i>String</i> | Returns a string containing a hyperlink to the attribute specified by the input parameter AttributeGUID<br>Parameters: <ul style="list-style-type: none"> <li>• AttributeGUID: String - The GUID of the attribute for which a hyperlink is required</li> <li>• LinkText: String - The text to display for the hyperlink (e.g. the attribute name)</li> </ul> |
| <b>GetMethodHyperlink (string MethodGUID, string LinkText)</b>       | <i>String</i> | Returns a string containing a hyperlink to the method specified by the input parameter MethodGUID<br>Parameters: <ul style="list-style-type: none"> <li>• MethodGUID: String - The GUID of the method for which a hyperlink is required</li> <li>• LinkText: String - The text to display for the hyperlink (e.g. the method name)</li> </ul>                |
| <b>GetDiagramHyperlink (string DiagramGUID, string LinkText)</b>     | <i>String</i> | Returns a string containing a hyperlink to the diagram specified by the input parameter DiagramGUID<br>Parameters: <ul style="list-style-type: none"> <li>• DiagramGUID: String - The GUID of the diagram for which a hyperlink is required</li> <li>• LinkText: String - The text to display for the hyperlink (e.g. the diagram name)</li> </ul>           |
| <b>GetPackageHyperlink (string PackageGUID, string LinkText)</b>     | <i>String</i> | Returns a string containing a hyperlink to the package specified by the input parameter PackageGUID<br>Parameters: <ul style="list-style-type: none"> <li>• PackageGUID: String - The GUID of the package for which a hyperlink is required</li> <li>• LinkText: String - The text to display for the hyperlink (e.g. the package name)</li> </ul>           |
| <b>GetFileHyperlink (string FilePath, string LinkText)</b>           | <i>String</i> | Returns a string containing a hyperlink to the file specified by the input parameter FilePath<br>Parameters: <ul style="list-style-type: none"> <li>• FilePath: String - The path name of the file for which a hyperlink is required</li> <li>• LinkText: String - The text to display for the hyperlink (e.g. The</li> </ul>                                |

| Method                                                                                                                                | Type    | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Introduction</b> | <p>Add-Ins enable you to add functionality to Enterprise Architect. The Enterprise Architect Add-In model builds on the features provided by the <b>Automation Interface</b> to enable you to extend the Enterprise Architect user interface.</p> <p>Add-Ins are ActiveX COM objects that expose public Dispatch methods. They have several advantages over stand-alone automation clients:</p> <ul style="list-style-type: none"> <li>• Add-Ins can define Enterprise Architect menus and sub-menus</li> <li>• Add-Ins receive notifications about various Enterprise Architect user-interface events including menu clicks and file changes</li> <li>• Add-Ins can (and should) be written as in-process (DLL) components. This provides lower call overhead and better integration into the Enterprise Architect environment</li> <li>• Because a current version of Enterprise Architect is already running there is no requirement to start a second copy of Enterprise Architect via the automation interface</li> <li>• Because the Add-In receives object handles associated with the currently running copy of Enterprise Architect, more information is available about the current user's activity; for example, which diagram objects are selected</li> <li>• You are not required to do anything other than to install the Add-In to make it usable; that is, you do not have to configure Add-Ins to run on your systems</li> <li>• Because Enterprise Architect is constantly evolving in response to customer requests, the Add-In interface is flexible:</li> <li>• The Add-In interface does not have its own version, rather it is identified by the version of Enterprise Architect it first appeared in; for example, the current version of the Enterprise Architect Add-In interface is version 2.1</li> <li>• When creating your Add-In, you do not have to subscribe to a type-library</li> </ul> <p>From Enterprise Architect release 7.0 Add-Ins created before 2004 are no longer supported. If an Add-In subscribes to the Addn_Tmpl.tlb interface (2003 style), it fails on load. In this event, contact the vendor or author of the Add-In and request an upgrade.</p> <ul style="list-style-type: none"> <li>• Add-Ins do not have to implement methods that they never use</li> <li>• Add-Ins prompt users via context menus in the tree view and the diagram</li> <li>• Menu check and disable states can be controlled by the Add-In</li> </ul> <p>Add-Ins enhance the existing functionality of Enterprise Architect through a variety of mechanisms such as <b>Scripts</b>, <b>UML Profiles</b> and the <b>Automation Interface</b>. Once an <b>Add-In</b> is registered, it can be</p> | <p><a href="#">Automation Interface</a> <sup>[1822]</sup></p> <p><a href="#">Scripts</a> <sup>[1817]</sup></p> <p><a href="#">UML Profiles</a> <sup>[1039]</sup></p> <p><a href="#">Registered Add-in</a> <sup>[2101]</sup></p> <p><a href="#">Add-In Manager</a> <sup>[1974]</sup></p> |

|                           | Register an Add-In(developed in-house or brought-in) | <a href="#">Register an Add-In</a> <sup>[2101]</sup>     |
|                           | The Add-In Manager                                   | <a href="#">The Add-In Manager</a> <sup>[1974]</sup>     |

#### **18.3.1.1 Create Add-Ins**

Before you start you must have an application development tool that is capable of creating ActiveX COM objects supporting the IDispatch interface, such as:

- Borland Delphi
- Microsoft Visual Basic
- Microsoft Visual Studio .Net.

You should consider how to **define menu items**. To help with this, you could review some **examples of Automation Interfaces** (this web page provides examples of code used to create Add-Ins for Enterprise Architect).

**How to:**

An Enterprise Architect Add-In can be created in four steps:

| Step | Action                                                                                                                                                         | See also                                                   |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
| 1    | Use a development tool to create an ActiveX COM DLL project. Visual Basic users, for example, choose <i>File&gt;Create New Project-ActiveX DLL</i> .           |                                                            |
| 2    | Connect to the interface using the syntax appropriate to the language as detailed in the <b>Connect to the Interface</b> topic.                                | <a href="#">Connect to the Interface</a> <sup>[1823]</sup> |
| 3    | Create a COM Class and implement each of the <b>general Add-In Events</b> applicable to your Add-In. You only have to define methods for events to respond to. | <a href="#">Add-In Events</a> <sup>[1976]</sup>            |
| 4    | Add a registry key that identifies your Add-In to Enterprise Architect, as described in the <b>Deploy Add-Ins</b> topic.                                       | <a href="#">Deploy Add-Ins</a> <sup>[1970]</sup>           |

**18.3.1.1.1 Define Menu Items****Topics:**

| Topic                      | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defining Menu Items</b> | <p>Menu items are defined by responding to the <i>GetMenuItems</i> event.</p> <p>The first time this event is called, <i>MenuName</i> is an empty string, representing the top-level menu. For a simple Add-In with just a single menu option you can return a string; for example:</p> <pre>Function EA_GetMenuItems(Repository as EA.Repository, MenuLocation As String, MenuName As String) As Variant     EA_GetMenuItems = "&amp;Joe's Add-In" End Function</pre>                                                                                                                                                                                                                                                                    |
| <b>Defining Sub-Menus</b>  | <p>To define sub-menus, prefix a parent menu with a dash. Parent and sub-items are defined as follows:</p> <pre>Function EA_GetMenuItems(Repository as EA.Repository, MenuLocation As String, MenuName As String) As Variant     Select Case MenuName         Case ""             ' Parent Menu Item             EA_GetMenuItems = "- &amp;Joe's Add-In"         Case "- &amp;Joe's Add-In"             ' Define Sub-Menu Items using the Array notation.             ' In this example, "Diagram" and "Treeview"             compose the "Joe's Add-In" sub-menu.             EA_GetMenuItems = Array("&amp;Diagram", "&amp;Treeview")         Case Else             MsgBox "Invalid Menu", vbCritical     End Select End Function</pre> |

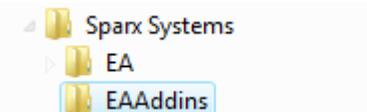

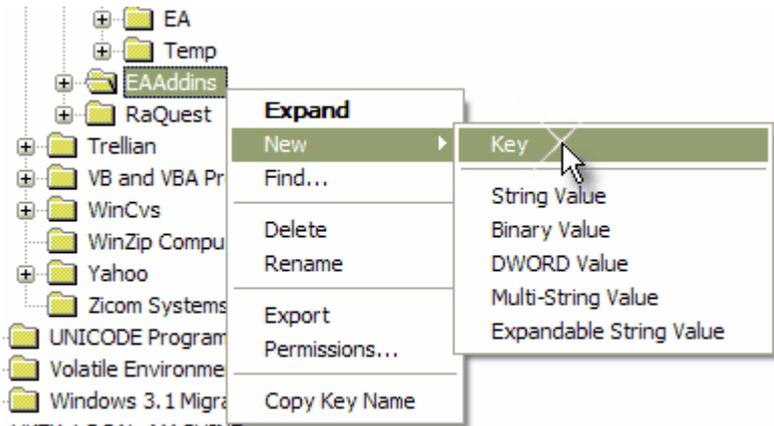

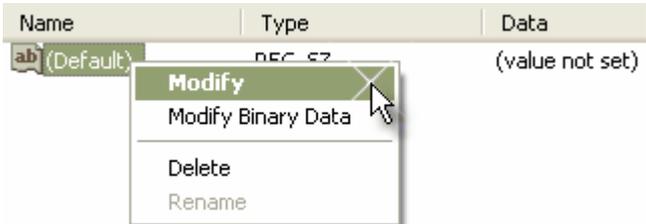

| Topic                                  | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defining further Sub-Menus</b>      | <p>Similarly, you can define further sub-items:</p> <pre> Function EA_GetMenuItems(Repository As EA.Repository, MenuLocation As String, MenuName As String) As Variant     Select Case MenuName         Case ""             EA_GetMenuItems = "- Joe's Add-In"         Case "- Joe's Add-In"             EA_GetMenuItems = Array("- &amp;Diagram", "&amp;TreeView")         Case "- &amp;Diagram"             EA_GetMenuItems = "&amp;Properties"         Case Else             MsgBox "Invalid Menu", vbCritical         End Select     End Function </pre>                                                                                                                                                                                                                  |
| <b>Enabling/Disabling menu options</b> | <p>To enable or disable menu options by default, you can use this method to show particular items to the user:</p> <pre> Sub EA_GetMenuState(Repository As EA.Repository, Location As String, MenuName As String, ItemName As String, IsEnabled As Boolean, IsChecked As Boolean)     Select Case Location         Case "TreeView"             ' Always enable         Case "Diagram"             ' Always enable         Case "MainMenu"             Select Case ItemName                 Case "&amp;Translate", "Save &amp;Project"                     If GetIsProjectSelected() Then                         IsEnabled = False                     End If             End Select         End Select     End Select     IsChecked = GetIsCurrentSelection() End Sub </pre> |

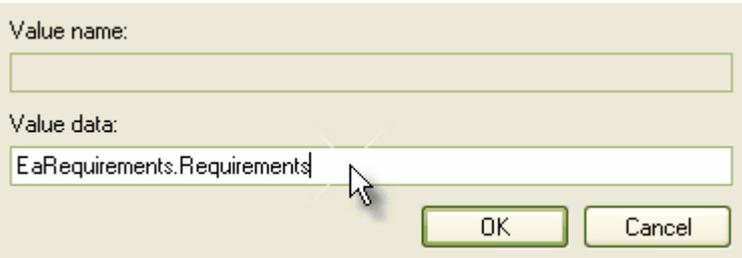

### 18.3.1.1.2 Deploy Add-Ins

#### How to:

To deploy Add-Ins to users' sites, follow the steps below

| Step | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | See also |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 1    | Add the Add-In DLL file to an appropriate directory on the user's computer; that is, C:\Program Files\ ( new dir ) .                                                                                                                                                                                                                                                                                                                                                                |          |
| 2    | <p>Register the DLL as appropriate to your platform:</p> <ul style="list-style-type: none"> <li>If compiled as a native Win32 DDL, such as VB6 or C++, register the DDL using the <b>regsvr32</b> command from the command prompt; for example: <pre>regsvr32 "C:\Program Files\MyCompany\EAAAddIn\EAAAddIn.dll"</pre> </li> <li>If compiled as a .NET DLL, such as C# or VB.NET, register the DLL using the <b>RegAsm</b> command from the command prompt; for example:</li> </ul> |          |

| Step | Action                                                                                                                                                                                                                                                                                                                                                               | See also |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|      | <pre>C:\WINDOWS\Microsoft.NET\Framework\v2.0.50727\RegAsm.exe "C:\Program Files\MyCompany\EAAddin\EAAddin.dll" / codebase</pre>                                                                                                                                                                                                                                      |          |
| 3    | Place a new entry into the registry using the registry editor (run <b>regedit</b> ) so that Enterprise Architect recognizes the presence of your Add-In.                                                                                                                                                                                                             |          |
| 4    | <p>1. Add a new key value <b>EAAddins</b> under the location:</p> <ul style="list-style-type: none"> <li>• <i>HKEY_CURRENT_USER\Software\Sparx Systems</i> for single users</li> <li>• <i>HKEY_LOCAL_MACHINE\Software\Sparx Systems</i> for multiple users on a machine</li> </ul>  |          |
| 5    | <p>Add a new key under this key with the project name.</p>  <p>( <i>ProjectName</i> ) is not necessarily the name of your DLL, but the name of the Project; in Visual Basic, this is the value for the property <b>Name</b> corresponding to the project file</p>                 |          |
| 6    | <p>Specify the default value by modifying the default value of the key.</p>                                                                                                                                                                                                       |          |
| 7    | <p>Enter the value of the key by typing in the ( <i>project name</i> ) . ( <i>class name</i> ) ; for example, <i>EaRequirements.Requirements</i>, where <i>EaRequirements</i> is the project name, as shown in the example below.</p>                                                                                                                                |          |

| Step | Action                                                                             | See also |

| Topic                              | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | See Also |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| <b>Visual Basic 5/6 Users Note</b> | <p>Visual Basic 5/6 users should note that the version number of the Enterprise Architect interface is stored in the VBP project file in a form similar to the following:</p> <pre>Reference=* \ G{ 64FB2BF4- 9EFA- 11 D2- 8307- C4558600000} #2. 2#0# . . . \ . . . \ Program Files\ Sparx Systems\ EA\ EA. TLB#Enterprise Architect Object Model 2. 02</pre> <p>If you experience problems moving from one version of Enterprise Architect to another, open the VBP file in a text editor and remove this line. Then open the project in Visual Basic and use <i>Project-References</i> to create a new reference to the Enterprise Architect Object model.</p>                                                                                                                                                                                                                                                                                        |          |
| <b>Add-In Fails to Load</b>        | <p>From Enterprise Architect release 7.0, Add-Ins created before 2004 are no longer supported. If an Add-In subscribes to the <code>Addn_TmpI . t l b</code> interface (2003 style), it fails on load. In this event, contact the vendor or author of the Add-In and request an upgrade.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |          |
| <b>Holding State Information</b>   | <p>It is possible for an Add-In to hold state information, meaning that data can be stored in member variables in response to one event and retrieved in another. There are some dangers in doing this:</p> <ul style="list-style-type: none"> <li>• Enterprise Architect Automation Objects do not update themselves in response to user activity, to activity on other workstations, or even to the actions of other objects in the same automation client. Retaining handles to such objects between calls can result in the second event querying objects that have no relationship with the current state of Enterprise Architect</li> <li>• When you close Enterprise Architect, all Add-Ins are asked to shut down. If there are any external automation clients Enterprise Architect must stay active, in which case all the Add-Ins are reloaded, losing all the data</li> <li>• Enterprise Architect acting as an automation client</li> </ul> |          |

| Topic                                          | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | See Also                                                                                                                                                                                |

|                                                | <p>does not close if an Add-In still holds a reference to it (releasing all references in the <code>Disconnect()</code> event avoids this problem)</p> <p>It is recommended that unless there is a specific reason for doing so, the Add-In should use the repository parameter and its method and properties to provide the necessary data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                         |
| <p><b>Enterprise Architect Not Closing</b></p> | <p><b>.Net Specific Issues</b></p> <p>Automation checks the use of objects and won't enable any of them to be destroyed until they are no longer being used.</p> <p>As noted in the <b>Automation Interface</b> topic, if your automation controller was written using the .NET framework, Enterprise Architect does not close even after you release all your references to it. To force the release of the COM pointers, call the memory management functions as shown below:</p> <pre>GC. Collect(); GC. WaitForPendingFinalizers();</pre> <p>Additionally, because automation clients hook into Enterprise Architect, which creates Add-Ins which in turn hook back into Enterprise Architect, it is possible to get into a deadlock situation where Enterprise Architect and the Add-Ins won't let go of one another and keep each other active. An Add-In might retain hooks into Enterprise Architect because:</p> <ul style="list-style-type: none"> <li>• It keeps a private reference to an Enterprise Architect object (see <b>Holding State Information</b> above), or</li> <li>• It has been created by .NET and the GC mechanism hasn't got around to releasing it.</li> </ul> <p>There are two actions required to avoid deadlock situations:</p> <ul style="list-style-type: none"> <li>• Automation controllers must call <code>Repository.CloseAddIns()</code> at some point (presumably at the end of processing).</li> <li>• Add-Ins must release all references to Enterprise Architect in the <code>Disconnect()</code> event. See the <b>Add-In Events</b> topic for details.</li> </ul> <p>It is possible that your Automation client controls a running instance of Enterprise Architect where the Add-Ins have not complied with the rule above. In this case you could call <code>Repository.Exit()</code> to terminate Enterprise Architect.</p> <p><b>Miscellaneous</b></p> <p>In developing Add-Ins using the .Net framework you must select COM Interoperability in the project's properties in order for it to be recognized as an Add-In.</p> <p>Some development environments do not automatically register COM DLLs on creation. You might have to do that manually before Enterprise Architect recognizes the Add-In.</p> <p>You can use your private Add-In key (as required for Add-In deployment) to store configuration information pertinent to your Add-In.</p> | <p><a href="#">Automation Interface</a> <sup>[1826]</sup></p> <p><a href="#">Holding State Information</a> <sup>[1972]</sup></p> <p><a href="#">Add-In Events</a> <sup>[1976]</sup></p> |
| <p><b>Concurrent Calls</b></p>                 | <p>In Enterprise Architect releases up to release 7.0, there is a possibility that Enterprise Architect could call two Add-In methods concurrently if the Add-In calls:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                         |

|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| Details | <p>EA_Connect events enable Add-Ins to identify their type and to respond to Enterprise Architect start up.</p> <p>This event occurs when Enterprise Architect first loads your Add-In. Enterprise Architect itself is loading at this time so that while a Repository object is supplied, there is limited information that you can extract from it.</p> <p>The chief uses for EA_Connect are in initializing global Add-In data and for identifying the Add-In as an <b>MDG Add-In</b>.</p> <p>Also look at <b>EA_Disconnect</b>.</p> | <p><a href="#">MDG Add-In</a> <sup>[2042]</sup></p> <p><a href="#">EA_Disconnect</a> <sup>[1977]</sup></p> |

#### Syntax

#### Function EA\_Connect(Repository As EA.Repository) As String

The *EA\_Connect* function syntax has the following elements:

| Parameter  | Type                                            | Direction | Description                                                                                                                                                        |
|------------|-------------------------------------------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Repository | <a href="#">EA.Repository</a> <sup>[1855]</sup> | IN        | An EA.Repository object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |

#### Return Value

String identifying a specialized type of Add-In:

| Type  | Details                                                                                  |
|-------|------------------------------------------------------------------------------------------|
| "MDG" | MDG Add-Ins receive <a href="#">MDG Events</a> <sup>[2042]</sup> and extra menu options. |
| ""    | None-specialized Add-In.                                                                 |

|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Details | <p>The <i>EA_GetMenuItems</i> event enables the Add-In to provide the Enterprise Architect user interface with additional Add-In menu options in various context and main menus. When a user selects an Add-In menu option, an event is raised and passed back to the Add-In that originally defined that menu option.</p> <p>This event is raised just before Enterprise Architect has to show particular menu options to the user, and its use is described in the <b>Define Menu Items</b> topic.</p> | <p><a href="#">Define Menu Items</a><sup>[1969]</sup></p> <p><a href="#">EA_MenuClick</a><sup>[1980]</sup></p> <p><a href="#">EA_GetMenuState</a><sup>[1979]</sup></p> |

### Syntax

*Function* EA\_GetMenuItems(*Repository As EA.Repository, MenuLocation As String, MenuName As String*) *As Variant*

The *EA\_GetMenuItems* function syntax has the following elements:

| Parameter    | Type                                            | Direction | Description                                                                                                                                                        |
|--------------|-------------------------------------------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MenuLocation | String                                          |           | String representing the part of the user interface that brought up the menu. Can be <i>TreeView</i> , <i>MainMenu</i> or <i>Diagram</i> .                          |
| MenuName     | String                                          |           | The name of the parent menu for which sub-items are to be defined. In the case of the top-level menu it is an empty string.                                        |
| Repository   | <a href="#">EA.Repository</a> <sup>[1855]</sup> | IN        | An EA.Repository object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |

### Return Value

One of the following types:

- A string indicating the label for a single menu option.
- An array of strings indicating a multiple menu options.
- Empty (Visual Basic/VB.NET) or null (C#) to indicate that no menu should be displayed

In the case of the top-level menu it should be a single string or an array containing only one item, or Empty/null.

### 18.3.4.4 EA\_GetMenuState

#### Topics:

| Topic          | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | See Also                                                                                              |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Details</b> | <p>The <i>EA_GetMenuState</i> event enables the Add-In to set a particular menu option to either enabled or disabled. This is useful when dealing with locked packages and other situations where it is convenient to show a menu option, but not enable it for use.</p> <p>This event is raised just before Enterprise Architect has to show particular menu options to the user. Its use is described in the <b>Define Menu Items</b> topic.</p> <p>Also look at <b>EA_GetMenuItems</b>.</p> | <p><a href="#">Define Menu Items</a><br/>[1969]</p> <p><a href="#">EA_GetMenuItems</a><br/>[1978]</p> |

#### Syntax

*Sub EA\_GetMenuState(Repository as EA.Repository, MenuLocation As String, MenuName as String, ItemName as String, IsEnabled as Boolean, IsChecked as Boolean)*

The *EA\_GetMenuState* function syntax has the following elements:

| Parameter           | Type                                    | Direction | Description                                                                                                                                                               |
|---------------------|-----------------------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IsChecked</b>    | <i>Boolean</i>                          |           | Boolean. Set to <b>True</b> to check this particular menu option.                                                                                                         |
| <b>IsEnabled</b>    | <i>Boolean</i>                          |           | Boolean. Set to <b>False</b> to disable this particular menu option.                                                                                                      |
| <b>ItemName</b>     | <i>String</i>                           |           | The name of the option actually clicked, for example, <i>Create a New Invoice</i> .                                                                                       |
| <b>MenuLocation</b> | <i>String</i>                           |           | String representing the part of the user interface that brought up the menu. Can be <i>TreeView</i> , <i>MainMenu</i> or <i>Diagram</i> .                                 |
| <b>MenuName</b>     | <i>String</i>                           |           | The name of the parent menu for which sub-items must be defined. In the case of the top-level menu it is an empty string.                                                 |
| <b>Repository</b>   | <a href="#">EA.Repository</a><br>[1858] | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |

### Return Value

None.

### 18.3.4.5 EA\_MenuClick

| Topic   | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | See Also                                                                                                   |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| Details | <p><i>EA_MenuClick</i> events are received by an Add-In in response to user selection of a menu option.</p> <p>The event is raised when the user clicks on a particular menu option. When a user clicks on one of your non-parent menu options, your Add-In receives a <i>MenuClick</i> event, defined as follows:</p> <pre>Sub EA_MenuClick(Repository As EA.Repository, ByVal MenuName As String, ByVal ItemName As String)</pre> <p>The code below illustrates an example of use:</p> <pre>    If MenuName = "- &amp;Diagram" And     ItemName = "&amp;Properties" then         MsgBox Repository.     Get Current Diagram Name, vbInformation     Else         MsgBox "Not Implemented",         vbCritical     End If</pre> <p>Notice that your code can directly access Enterprise Architect data and UI elements using <b>Repository</b> methods.</p> <p>Also look at <b>EA_GetMenuItems</b>.</p> | <p><a href="#">Repository</a><sup>[1855]</sup></p> <p><a href="#">EA_GetMenuItems</a><sup>[1978]</sup></p> |

#### Syntax

**Sub EA\_MenuClick(Repository As EA.Repository, MenuLocation As String, MenuName As String, ItemName As String)**

The *EA\_GetMenuClick* function syntax has the following elements:

| Parameter         | Type                                            | Direction | Description                                                                                                                                                               |
|-------------------|-------------------------------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ItemName</b>   | <i>String</i>                                   |           | The name of the option actually clicked, for example, <i>Create a New Invoice</i> .                                                                                       |
| <b>MenuName</b>   | <i>String</i>                                   |           | The name of the parent menu for which sub-items are to be defined. In the case of the top-level menu it is an empty string.                                               |
| <b>Repository</b> | <a href="#">EA.Repository</a> <sup>[1855]</sup> | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |

#### Return Value

None.

### 18.3.4.6 EA\_OnOutputItemClicked

#### Topics:

|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| Details | <p>The <i>EA_ShowHelp</i> event enables the Add-In to show a help topic for a particular menu option. When the user has an Add-In menu option selected, pressing ( <b>F1</b> ) can be delegated to the required Help topic by the Add-In and a suitable help message shown.</p> <p>This event is raised when the user presses ( <b>F1</b> ) on a menu option that is not a parent menu.</p> <p>Also look at <i>EA_GetMenuItems</i>.</p> | <a href="#">EA_GetMenuItem</a><br><a href="#">s</a> <sup>[1978]</sup> |

#### Syntax

*Sub EA\_ShowHelp(Repository as EA.Repository, MenuLocation As String, MenuName as String, ItemName as String)*

The *EA\_ShowHelp* function syntax contains the following elements:

| Parameter    | Type                                               | Direction | Description                                                                                                                                                               |
|--------------|----------------------------------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ItemName     | String                                             |           | The name of the option actually clicked, for example, <b>Create a New Invoice</b> .                                                                                       |
| MenuLocation | String                                             |           | String representing the part of the user interface that brought up the menu. Can be <b>Treeview</b> , <b>MainMenu</b> or <b>Diagram</b> .                                 |
| MenuName     | String                                             |           | The name of the parent menu for which sub-items are to be defined. In the case of the top-level menu it is an empty string.                                               |
| Repository   | <a href="#">EA.Repository</a><br><sup>[1855]</sup> | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |

#### Return Value

None.

### 18.3.5 Broadcast Events

#### Overview

The following general Broadcast events are sent to all loaded Add-Ins. For an Add-In to receive the event, they must first implement the required automation event interface. If Enterprise Architect detects that the Add-In has the required interface, the event is dispatched to the Add-In.

| Topic                            | Link                                                               |

|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| Details | <p><b>EA_AddinLicenseValidate</b> is broadcast to all Add-Ins, providing them with a chance to use the Add-In key to determine the level of functionality to provide. The event is broadcast in response to a non-standard Enterprise Architect key being entered into the <b>License Management</b> dialog.</p> <p>For the Add-In to validate itself against this key, the Add-In's <b>EA_AddinLicenseValidate</b> handler should return <b>true</b> to advise Enterprise Architect that the license has been validated. The <b>EA_AddinLicenseValidate</b> event is broadcast to all Add-Ins, therefore one license can validate many Add-Ins.</p> <p>If an Add-In elects to handle a license key by returning true to <b>EA_AddinLicenseValidate</b>, it is called upon to provide a description of the license key through the <b>EA_AddinLicenseGetDescription</b> event. If more than one Add-In elects to handle a license key, the first Add-In that returns <b>true</b> to <b>EA_AddinLicenseValidate</b> is queried for the license key description.</p> | <a href="#">EA_AddinLicenseGetDescription</a> <sup>[1986]</sup> |

#### Syntax

**Function** EA\_AddinLicenseValidate(*Repository As EA.Repository, AddinKey As String*) As Boolean

The *EA\_AddinLicenseValidate* function syntax contains the following elements.

| Parameter  | Type                                            | Direction | Description                                                                                                                                                        |
|------------|-------------------------------------------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AddinKey   | String                                          | IN        | The Add-in license key that has been entered in Enterprise Architect's <b>License Management</b> dialog.                                                           |
| Repository | <a href="#">EA.Repository</a> <sup>[1855]</sup> | IN        | An EA.Repository object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |

#### Return Value

For the Add-in to validate against this key it should return **true** to indicate to Enterprise Architect that the key is valid and has been handled.

### 18.3.5.1.2 EA\_AddinLicenseGetDescription

#### Topics:

| Topic   | Detail                                                                                                                                                                                                                                                                                                                                  | See Also |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| Details | Before Enterprise Architect's <b>License Management</b> dialog is displayed, <b>EA_AddinLicenseGetDescription</b> is sent once for each Add-In key to the first Add-In that elected to handle that key. The value returned by <b>EA_AddinLicenseGetDescription</b> is used by Enterprise Architect as the key's plain text description. |          |

#### Syntax

**Function** EA\_AddinLicenseGetDescription (*Repository as EA.Repository, AddinKey as String*) As String

The *EA\_OnPostInitialized* function syntax contains the following elements.

| Parameter  | Type                                            | Direction | Description                                                                                                                                                        |
|------------|-------------------------------------------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AddinKey   | String                                          | IN        | The Add-In license key that Enterprise Architect requires a description for.                                                                                       |
| Repository | <a href="#">EA.Repository</a> <sup>[1855]</sup> | IN        | An EA.Repository object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |

#### Return Value

A String containing a plain text description of the provided AddinKey.

### 18.3.5.2 Compartment Events

Enterprise Architect Add-Ins can respond to the following events associated with user-generated element compartments:

| Topic                         | Link                                                            |
|-------------------------------|-----------------------------------------------------------------|
| EA_QueryAvailableCompartments | <a href="#">EA_QueryAvailableCompartments</a> <sup>[1986]</sup> |
| EA_GetCompartmentData         | <a href="#">EA_GetCompartmentData</a> <sup>[1987]</sup>         |

#### 18.3.5.2.1 EA\_QueryAvailableCompartments

#### Topics:

| Topic   | Detail                                                     | See Also                             |
|---------|------------------------------------------------------------|--------------------------------------|
| Details | This event occurs when Enterprise Architect's diagrams are | <a href="#">EA_GetCompartmentDat</a> |

| Topic | Detail                                                                                                                                                                                                              | See Also                            |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------|
|       | refreshed. It is a request for the Add-In to provide a list of user-defined compartments. The <b>EA_GetCompartmentData</b> event then queries each object for the data to display in each user-defined compartment. | <a href="#">a</a> <sup>[1987]</sup> |

### Syntax

#### Function EA\_QueryAvailableCompartments(*Repository As EA.Repository*) As Variant

The *EA\_QueryAvailableCompartments* function syntax contains the following elements:

| Parameter  | Type                                            | Direction | Description                                                                                                                                                               |
|------------|-------------------------------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Repository | <a href="#">EA.Repository</a> <sup>[1855]</sup> | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |

### Return Value

A *String* containing a comma-separated list of user-defined compartments.

### Example

```
Function EA_QueryAvailableCompartments(Repository As EA.Repository) As Variant
 Dim sReturn As String
 sReturn = ""
 If m_FirstCompartmentVisible = True Then
 sReturn = sReturn + "first,"
 End If
 If m_SecondCompartmentVisible = True Then
 sReturn = sReturn + "second,"
 End If
 If m_ThirdCompartmentVisible = True Then
 sReturn = sReturn + "third,"
 End If

 If Len(sReturn) > 0 Then
 sReturn = Left(sReturn, Len(sReturn) - 1)
 End If

 EA_QueryAvailableCompartments = sReturn
End Function
```

#### 18.3.5.2.2 EA\_GetCompartmentData

### Topics:

| Topic   | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | See Also                                                                          |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| Details | <p>The EA_FileClose event enables the Add-In to respond to a File Close event. When Enterprise Architect closes an opened Model file, this event is raised and passed to all Add-Ins implementing this method.</p> <p>This event occurs when the model currently opened within Enterprise Architect is about to be closed (when another model is about to be opened or when Enterprise Architect is about to shutdown).</p> <p>Also look at <b>EA_FileOpen</b> and <b>EA_FileNew</b>.</p> | <a href="#">EA_FileOpen</a><br>[1994]<br><br><a href="#">EA_FileNew</a><br>[1993] |

#### Syntax

##### Sub EA\_FileClose(Repository As EA.Repository)

The EA\_FileClose function syntax contains the following elements:

| Parameter  | Type                                    | Direction | Description                                                                                                                                                            |
|------------|-----------------------------------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Repository | <a href="#">EA.Repository</a><br>[1855] | IN        | An EA.Repository object representing the Enterprise Architect model about to be closed. Poll its members to retrieve model data and user interface status information. |

#### Return Value

None.

### 18.3.5.5 EA\_FileNew

#### Topics:

| Topic   | Detail                                                                                                                                                                                                                                                                                                                                                                       | See Also                                                                            |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| Details | <p>The EA_FileNew event enables the Add-In to respond to a File New event. When Enterprise Architect creates a new model file, this event is raised and passed to all Add-Ins implementing this method.</p> <p>The event occurs when the model being viewed by the Enterprise Architect user changes, for whatever reason (through user interaction or Add-In activity).</p> | <a href="#">EA_FileClose</a><br>[1993]<br><br><a href="#">EA_FileOpen</a><br>[1994] |

#### Syntax

##### Sub EA\_FileNew(Repository As EA.Repository)

The *EA\_FileNew* function syntax contains the following elements:

| Parameter  | Type                                    | Direction | Description                                                                                                                                                               |
|------------|-----------------------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Repository | <a href="#">EA.Repository</a><br>[1855] | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |

#### Return Value

None.

### 18.3.5.6 *EA\_FileOpen*

#### Topics:

| Topic   | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                    | See Also                                                                                    |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| Details | <p>The <i>EA_FileOpen</i> event enables the Add-In to respond to a <i>File Open</i> event. When Enterprise Architect opens a new model file, this event is raised and passed to all Add-Ins implementing this method.</p> <p>The event occurs when the model being viewed by the Enterprise Architect user changes, for whatever reason (through user interaction or Add-In activity).</p> <p>Also look at <b>EA_FileClose</b> and <b>EA_FileNew</b>.</p> | <p><a href="#">EA_FileClose</a><br/>[1993]</p> <p><a href="#">EA_FileNew</a><br/>[1993]</p> |

#### Syntax

##### *Sub EA\_FileOpen(Repository As EA.Repository)*

The *EA\_FileOpen* function syntax contains the following elements:

| Parameter  | Type                                    | Direction | Description                                                                                                                                                               |
|------------|-----------------------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Repository | <a href="#">EA.Repository</a><br>[1855] | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |

#### Return Value

None.

### 18.3.5.7 EA\_OnPostCloseDiagram

#### Topics:

| Topic   | Detail                                                                                                                      | See Also                                               |
|---------|-----------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| Details | <i>EA_OnPostCloseDiagram</i> notifies Add-Ins that a diagram has been closed.<br>Also look at <i>EA_OnPostOpenDiagram</i> . | <a href="#">EA_OnPostOpenDiagram</a> <sup>[1996]</sup> |

#### Syntax

Function *EA\_OnPostCloseDiagram(Repository As EA.Repository, DiagramID As Integer)*

The *EA\_OnPostCloseDiagram* function syntax contains the following elements:

| Parameter  | Type                                            | Direction | Description                                                                                                                                                                   |
|------------|-------------------------------------------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DiagramID  | <i>Integer</i>                                  | IN        | Contains the Diagram ID of the diagram that was closed.                                                                                                                       |
| Repository | <a href="#">EA.Repository</a> <sup>[1855]</sup> | IN        | An <i>EA.Repository</i> object representing the Enterprise Architect model about to be closed. Poll its members to retrieve model data and user interface status information. |

#### Return Value

None.

### 18.3.5.8 EA\_OnPostInitialized

#### Topics:

| Topic   | Detail                                                                                                                                                                                                                                                             | See Also                                                     |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------|
| Details | <i>EA_OnPostInitialized</i> notifies Add-Ins that the Repository object has finished loading and any necessary initialization steps can now be performed on the object<br>For example, the Add-In can create an Output tab using <i>Repository.CreateOutputTab</i> | <a href="#">Repository.CreateOutputTab</a> <sup>[1860]</sup> |

#### Syntax

Sub *EA\_OnPostInitialized(Repository As EA.Repository)*

The *EA\_OnPostInitialized* function syntax contains the following elements:

| Parameter  | Type                                            | Direction | Description                                                    |
|------------|-------------------------------------------------|-----------|----------------------------------------------------------------|
| Repository | <a href="#">EA.Repository</a> <sup>[1855]</sup> | IN        | An <i>EA.Repository</i> object representing the currently open |

| Parameter | Type | Direction | Description                                                                                                 |
|-----------|------|-----------|-------------------------------------------------------------------------------------------------------------|
|           |      |           | Enterprise Architect model<br>Poll its members to retrieve model data and user interface status information |

#### Return Value

None

### 18.3.5.9 EA\_OnPostOpenDiagram

#### Topics:

| Topic   | Detail                                                                                                                      | See Also                                                |
|---------|-----------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| Details | <b>EA_OnPostOpenDiagram</b> notifies Add-Ins that a diagram has been opened.<br>Also look at <b>EA_OnPostCloseDiagram</b> . | <a href="#">EA_OnPostCloseDiagram</a> <sup>[1995]</sup> |

#### Syntax

**Function** EA\_OnPostOpenDiagram(*Repository As EA.Repository, DiagramID As Integer*)

The *EA\_OnPostOpenDiagram* function syntax contains the following elements:

| Parameter  | Type                                            | Direction | Description                                                                                                                                                               |
|------------|-------------------------------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DiagramID  | <i>Integer</i>                                  | IN        | Contains the Diagram ID of the diagram that was opened.                                                                                                                   |
| Repository | <a href="#">EA.Repository</a> <sup>[1855]</sup> | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |

#### Return Value

None.

### 18.3.5.10 EA\_OnPostTransform

#### Topics:

| Topic   | Detail                                                                                                                                                                                                                                                                                                                                                          | See Also |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| Details | <p><b>EA_OnPostTransform</b> notifies Add-Ins that an MDG transformation has taken place with the output in the specified target package</p> <p>This event occurs when a user runs an MDG transform on one or more target packages; the notification is provided for each transform/target package immediately after all transform processes have completed</p> |          |

#### Syntax

**Function** EA\_OnPostTransform(*Repository As EA.Repository, Info As EA.EventProperties*) *As Boolean*

The *EA\_OnPostTransform* function syntax contains the following elements:

| Parameter  | Type                                                        | Direction | Description                                                                                                                                                                                                                                                                                                                             |
|------------|-------------------------------------------------------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Info       | <a href="#">EA.EventProperties</a><br><small>[1844]</small> | IN        | <p>Contains the following <i>EventProperty Objects</i> for the transform performed:</p> <ul style="list-style-type: none"> <li><i>Transform</i>: A string value corresponding to the name of the transform used</li> <li><i>PackageID</i>: A long value corresponding to <i>Package.PackageID</i> of the destination package</li> </ul> |
| Repository | <a href="#">EA.Repository</a><br><small>[1855]</small>      | IN        | <p>An EA.Repository object representing the currently open Enterprise Architect model</p> <p>Poll its members to retrieve model data and user interface status information</p>                                                                                                                                                          |

#### Return Value

Reserved for future use.

### 18.3.5.11 EA\_OnPreExitInstance

#### Details:

*EA\_OnPreExitInstance* is not currently used.

#### Syntax:

**Sub** EA\_OnPreExitInstance(*Repository As EA.Repository*)

The *EA\_OnPreExitInstance* function syntax contains the following element:

| Parameter  | Type                                                   | Direction | Description                                                                                                                                                               |
|------------|--------------------------------------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Repository | <a href="#">EA.Repository</a><br><small>[1855]</small> | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |

**Return Value:**

None.

**18.3.5.12 EA\_OnRetrieveModelTemplate****Topics:**

| Topic   | Detail                                                                                                                                                                                                                                                          | See Also                                                             |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
| Details | <b>EA_OnRetrieveModelTemplate</b> requests that an Add-In pass a model template to Enterprise Architect<br><br>This event occurs when a user executes the <b>Add a New Model Using Wizard</b> command to add a model that has been defined by an MDG Technology | <a href="#">Incorporate Model Templates</a><br><small>[1087]</small> |

**Syntax**

**Function** EA\_OnRetrieveModelTemplate(*Repository As EA.Repository, sLocation As String*) **As String**

The *EA\_OnRetrieveModelTemplate* function syntax contains the following elements:

| Parameter  | Type                                                   | Direction | Description                                                                                                                                                                    |
|------------|--------------------------------------------------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Repository | <a href="#">EA.Repository</a><br><small>[1855]</small> | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model<br><br>Poll its members to retrieve model data and user interface status information |
| sLocation  | <i>String</i>                                          | IN        | The name of the template requested; this should match the <i>location</i> attribute in the <i>&lt;ModelTemplates&gt;</i> section of an MDG Technology File                     |

**Return Value**

Return a string containing the XML export of the model that is being used as a template

**Example**

```
Public Function EA_OnRetrieveModelTemplate(ByRef Rep As EA.Repository,
ByRef sLocation As String) As String
 Dim sTemplate As String
 Select Case sLocation
 Case "Templates\ Template1.xml "
 sTemplate = My.Resources.Template1
```

```

Case " Templates\ Template2.xml "
 sTemplate = My.Resources.Template2
Case " Templates\ Template3.xml "
 sTemplate = My.Resources.Template3
Case Else
 MsgBox(" Path for " & sLocation & " not found")
 sTemplate = ""
End Select
EA_OnRetrieveModelTemplate = sTemplate
End Function

```

### 18.3.5.13 Model Validation Broadcasts

#### Perform Model Validation from an Add-In

Using Enterprise Architect broadcasts, it is possible to define a set of rules that are evaluated when the user instructs Enterprise Architect to perform model validation. An Add-In that performs model validation would involve the following broadcast events:

| Topic                    | Detail                                                                                                                              | Link                                                       |

### 18.3.5.13.11 Model Validation Example

The following example code is written in C# and provides a skeleton model validation implementation that you might like to use as a starting point in writing your own model validation rules.

#### Main.cs

```
using System;

namespace myAddIn
{
 public class Main
 {
 public Rules theRules;

 public Main()
 {
 theRules = new Rules();
 }

 public string EA_Connect(EA.Repository Repository)
 {
 return "";
 }

 public void EA_Disconnect()
 {
 GC.Collect();
 GC.WaitForPendingFinalizers();
 }

 private bool IsProjectOpen(EA.Repository Repository)
 {
 try
 {
 EA.Collection c = Repository.Models;
 return true;
 }
 }
 }
}
```

```
 catch
 {
 return false;
 }
 }

 public object EA_GetMenuItems(EA.Repository Repository, string
MenuLocation, string MenuName)
 {
 switch (MenuName)
 {
 case "":
 return "- &myAddin";
 case "- &myAddin":
 string() ar = { "&Test" };
 return ar;
 }
 return "";
 }

 public void EA_GetMenuState(EA.Repository Repository, string
MenuLocation, string MenuName, string ItemName, ref bool IsEnabled, ref
bool IsChecked)
 {
 // if no open project, disable all menu options
 if (IsProjectOpen(Repository))
 IsEnabled = true;
 else
 IsEnabled = false;
 }

 public void EA_MenuClick(EA.Repository Repository, string
MenuLocation, string MenuName, string ItemName)
 {
 switch (ItemName)
 {
 case "&Test";
 DoTest(Repository);
 break;
 }
 }

 public void EA_OnInitializeUserRules(EA.Repository Repository)
 {
 if (Repository != null)
 {
 theRules.ConfigureCategories(Repository);
 theRules.ConfigureRules(Repository);
 }
 }

 public void EA_OnRunElementRule(EA.Repository Repository,
string RuleID, EA.Element element)
 {
 theRules.RunElementRule(Repository, RuleID, element);
 }

 public void EA_OnRunDiagramRule(EA.Repository Repository,
string RuleID, long IDiagramID)
 {
 theRules.RunDiagramRule(Repository, RuleID, IDiagramID);
 }

 public void EA_OnRunConnectorRule(EA.Repository Repository,
string RuleID, long IConnectorID)
 {
 theRules.RunConnectorRule(Repository, RuleID,
IConnectorID);
 }
}
```

```

 public void EA_OnRunAttributeRule(EA.Repository Repository,

### 18.3.5.14 Post-New Events

Enterprise Architect Add-Ins can respond to the creation of new elements, connectors, objects, attributes, methods and packages using the following broadcast events:

| Topic   | Detail                                                                                                                                                                                                                                                                                                                                                                                                                  | See Also |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| Details | <p><b>EA_OnPreDeleteMethod</b> notifies Add-Ins that a method (operation) is to be deleted from the model. It enables Add-Ins to permit or deny deletion of the method.</p> <p>This event occurs when a user attempts to permanently delete a method from the <b>Project Browser</b>. The notification is provided immediately before the method is deleted, so that the Add-In can disable deletion of the method.</p> |          |

#### Syntax

**Function** EA\_OnPreDeleteMethod(*Repository As EA.Repository, Info As EA.EventProperties*) **As Boolean**

The *EA\_OnPreDeleteMethod* function syntax contains the following elements:

| Parameter         | Type                                                        | Direction | Description                                                                                                                                                                                                |
|-------------------|-------------------------------------------------------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Info</b>       | <a href="#">EA.EventProperties</a><br><small>[1844]</small> | IN        | Contains the following <i>EventProperty</i> objects for the method to be deleted: <ul style="list-style-type: none"> <li><i>MethodID</i>: A long value corresponding to <i>Method.MethodID</i>.</li> </ul> |
| <b>Repository</b> | <a href="#">EA.Repository</a><br><small>[1855]</small>      | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.                                  |

### Return Value

Return **True** to enable deletion of the method from the model. Return **False** to disable deletion of the method.

#### 18.3.5.15.4 EA\_OnPreDeleteConnector

| Details | <p><i>EA_OnAttributeTagEdit</i> is called when the user clicks the ellipsis ( ... ) button for a Tagged Value of type <i>AddinBroadcast</i> on an attribute</p> <p>The Add-In displays fields to show and change the value and notes; this function provides the initial values for the Tagged Value notes and value, and takes on any changes on exit of the function</p> | <p><a href="#">Predefined Structured Types</a><sup>[1108]</sup></p> <p><a href="#">EA_OnAttributeTagEdit</a><sup>[2031]</sup></p> <p><a href="#">EA_OnConnectorTagEdit</a><sup>[2032]</sup></p> <p><a href="#">EA_OnElementTagEdit</a><sup>[2033]</sup></p> <p><a href="#">EA_OnOperationTagEdit</a><sup>[2034]</sup></p> |

##### Syntax

**Sub EA\_OnAttributeTagEdit(Repository As EA.Repository, ObjectID As Long, String TagName, String TagValue, String TagNotes)**

The *EA\_OnAttributeTagEdit* function syntax contains the following elements:

| Parameter  | Type                                            | Direction | Description                                                                                                                                                                |
|------------|-------------------------------------------------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ObjectID   | Long                                            | IN        | The ID of the object (Attribute) that this Tagged Value is on                                                                                                              |
| Repository | <a href="#">EA.Repository</a> <sup>[1855]</sup> | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model<br>Poll its members to retrieve model data and user interface status information |
| TagName    | String                                          | IN        | The name of the Tagged Value to edit                                                                                                                                       |
| TagNotes   | String                                          | INOUT     | The current value of the Tagged Value notes; if the value is updated, the new value is stored in the repository on exit of the function                                    |

| Parameter | Type   | Direction | Description                                                                                                              |
|-----------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------|
| TagValue  | String | INOUT     | The current value of the tag; if the value is updated, the new value is stored in the repository on exit of the function |

| Topic   | Detail                                                                                                                                                                                                                                                                             | See Also |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| Details | <p><b>EA_OnInitializeTechnologies</b> requests that an Add-In pass an MDG Technology to Enterprise Architect for loading.</p> <p>This event occurs on Enterprise Architect startup. Return your technology XML to this function and Enterprise Architect loads and enables it.</p> |          |

#### Syntax

**Function** EA\_OnInitializeTechnologies(*Repository* As EA.Repository) As Object

The *EA\_OnInitializeTechnologies* function syntax contains the following element:

| Parameter  | Type                                                                                                                        | Direction | Description                                                                                                                                                               |
|------------|-----------------------------------------------------------------------------------------------------------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Repository | <a href="#">EA.Repository</a><br> [1855] | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |

#### Return Value

Return the MDG Technology as a single XML string.

#### Example

```
Public Function EA_OnInitializeTechnologies(ByVal Repository As EA.
Repository) As Object
 EA_OnInitializeTechnologies = My.Resources.MyTechnology
End Function
```

### Syntax

**Sub EA\_OnImportTechnology(Repository As EA.Repository, Info As EA.EventProperties)**

The *EA\_OnImportTechnology* function syntax contains the following elements:

| Parameter  | Type                                                        | Direction | Description                                                                                                                                                               |
|------------|-------------------------------------------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Info       | <a href="#">EA.EventProperties</a><br><small>[1844]</small> | IN        | Contains the following <i>EventProperty</i> objects:<br><br><i>TechnologyID</i> : A string value corresponding to the MDG Technology ID.                                  |
| Repository | <a href="#">EA.Repository</a><br><small>[1855]</small>      | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |

### Return Value

None.

| <b>Abstract</b> | <p>MDG Add-Ins are specialized types of Add-Ins that have additional features and extra requirements for Add-In authors who want to contribute to Enterprise Architect's goal of Model Driven Generation</p> <p>Unlike general Add-In events, MDG Add-In events are only sent to the Add-In that has taken ownership of an Enterprise Architect model branch on a particular PC</p> <p>One of the additional responsibilities of an MDG Add-In is to take ownership of a branch of an Enterprise Architect model, which is done through the <i>MDG_Connect</i> event</p> <p>MDG Add-Ins identify themselves as such during <i>EA_Connect</i> by returning the string <b>MDG</b></p> <p>Unlike ordinary Add-Ins, responding to <i>MDG Add-In</i> events is not optional, and methods must be published for each of the <i>MDG Events</i></p> <p>Two examples of MDG Add-Ins are the commercially available MDG Link for Eclipse and MDG Link for Visual Studio, published by <i>Sparx Systems</i></p> | <a href="#">MDG_Connect</a> <sup>[2044]</sup><br><a href="#">EA_Connect</a> <sup>[1977]</sup><br><a href="#">MDG Events</a> <sup>[2042]</sup><br><a href="#">Sparx Systems</a><br>(Online Resource) |

#### 18.3.8.1 MDG Events

An MDG Add-In must respond to all MDG Events. These events usually identify processes such as Build, Run, Synchronize, PreMerge and PostMerge, amongst others.

An MDG Link Add-In is expected to implement some form of forward and reverse engineering capability within Enterprise Architect, and as such requires access to a specific set of events, all to do with generation,

synchronization and general processes concerned with converting models to code and code to models.

| Details | <p><b>MDG_BuildProject</b> enables the Add-In to handle file changes caused by generation. This function is called in response to a user selecting the <b>Add-Ins   Build Project</b> menu option.</p> <p>Respond to this event by compiling the project source files into a running application.</p> <p>Also look at <b>MDG_RunExe</b>.</p> | <a href="#">MDG_RunExe</a> <sup>[2054]</sup> |

#### Syntax

#### Sub MDG\_BuildProject(Repository As EA.Repository, PackageGuid As String)

The *MDG\_BuildProject* function syntax contains the following elements:

| Parameter   | Type   | Direction | Description                                                |
|-------------|--------|-----------|------------------------------------------------------------|
| PackageGuid | String | IN        | The GUID identifying the Enterprise Architect package sub- |

| Parameter  | Type                                    | Direction | Description                                                                                                                                                               |
|------------|-----------------------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            |                                         |           | tree that is controlled by the Add-In.                                                                                                                                    |
| Repository | <a href="#">EA.Repository</a><br>[1855] | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |

#### Return Value

None.

#### 18.3.8.1.2 MDGConnect

|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------|
| Details | <p><b>MDG_Connect</b> enables the Add-In to handle user driven request to connect a model branch to an external application. This function is called when the user attempts to connect a particular Enterprise Architect package to an as yet unspecified external project. This event enables the Add-In to interact with the user to specify such a project.</p> <p>The Add-In is responsible for retaining the connection details, which should be stored on a per-user or per-workstation basis. That is, users who share a common Enterprise Architect model over a network should be able to connect and disconnect to external projects independently of one another.</p> <p>The Add-In should therefore not store connection details in an Enterprise Architect repository. A suitable place to store such details would be:</p> <pre>SHGet Folder Path( . . CSI_DL_APPDATA. . ) \ Addi nName.</pre> <p>The <i>PackageGuid</i> parameter is the same identifier as required for most events relating to the MDG Add-In. Therefore it is recommended that the connection details be indexed using the PackageGuid value.</p> <p>The <i>PackageID</i> parameter is provided to aid fast retrieval of package details from Enterprise Architect, should this be required.</p> <p>Also look at <b>MDG_Disconnect</b>.</p> | <p><a href="#">MDG_Disconnect</a><br/>[2045]</p> |

#### Syntax

**Function** MDG\_Connect(*Repository As EA.Repository, PackageID as Long, PackageGuid As String*) *As Long*

The *MDG\_Connect* function syntax contains the following elements:

| Parameter   | Type                                                   | Direction | Description                                                                                                                                                               |
|-------------|--------------------------------------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PackageGuid | String                                                 | IN        | The unique ID identifying the project provided by the Add-In when a connection to a project branch of an Enterprise Architect model was first established.                |
| PackageID   | Long                                                   | IN        | The <i>PackageID</i> of the Enterprise Architect package the user has requested to have connected to an external project.                                                 |
| Repository  | <a href="#">EA.Repository</a><br><small>[1855]</small> | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |

### Return Value

Returns a non-zero to indicate that a connection has been made; a zero indicates that the user has not nominated a project and connection should not proceed.

| <b>Details</b> | <p><b>MDG_Merge</b> enables the Add-In to jointly handle changes to both the model branch and the code project that the model branch is connected to. This event should be called whenever the user has asked to merge their model branch with its connected code project, or whenever the user has established a new connection to a code project. The purpose of this event is to enable the Add-In to interact with the user to perform a merge between the model branch and the connected project.</p> | <p><a href="#">MDG_Connect</a> [2044]</p> <p><a href="#">MDG_PreMerge</a><br/>[2052]</p> <p><a href="#">MDG_PostMerge</a><br/>[2051]</p> |

### Syntax

**Function** *MDG\_Merge(Repository As EA.Repository, PackageGuid As String, SynchObjects As Variant, SynchType As String, ExportObjects As Variant, ExportFiles As Variant, ImportFiles As Variant, IgnoreLocked As String, Language As String) As Long*

The *MDG\_Merge* function syntax contains the following elements:

| Parameter            | Type                                    | Direction | Description                                                                                                                                                                                                                                                                                                              |
|----------------------|-----------------------------------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ExportFiles</b>   | <i>Variant</i>                          | OUT       | A string array containing the list of files for each model object chosen for export by the Add-In. Each entry in this array must have a corresponding entry in the <i>ExportObjects</i> parameter at the same array index, so <i>ExportFiles(2)</i> must contain the filename of the object by <i>ExportObjects(2)</i> . |
| <b>ExportObjects</b> | <i>Variant</i>                          | OUT       | The string array containing the list of new model objects (in <i>Object ID</i> format) to be exported by Enterprise Architect to the code project.                                                                                                                                                                       |
| <b>IgnoreLocked</b>  | <i>String</i>                           | OUT       | A value indicating whether to ignore any files locked by the code project (that is, "TRUE" or "FALSE").                                                                                                                                                                                                                  |
| <b>ImportFiles</b>   | <i>Variant</i>                          | OUT       | A string array containing the list of code files made available to the code project to be newly imported to the model. Enterprise Architect imports each file listed in this array for import into the connected model branch.                                                                                           |
| <b>Language</b>      | <i>String</i>                           | OUT       | The string value containing the name of the code language supported by the code project connected to the model branch.                                                                                                                                                                                                   |
| <b>PackageGuid</b>   | <i>String</i>                           | IN        | The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.                                                                                                                                                                                                                         |
| <b>Repository</b>    | <a href="#">EA.Repository</a><br>[1855] | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.                                                                                                                                                |
| <b>SynchObjects</b>  | <i>Variant</i>                          | OUT       | A string array containing a list of objects ( <i>Object ID</i> format) to be jointly synchronized between the model branch and the project. See <a href="#">below</a> [2049] for the format of the Object IDs.                                                                                                           |
| <b>SynchType</b>     | <i>String</i>                           | OUT       | The value determining the user-selected type of synchronization to take place. See <a href="#">below</a> [2048] for a list of valid values.                                                                                                                                                                              |

### Return Value

Return a non-zero if the merge operation completed successfully and a zero value when the operation has been unsuccessful.

### Merge

A merge consists of three major operations:

- **Export:** Where newly created model objects are exported into code and made available to the code project.
- **Import:** Where newly created code objects, Classes and such things are imported into the model.
- **Synchronize:** Where objects available both to the model and in code are jointly updated to reflect changes made in either the model, code project or both

### Synchronize Type

The *Synchronize* operation can take place in one of four different ways. Each of these ways corresponds to a value returned by *SynchType*:

- None: (*SynchType* = 0) No synchronization is to be performed
- Forward: (*SynchType* = 1) Forward synchronization, between the model branch and the code project is

- to occur
- Reverse: (*SynchType* = 2) Reverse synchronization, between the code project and the model branch is to occur
  - Both: (*SynchType* = 3) Reverse, then Forward synchronization's are to occur

### Object ID Format

Each of the Object IDs listed in the string arrays described above should be composed in the following format:

```
(@namespace) * (#class) * ($attribute | %operation | : property) *
```

| Details | <p><b>MDG_NewClass</b> enables the Add-In to alter details of a Class before it is created.</p> <p>This method is called when Enterprise Architect generates a new Class, and requires information relating to assigning the language and file path. The file path should be passed back as a return value and the language should be passed back via the language parameter.</p> | <a href="#">MDG_PreGenerate</a><br>[2057] |

### Syntax

**Function** *MDG\_NewClass(Repository As EA.Repository, PackageGuid As String, CodeID As String, Language As String) As String*

The *MDG\_NewClass* function syntax contains the following elements:

| Parameter          | Type                                    | Direction | Description                                                                                                                                                               |
|--------------------|-----------------------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CodeID</b>      | <i>String</i>                           | IN        | A string used to identify the code element before it is created, for more information see <a href="#">MDG_View</a> [2057].                                                |
| <b>Language</b>    | <i>String</i>                           | OUT       | A string used to identify the programming language for the new Class. The language must be supported by Enterprise Architect.                                             |
| <b>PackageGuid</b> | <i>String</i>                           | IN        | The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.                                                                          |
| <b>Repository</b>  | <a href="#">EA.Repository</a><br>[1855] | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |

### Return Value

Returns a string containing the file path that should be assigned to the Class.

### 18.3.8.1.8 MDGPostGenerate

|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Details | <p><b>MDG_PostGenerate</b> enables the Add-In to handle file changes caused by generation.</p> <p>This event is called after Enterprise Architect has prepared text to replace the existing contents of a file. Responding to this event enables the Add-In to write to the linked application's user interface rather than modify the file directly.</p> <p>When the contents of a file are changed, Enterprise Architect passes <i>FileContents</i> as a non-empty string. New files created as a result of code generation are also sent through this mechanism, enabling Add-Ins to add new files to the linked project's file list.</p> <p>When new files are created Enterprise Architect passes <i>FileContents</i> as an empty string. When a non-zero is returned by this function, the Add-In has successfully written the contents of the file. A zero value for the return indicates to Enterprise Architect that the file must be saved.</p> | <a href="#">MDG_PreGenerate</a><br><small>[2051]</small> |

#### Syntax

**Function** `MDG_PostGenerate(Repository As EA.Repository, PackageGuid As String, FilePath As String, FileContents As String) As Long`

The `MDG_PostGenerate` function syntax contains the following elements:

| Parameter           | Type                                                   | Direction | Description                                                                                                                                                               |
|---------------------|--------------------------------------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>FileContents</b> | <i>String</i>                                          | IN        | A string containing the proposed contents of the file.                                                                                                                    |
| <b>FilePath</b>     | <i>String</i>                                          | IN        | The path of the file Enterprise Architect intends to overwrite.                                                                                                           |
| <b>PackageGuid</b>  | <i>String</i>                                          | IN        | The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.                                                                          |
| <b>Repository</b>   | <a href="#">EA.Repository</a><br><small>[1855]</small> | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |

#### Return Value

Return value depends on the type of event that this function is responding to (see **Details**, above). This function is required to handle two separate and distinct cases.

| Details | <p>MDG_PostMerge is called after a merge process has been completed.</p> <p>This function is called by Enterprise Architect after the merge process has been completed.</p> <p>File save checking should not be performed with this function, but should be handled by <b>MDG_PreGenerate</b>, <b>MDG_PostGenerate</b> and <b>MDG_PreReverse</b>.</p> | <p><a href="#">MDG_PreGenerate</a><br/>[2051]</p> <p><a href="#">MDG_PostGenerate</a><br/>[2050]</p> <p><a href="#">MDG_PreReverse</a><br/>[2053]</p> <p><a href="#">MDG_PreMerge</a><br/>[2052]</p> <p><a href="#">MDG_Merge</a> [2047]</p> |

#### Syntax

*Function MDG\_PostMerge(Repository As EA.Repository, PackageGuid As String) As Long*

The *MDG\_PostMerge* function syntax contains the following elements:

| Parameter   | Type                                    | Direction | Description                                                                                                                                                               |
|-------------|-----------------------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Repository  | <a href="#">EA.Repository</a><br>[1855] | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |
| PackageGuid | <i>String</i>                           | IN        | The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.                                                                          |

#### Return Value

Return a zero value if the post-merge process has failed, a non-zero return indicates that the post-merge has been successful. Enterprise Architect assumes a non-zero return if this method is not implemented

### 18.3.8.1.10 MDGPreGenerate

| Topic   | Detail                                                                                                                                                                                                                                                                              | See Also                                           |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| Details | <p><b>MDG_PreGenerate</b> enables the Add-In to deal with unsaved changes. This function is called immediately before Enterprise Architect attempts to generate files from the model. A possible use of this function would be to prompt the user to save unsaved source files.</p> | <p><a href="#">MDG_PostGenerate</a><br/>[2050]</p> |

#### Syntax

**Function MDG\_PreGenerate(Repository As EA.Repository, PackageGuid As String) As Long**

The *MDG\_PreGenerate* function syntax contains the following elements:

| Parameter   | Type                                                   | Direction | Description                                                                                                                                                               |
|-------------|--------------------------------------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Repository  | <a href="#">EA.Repository</a><br><small>[1855]</small> | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |
| PackageGuid | String                                                 | IN        | The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.                                                                          |

**Return Value**

Return a zero value to abort generation. Any other value enables the generation to continue.

| Details | <p><b>MDG_PreMerge</b> is called after a merge process has been initiated by the user and before Enterprise Architect performs the merge process.</p> <p>This event is called after a user has performed their interactions with the merge screen and has confirmed the merge with the OK button, but before Enterprise Architect performs the merge process using the data provided by the <i>MDG_Merge</i> call, before any changes have been made to the model or the connected project.</p> <p>This event is made available to provide the Add-In with the opportunity to generally set internal Add-In flags to augment the <i>MDG_PreGenerate</i>, <i>MDG_PostGenerate</i> and <i>MDG_PreReverse</i> events.</p> <p>File save checking should not be performed with this function, but should be handled by <b>MDG_PreGenerate</b>, <b>MDG_PostGenerate</b> and <b>MDG_PreReverse</b>.</p> <p>Also look at <b>MDG_Merge</b> and <b>MDG_PostMerge</b>.</p> | <p><a href="#">MDG_PreGenerate</a><br/><small>[2051]</small></p> <p><a href="#">MDG_PostGenerate</a><br/><small>[2050]</small></p> <p><a href="#">MDG_PreReverse</a><br/><small>[2053]</small></p> <p><a href="#">MDG_Merge</a><br/><small>[2047]</small></p> <p><a href="#">MDG_PostMerge</a><br/><small>[2051]</small></p> |

**Syntax****Function MDG\_PreMerge(Repository As EA.Repository, PackageGuid As String) As Long**

The *MDG\_PreMerge* function syntax contains the following elements:

| Parameter  | Type                                                   | Direction | Description                                                                                                                                                               |
|------------|--------------------------------------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Repository | <a href="#">EA.Repository</a><br><small>[1855]</small> | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information. |

| Parameter          | Type          | Direction | Description                                                                                      |
|--------------------|---------------|-----------|--------------------------------------------------------------------------------------------------|
| <b>PackageGuid</b> | <i>String</i> | IN        | The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In. |

### Return Value

A return value of zero indicates that the merge process can not occur. If the value is not zero the merge process proceeds. If this method is not implemented then it is assumed that a merge process is used.

### 18.3.8.1.12 MDGPreReverse

#### Return Value

None.

### 18.3.8.1.14 MDGView

#### Topics:

| Topic   | Detail                                                                                                                                                                                                                                                                      | See Also |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| Details | <b>MDG_View</b> enables the Add-In to display user specified code elements. This function is called by Enterprise Architect when the user asks to view a particular code element. This enables the Add-In to present that element in its own way, usually in a code editor. |          |

#### Syntax

**Function MDG\_View(Repository As EA.Repository, PackageGuid As String, CodeID as String) As Long**

The *MDG\_View* function syntax contains the following elements:

| Parameter          | Type                 | Direction | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|----------------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Repository</b>  | <i>EA.Repository</i> | IN        | An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.                                                                                                                                                                                                                                                                             |
| <b>PackageGuid</b> | <i>String</i>        | IN        | The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.                                                                                                                                                                                                                                                                                                                                                      |
| <b>CodeID</b>      | <i>String</i>        | IN        | Identifies the code element in the following format:<br><type>ElementPart<type>ElementPart..<br>where each element is preceded with a token identifying its type:<br>@ -namespace<br># - Class<br>\$ - attribute<br>% - operation<br>For example if a user has selected the <i>m_Name</i> attribute of <i>Class1</i> located in <i>namespace Name1</i> , the <i>class ID</i> would be passed through in the following format:<br>@Name1#Class1%m_Name |

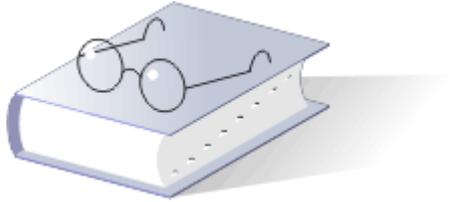

### Return Value

Return a non-zero value to indicate that the Add-In has processed the request. Returning a zero value results in Enterprise Architect employing the standard viewing process which is to launch the associated source file.

## 19.1 A

| Name                       | Detail                                                                                                                                                                                                                                                                            | See also                     |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Abstract Class</b>      | A Class that cannot be directly instantiated.                                                                                                                                                                                                                                     | Concrete Class               |
| <b>Abstraction</b>         | The essential characteristics of an entity that distinguish it from all other kinds of entities. An abstraction defines a boundary relative to the perspective of the viewer.                                                                                                     |                              |
| <b>Action</b>              | The specification of an executable statement that forms an abstraction of a computation procedure. An action typically results in a change in the state of the system, and can be realized by sending a message to an object or modifying a connector or a value of an attribute. |                              |
| <b>Action Sequence</b>     | An expression that resolves to a sequence of actions.                                                                                                                                                                                                                             |                              |
| <b>Action State</b>        | A state that represents the execution of an atomic action, typically the invocation of an operation.                                                                                                                                                                              |                              |
| <b>Activation</b>          | The execution of an action.                                                                                                                                                                                                                                                       |                              |
| <b>Active Class</b>        | A Class whose instances are active objects. When instantiated, an active Class controls its execution. Rather than being invoked or activated by other objects, it can operate standalone, and define its own thread of behavior.                                                 | Active Object                |
| <b>Active Object</b>       | An object that owns a thread and can initiate control activity. An instance of active Class.                                                                                                                                                                                      | Active Class, Thread         |
| <b>Activity</b>            | Defines the bounds for the structural organization that contains a set of basic or fundamental behaviors. It can be used to model procedural type application development for system design through to modeling business processes in organizational structures and work flow.    |                              |
| <b>Activity Diagram</b>    | A diagram used to model procedural type application development for system design through to modeling business processes in organizational structures and work flow.                                                                                                              |                              |
| <b>Activity Graph</b>      | A special case of a State Machine that is used to model processes involving one or more classifiers.                                                                                                                                                                              | State Chart Diagram          |
| <b>Actor ( Class )</b>     | A coherent set of roles that users of Use Cases play when interacting with these Use Cases. An Actor has one role for each Use Case with which it communicates.                                                                                                                   |                              |
| <b>Actual Parameter</b>    | A binding for a parameter that resolves to a run-time instance.                                                                                                                                                                                                                   | Argument, (Formal) Parameter |
| <b>Aggregate ( Class )</b> | A Class that represents the 'whole' in an Aggregation (whole-part) relationship.                                                                                                                                                                                                  | Aggregation                  |
| <b>Aggregation</b>         | A special form of Association that specifies a whole-part relationship between the Aggregate (whole) and a component part.                                                                                                                                                        | Composition                  |
| <b>Analysis</b>            | The part of the software development process whose primary purpose is to formulate a model of the problem domain. Analysis focuses on what to do, design focuses                                                                                                                  | Design                       |

| Name                     | Detail                                                                                                                                                                                                                                                                                                                         | See also                                                 |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|                          | on how to do it.                                                                                                                                                                                                                                                                                                               |                                                          |
| <b>Analysis Diagram</b>  | A diagram used to capture high level business processes and early models of system behavior and elements. It is less formal than some other diagrams, but provides a good means of capturing the essential business characteristics and requirements.                                                                          |                                                          |
| <b>Analysis Time</b>     | Refers to something that occurs during an analysis phase of the software development process.                                                                                                                                                                                                                                  | Modeling Time,<br>Run Time, Compile Time,<br>Design Time |
| <b>Architecture</b>      | The organizational structure and associated behavior of a system. An architecture can be recursively decomposed into parts that interact through interfaces, relationships that connect parts, and constraints for assembling parts. Parts that interact through interfaces include Classes, Components and subsystems.        |                                                          |
| <b>Argument</b>          | A binding for a parameter that resolves to a run-time instance.                                                                                                                                                                                                                                                                | Actual Parameter<br>(Formal) Parameter                   |
| <b>Artifact</b>          | A physical piece of information that is used or produced by a business or development process. Examples of Artifacts include models, source files, scripts, and binary executable files. An Artifact can constitute the implementation of a deployable component.                                                              | Product,<br>Component                                    |
| <b>Assembly</b>          | A connector that bridges the required interface of a component with the provided interface of a second component.                                                                                                                                                                                                              |                                                          |
| <b>Association</b>       | The semantic relationship between two or more classifiers that specifies connections among their instances.                                                                                                                                                                                                                    | Link                                                     |
| <b>Association Class</b> | A model element that has both Association and Class properties. An Association Class can be seen as an Association that also has Class properties, or as a Class that also has Association properties.                                                                                                                         | Class                                                    |
| <b>Association End</b>   | The endpoint of an Association, which connects the Association to a classifier.                                                                                                                                                                                                                                                | Classifier,<br>Link End                                  |
| <b>Attribute</b>         | A feature within a classifier that describes a range of values that instances of the classifier can hold.                                                                                                                                                                                                                      |                                                          |
| <b>Auxiliary Class</b>   | A stereotyped Class that supports another more central or fundamental Class, typically by implementing secondary logic or control flow. Auxiliary Classes are typically used together with focus Classes, and are particularly useful for specifying the secondary business logic or control flow of components during design. | Focus Class                                              |

## 19.2 B

| Name                           | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | See also          |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <b>Behavior</b>                | The observable effects of an operation or event, including its results.                                                                                                                                                                                                                                                                                                                                                                                                                                    |                   |
| <b>Behavioral Diagram</b>      | A diagram that depicts the behavioral features of a system or business process. Behavioral diagrams include Activity diagrams, State Machine diagrams, Communication diagrams, Interaction Overview diagrams, Sequence diagrams, Timing diagrams and Use Case diagrams.                                                                                                                                                                                                                                    |                   |
| <b>Behavioral Feature</b>      | A dynamic feature of a model element, such as an operation or method.                                                                                                                                                                                                                                                                                                                                                                                                                                      |                   |
| <b>Behavioral Model aspect</b> | A model aspect that emphasizes the behavior of the instances in a system, including their methods, collaborations, and state histories.                                                                                                                                                                                                                                                                                                                                                                    |                   |
| <b>Binary Association</b>      | An Association between two Classes. A special case of an N-ary Association.                                                                                                                                                                                                                                                                                                                                                                                                                                | N-ary Association |
| <b>Binding</b>                 | The creation of a model element from a template by supplying arguments for the parameters of the template.                                                                                                                                                                                                                                                                                                                                                                                                 |                   |
| <b>Bookmark</b>                | A marker in a Rich Text Format document that enables you to link inner sections of a document into a master document (using the Word 'Insert File' function).                                                                                                                                                                                                                                                                                                                                              |                   |
| <b>Boolean</b>                 | An enumeration whose values are true and false.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                   |
| <b>Boolean Expression</b>      | An expression that evaluates to a boolean value.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                   |
| <b>Boundary</b>                | <ol style="list-style-type: none"> <li>1. A stereotyped Class that models some system boundary – typically a user interface screen. It is used in the conceptual phase to capture user interaction with the system at a screen level (or some other boundary interface type). It is often used in Sequence and Robustness (Analysis) diagrams. It is the View in the Model-View-Controller pattern.</li> <li>2. A System Boundary element is used to delineate a particular part of the system.</li> </ol> |                   |

## 19.3 C

| Name                         | Detail                                                                                                                                                                                                                                                                                                               | See also                                                                |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|
| <b>C++</b>                   | An object-oriented programming language based on the earlier 'C' language.                                                                                                                                                                                                                                           |                                                                         |
| <b>Call</b>                  | An action state that invokes an operation on a classifier.                                                                                                                                                                                                                                                           |                                                                         |
| <b>Cardinality</b>           | The number of elements in a set.                                                                                                                                                                                                                                                                                     | Multiplicity                                                            |
| <b>CASE</b>                  | Computer Aided Software Engineering. A tool designed for the purpose of modeling and building software systems.                                                                                                                                                                                                      |                                                                         |
| <b>Child</b>                 | In a Generalization relationship, the specialization of another element, the parent.                                                                                                                                                                                                                                 | Subclass,Subtype,Parent                                                 |
| <b>Choice</b>                | A pseudo-state used to compose complex transitional paths, where the outgoing transition path is decided by dynamic, run-time conditions determined by the actions performed by the State Machine on the path leading to the choice.                                                                                 |                                                                         |
| <b>Class</b>                 | A description of a set of objects that share the same attributes, operations, methods, relationships and semantics. A Class can use a set of interfaces to specify collections of operations it provides to its environment.                                                                                         | Interface, Object                                                       |
| <b>Class Diagram</b>         | A diagram that shows a collection of declarative (static) model elements, such as Classes, types, and their contents and relationships.                                                                                                                                                                              | Object Diagram                                                          |
| <b>Classification</b>        | The assignment of an object to a classifier.                                                                                                                                                                                                                                                                         | Dynamic Classification, Multiple Classification, Static Classification. |
| <b>Classifier</b>            | A mechanism that describes behavioral and structural features. Classifiers include Interfaces, Classes, datatypes, and components.                                                                                                                                                                                   |                                                                         |
| <b>Client</b>                | A classifier that requests a service from another classifier.                                                                                                                                                                                                                                                        | Supplier                                                                |
| <b>Collaboration</b>         | The specification of how an operation or classifier, such as a Use Case, is realized by a set of classifiers and Associations playing specific roles used in a specific way. The Collaboration defines an interaction.                                                                                               | Interaction                                                             |
| <b>Collaboration Diagram</b> | Used pre-UML 2.0. Now called a Communication diagram.                                                                                                                                                                                                                                                                |                                                                         |
| <b>Collaboration Use</b>     | Uses an occurrence to apply a pattern defined by a Collaboration to a specific situation.                                                                                                                                                                                                                            |                                                                         |
| <b>Combined Fragment</b>     | A combined fragment reflects a piece or pieces of interaction (called interaction operands) controlled by an interaction operator, whose corresponding boolean conditions are known as interaction constraints. It appears graphically as a transparent window, divided by horizontal dashed lines for each operand. |                                                                         |
| <b>Comment</b>               | An annotation attached to an element or a collection of                                                                                                                                                                                                                                                              | Constraint                                                              |

| Name                               | Detail                                                                                                                                                                                                                                                                                                                                             | See also                                            |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|
|                                    | elements. A comment, or note, has no semantics.                                                                                                                                                                                                                                                                                                    |                                                     |
| <b>Communication Diagram</b>       | A diagram that shows the interactions between elements at run-time in much the same manner as a Sequence diagram. However, Communication diagrams are used to visualize inter-object relationships, while Sequence diagrams are more effective at visualizing processing over time.                                                                | Collaboration Diagram, Object Diagram               |
| <b>Compile Time</b>                | Refers to something that occurs during the compilation of a software module.                                                                                                                                                                                                                                                                       | Modeling Time, Run Time, Analysis Time, Design Time |
| <b>Component</b>                   | A modular, deployable, and replaceable part of a system that encapsulates implementation and exposes a set of interfaces. A Component is typically specified by one or more classifiers (such as implementation Classes) that reside on it, and can be implemented by one or more artifacts (such as binary, executable, or script files).         | Module Artifact, Product                            |
| <b>Component Diagram</b>           | A diagram that shows the organizations and dependencies among Components.                                                                                                                                                                                                                                                                          |                                                     |
| <b>Composite ( Class )</b>         | A Class that is related to one or more Classes by a Composition relationship.                                                                                                                                                                                                                                                                      | Composition                                         |
| <b>Composite State</b>             | A State that consists of either concurrent (orthogonal) substates or sequential (disjoint) substates.                                                                                                                                                                                                                                              | Substate, Concurrent Substate, Disjoint Substate    |
| <b>Composite Structure Diagram</b> | A diagram that reflects the internal collaboration of Classes, Interfaces, or Components to describe a functionality. Composite Structure diagrams are similar to Class diagrams, except that they model a specific usage of the structure.                                                                                                        |                                                     |
| <b>Composition</b>                 | A form of Aggregation that requires that a part instance be included in at most one Composite at a time, and that the Composite object is responsible for the creation and destruction of the parts. Composition can be recursive.                                                                                                                 | Composite Aggregation                               |
| <b>Concrete Class</b>              | A Class that can be directly instantiated.                                                                                                                                                                                                                                                                                                         | Abstract Class                                      |
| <b>Concurrency</b>                 | The occurrence of two or more activities during the same time interval. Concurrency can be achieved by interleaving or simultaneously executing two or more threads.                                                                                                                                                                               | Thread                                              |
| <b>Concurrent Substate</b>         | A substate that can be held simultaneously with other substates contained in the same composite State.                                                                                                                                                                                                                                             | Composite State<br>Disjoint Substate                |
| <b>Connector</b>                   | A logical link between model elements. Can be structural, dynamic or possessive.                                                                                                                                                                                                                                                                   |                                                     |
| <b>Constraint</b>                  | <ol style="list-style-type: none"> <li>1. A semantic condition or restriction. Certain constraints are predefined in the UML, others can be user defined. Constraints are one of three extensibility mechanisms in UML.</li> <li>2. A rule or condition that applies to some element. It is often modeled as a pre- or post- condition.</li> </ol> | Tagged Value, Stereotype<br>Comment                 |

| Name                         | Detail                                                                                                                                                                                                                    | See also |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| <b>Container</b>             | 1. An instance that exists to contain other instances, and that provides operations to access or iterate over its contents.(for example, arrays, lists, sets).<br>2. A component that exists to contain other components. |          |
| <b>Containment Hierarchy</b> | A namespace hierarchy consisting of model elements, and the containment relationships that exist between them. A containment hierarchy forms a graph.                                                                     |          |
| <b>Context</b>               | A view of a set of related modeling elements for a particular purpose, such as specifying an operation.                                                                                                                   |          |
| <b>Continuation</b>          | A Continuation is used in seq and alt combined fragments, to indicate the branches of continuation an operand follows.                                                                                                    |          |
| <b>Control</b>               | A stereotyped Class that represents a controlling entity or manager. A Control organizes and schedules other activities and elements. It is the controller of the Model-View-Controller pattern.                          |          |
| <b>Control Flow</b>          | A connector linking two nodes in an activity diagram. Control Flow connectors start a node's activity when the preceding node's action is finished.                                                                       |          |

## 19.4 D

| Name                            | Detail                                                                                                                                                                                                                                                                                  | See also           |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| <b>Database Schema</b>          | The description of a database structure. It defines tables and fields and the relationship between them.                                                                                                                                                                                |                    |
| <b>Datastore</b>                | An element used to define permanently stored data. A token of data that is stored in the Datastore is stored permanently. A token of data that comes out of the Datastore is a copy of the original data. The tokens imported are kept for the life of the Activity in which it exists. |                    |
| <b>Datatype</b>                 | A descriptor of a set of values that lack identity and whose operations do not have side effects. Datatypes include primitive pre-defined types and user-definable types. Pre-defined types include numbers, string and time. User-definable types include enumerations.                |                    |
| <b>Decision</b>                 | An element of an Activity diagram that indicates a point of conditional progression: if a condition is true, then processing continues one way, if not, then another.                                                                                                                   |                    |
| <b>Defining Model (MOF)</b>     | The model on which a repository is based. Any number of repositories can have the same defining model.                                                                                                                                                                                  |                    |
| <b>Delegate</b>                 | A connector that defines the internal assembly of a component's external ports and interfaces. Using a Delegate connector wires the internal workings of the system to the outside world, by a delegation of the external interfaces' connections.                                      |                    |
| <b>Delegation</b>               | The ability of an object to issue a message to another object in response to a message. Delegation can be used as an alternative to inheritance.<br><br>Contrast: inheritance                                                                                                           |                    |
| <b>Dependency</b>               | A relationship between two modeling elements, in which a change to one modeling element (the independent element) affects the other modeling element (the dependent element).                                                                                                           |                    |
| <b>Deployment</b>               | A type of Dependency relationship that indicates the deployment of an artifact onto a node or executable target.                                                                                                                                                                        |                    |
| <b>Deployment Diagram</b>       | A diagram that shows the configuration of run-time processing nodes and the components, processes, and objects that live on them. Components represent run-time manifestations of code units.                                                                                           | Component Diagrams |
| <b>Deployment Specification</b> | Specifies parameters guiding deployment of an artifact, as is common with most hardware and software technologies.                                                                                                                                                                      |                    |
| <b>Derived Element</b>          | A model element that can be computed from another element, but that is shown for clarity or that is included for design purposes even though it adds no semantic information.                                                                                                           |                    |
| <b>Design</b>                   | The part of the software development process whose primary purpose is to decide how the system is to be                                                                                                                                                                                 | Analysis           |

| Name                          | Detail                                                                                                                                                                                                                                                                                                                         | See also                                             |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
|                               | implemented. During design, strategic and tactical decisions are made to meet the required functional and quality requirements of a system.                                                                                                                                                                                    |                                                      |
| <b>Design Time</b>            | Refers to something that occurs during a design phase of the software development process.                                                                                                                                                                                                                                     | Modeling Time, Run Time, Compile Time, Analysis Time |
| <b>Development Process</b>    | A set of partially ordered steps performed for a given purpose during software development, such as constructing models or implementing models.                                                                                                                                                                                |                                                      |
| <b>Diagram</b>                | A graphical presentation of a collection of model elements, most often rendered as a connected graph of arcs (relationships) and vertices (other model elements). UML supports 14 diagram types, and Enterprise Architect extends these with seven more. Add-Ins, technologies and profiles can provide further diagram types. |                                                      |
| <b>Diagram Gate</b>           | A simple graphical way to indicate the point at which messages can be transmitted into and out of Interaction Fragments.                                                                                                                                                                                                       |                                                      |
| <b>Diagram View</b>           | The Enterprise Architect workspace area where the UML diagrams are displayed.                                                                                                                                                                                                                                                  |                                                      |
| <b>Disjoint Substate</b>      | A substate that cannot be held simultaneously with other substates contained in the same composite State.                                                                                                                                                                                                                      | Composite State, Substate, Concurrent Substate       |
| <b>Distribution Unit</b>      | A set of objects or components that are allocated to a process or a processor as a group. A distribution unit can be represented by a run-time composite or an Aggregate.                                                                                                                                                      |                                                      |
| <b>Domain</b>                 | An area of knowledge or activity characterized by a set of concepts and terminology understood by practitioners in that area.                                                                                                                                                                                                  |                                                      |
| <b>Dynamic Classification</b> | A semantic variation of Generalization in which an object can change its classifier.                                                                                                                                                                                                                                           | Multiple Classification, Static Classification       |

## 19.5 E

| Name                     | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | See also            |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| <b>Element</b>           | <ol style="list-style-type: none"> <li>1. An atomic constituent of a model.</li> <li>2. A model object of any type, such as Class, Component, Node or Object.</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                           |                     |
| <b>Endpoint</b>          | Used in Interaction diagrams to reflect a lost message in sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                     |
| <b>Entity</b>            | A store or persistence mechanism that captures the information or knowledge in a system. It is the Model in the Model-View-Controller pattern.                                                                                                                                                                                                                                                                                                                                                                                                                     |                     |
| <b>Entry Action</b>      | An action executed upon entering a state in a State Machine regardless of the transition taken to reach that state.                                                                                                                                                                                                                                                                                                                                                                                                                                                |                     |
| <b>Entry Point</b>       | Used to define where external states can enter a Sub Machine.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                     |
| <b>Enumeration</b>       | A list of named values used as the range of a particular attribute type. For example, RGBColor = {red, green, blue}. Boolean is a predefined enumeration with values from the set {false, true}.                                                                                                                                                                                                                                                                                                                                                                   |                     |
| <b>Event</b>             | The specification of a significant occurrence that has a location in time and space. In the context of State diagrams, an event is an occurrence that can trigger a transition.                                                                                                                                                                                                                                                                                                                                                                                    |                     |
| <b>Exception Handler</b> | An element that defines the group of operations to carry out when an exception occurs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                     |
| <b>Exit Action</b>       | An action executed upon exiting a State in a State Machine regardless of the transition taken to exit that State.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                     |
| <b>Exit Point</b>        | Used in Sub Machine states and State Machines to denote the point where the machine is exited and the transition sourcing this exit point, for Sub Machines, is triggered. Exit points are a type of pseudo-state used in the State Machine diagram.                                                                                                                                                                                                                                                                                                               |                     |
| <b>Export</b>            | In the context of packages, to make an element visible outside its enclosing namespace.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Visibility , Import |
| <b>Expose Interface</b>  | A toolbox icon that is a graphical way to depict the required and supplied interfaces of a Component, Class or Part.                                                                                                                                                                                                                                                                                                                                                                                                                                               |                     |
| <b>Expression</b>        | A string that evaluates to a value of a particular type. For example, the expression $(7 + 5 * 3)$ evaluates to a value of type number. A relationship from an extension Use Case to a base Use Case, specifying how the behavior defined for the extension Use Case augments (subject to conditions specified in the extension) the behavior defined for the base Use Case. The behavior is inserted at the location defined by the extension point in the base Use Case. The base Use Case does not depend on performing the behavior of the extension Use Case. | Extend , Include    |

| Name                       | Detail                                                                                                                                                                                                                                                                                                           | See also        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Facade</b>              | A stereotyped package containing only references to model elements owned by another package. It is used to provide a 'public view' of some of the contents of a package.                                                                                                                                         |                 |
| <b>Feature</b>             | A property, like operation or attribute, that is encapsulated within a classifier, such as an Interface, a Class, or a Datatype.                                                                                                                                                                                 |                 |
| <b>Final</b>               | A pseudo-state that indicates an end.                                                                                                                                                                                                                                                                            |                 |
| <b>Final State</b>         | A special kind of State signifying that the enclosing composite State or the entire State Machine is completed.                                                                                                                                                                                                  |                 |
| <b>Fire</b>                | To execute a State transition.                                                                                                                                                                                                                                                                                   | Transition      |
| <b>Flow Final</b>          | An element that depicts an exit from the system, as opposed to the Activity Final, which represents the completion of the activity.                                                                                                                                                                              |                 |
| <b>Focus Class</b>         | A stereotyped Class that defines the core logic or control flow for one or more auxiliary Classes that support it. Focus Classes are typically used together with one or more auxiliary Classes, and are particularly useful for specifying the core business logic or control flow of components during design. | Auxiliary Class |
| <b>Focus of Control</b>    | A symbol on a Sequence diagram that shows the period of time during which an object is performing an action, either directly or through a subordinate procedure.                                                                                                                                                 |                 |
| <b>Forward Engineering</b> | The process of generating source code from the UML model.                                                                                                                                                                                                                                                        |                 |
| <b>Fork</b>                | Used in State Machine diagrams as pseudo-states. With respect to State Machine diagrams, a Fork pseudo-state signifies that its incoming transition comes from a single State, and it has multiple outgoing transitions.                                                                                         | Join            |
| <b>Framework</b>           | A stereotyped package containing model elements that specify a reusable architecture for all or part of a system. Frameworks typically include Classes, Patterns or templates. When frameworks are specialized for an application domain, they are sometimes referred to as Application frameworks.              | Pattern         |

## 19.7 G

| Name                         | Detail                                                                                                                                                                                                                                                                                                | See also                           |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|
| <b>Generalizable Element</b> | A model element that can participate in a Generalization relationship.                                                                                                                                                                                                                                | Generalization                     |
| <b>Generalization</b>        | A taxonomic relationship between a more general element and a more specific element. The more specific element is fully consistent with the more general element and contains additional information. An instance of the more specific element can be used where the more general element is allowed. | Generalizable Element, Inheritance |
| <b>Guard Condition</b>       | A condition that must be satisfied in order to enable an associated transition to fire.                                                                                                                                                                                                               |                                    |

**19.8 H**

| Name                 | Detail                                                                                                                                                                                                                                                                                                                | See also |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| <b>History State</b> | There are two types of History pseudo-states defined in UML: shallow History and deep History. A shallow History sub-state is used to represent the most recently active sub-state of a composite State. A deep History sub-state, in contrast, reflects the most recent active configuration of the composite State. |          |

## 19.9 I

| Name                                | Detail                                                                                                                                                                                                                                                                                                                                                                                        | See also                   |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <b>Implementation</b>               | A definition of how something is constructed or computed. For example, a Class is an implementation of a type, a method is an implementation of an operation.                                                                                                                                                                                                                                 |                            |
| <b>Implementation Class</b>         | A stereotyped Class that specifies the implementation of a Class in some programming language (for example, C++, Smalltalk, Java) in which an instance can not have more than one Class. An Implementation Class is said to realize a type if it provides all of the operations defined for the type with the same behavior as specified for the type's operations.                           | Type                       |
| <b>Implementation Inheritance</b>   | The inheritance of the implementation of a more general element. Includes inheritance of the interface.                                                                                                                                                                                                                                                                                       | Interface Inheritance      |
| <b>Import</b>                       | In the context of packages, a dependency that shows the packages whose Classes can be referenced within a given package (including packages recursively embedded within it).                                                                                                                                                                                                                  | Visibility , Export        |
| <b>Include</b>                      | A relationship from a base Use Case to an inclusion Use Case, specifying how the behavior for the base Use Case contains the behavior of the inclusion Use Case. The behavior is included at the location that is defined in the base Use Case. The base Use Case depends on performing the behavior of the inclusion Use Case, but not on its structure (that is, attributes or operations). | Extend, Expression         |
| <b>Inheritance</b>                  | The mechanism by which more specific elements incorporate the structure and behavior of more general elements related by behavior.                                                                                                                                                                                                                                                            | Generalization, Delegation |
| <b>Initial State</b>                | A pseudo-state used to denote the default state of a composite State; there can be one initial vertex in each region of the composite State.                                                                                                                                                                                                                                                  |                            |
| <b>Instance</b>                     | An entity that has a unique identity, a set of operations that can be applied to it, and a state that stores the effects of the operations.                                                                                                                                                                                                                                                   | Object                     |
| <b>Interaction</b>                  | A specification of how stimuli are sent between instances to perform a specific task. The interaction is defined in the context of a collaboration.                                                                                                                                                                                                                                           | Collaboration              |
| <b>Interaction Diagram</b>          | A generic term that applies to several types of diagrams that emphasize object interactions. These include Timing diagrams, Sequence diagrams, Interaction Overview diagrams and Communication diagrams.                                                                                                                                                                                      |                            |
| <b>Interaction Occurrence</b>       | A reference to an existing interaction element. Interaction occurrences are visually represented by a frame, with ref in the frame's title space. The diagram name is indicated in the frame contents.                                                                                                                                                                                        |                            |
| <b>Interaction Overview Diagram</b> | A diagram that visualizes the cooperation between other Interaction diagrams to illustrate a control flow serving an encompassing purpose. As Interaction Overview diagrams are a variant of Activity diagrams, most of the                                                                                                                                                                   |                            |

| Name                         | Detail                                                                                                                        | See also                   |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------|----------------------------|
|                              | diagram notation is similar, as is the process in constructing the diagram.                                                   |                            |
| <b>Interface</b>             | A named set of operations that characterize the behavior of an element.                                                       | Class , Type               |
| <b>Interface Inheritance</b> | The inheritance of the interface of a more general element. Does not include inheritance of the implementation.               | Implementation Inheritance |
| <b>Internal Transition</b>   | A transition signifying a response to an event without changing the state of an object.                                       |                            |
| <b>Interrupt Flow</b>        | An Enterprise Architect-defined toolbox icon used to define the exception handler and interruptible activity region concepts. |                            |

## 19.10 J

| Name            | Detail                                                                                                                                                                                                            | See also |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| <b>Java</b>     | A fully object-oriented, cross platform language based on elements from Smalltalk, C++ and other OO languages.                                                                                                    |          |
| <b>Join</b>     | Used in State Machine diagrams and in Activity diagrams to synchronize multiple flows.                                                                                                                            | Fork     |
| <b>Junction</b> | Junction pseudo-states are used to design complex transitional paths. A Junction can be used to combine, or merge, multiple paths into a shared transition path or to split an incoming path into multiple paths. |          |

**19.11 L**

| <b>Name</b>       | <b>Detail</b>                                                                                                                                                                                 | <b>See also</b>                |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|
| <b>Layer</b>      | The organization of classifiers or packages at the same level of abstraction. A layer represents a horizontal slice through an architecture, whereas a partition represents a vertical slice. | Partition                      |
| <b>Lifeline</b>   | An individual participant in an interaction (that is, Lifelines cannot have multiplicity). A Lifeline represents a distinct connectable element.                                              |                                |
| <b>Link</b>       | A semantic connector among a tuple of objects. An instance of an Association.                                                                                                                 | Association                    |
| <b>Link End</b>   | An instance of an Association end.                                                                                                                                                            | Association End,<br>Classifier |
| <b>Local Path</b> | A relative path on a local machine, enabling developers to store shared source code in machine specific directories, but still generate and synchronize code.                                 |                                |

## 19.12 M

| Name                              | Detail                                                                                                                                                                                                                                       | See also        |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Maintenance</b>                | The support of a software system after it is deployed.                                                                                                                                                                                       |                 |
| <b>Manifest</b>                   | A relationship that indicates that the artifact source embodies the target model element. Stereotypes can be added to Enterprise Architect to classify the type of manifestation of the model element.                                       |                 |
| <b>Message</b>                    | Messages indicate a flow of information, or transition of control, between elements. Messages are used by Communication diagrams, Sequence diagrams, Interaction Overview diagrams and Timing diagrams.                                      |                 |
| <b>Message Endpoint</b>           | An element that defines an endpoint of a Lifeline, such as a State or Value Lifeline in a Timing diagram.                                                                                                                                    |                 |
| <b>Message Label</b>              | Used for messages sent between Lifelines to make the diagram appear less cluttered. Labels with the same name indicate that a message can be interrupted.                                                                                    |                 |
| <b>Metaclass</b>                  | A Class whose instances are Classes. Metaclasses are typically used to construct metamodels                                                                                                                                                  |                 |
| <b>Metafile</b>                   | A vector-based image format native to Windows. Supports high detail and excellent scaling. Typically used for saving diagram images for placement in documents. Comes in Placeable (an older format) and Enhanced (current standard format). |                 |
| <b>Meta-Metamodel</b>             | A model that defines the language for expressing a metamodel. The relationship between a meta-metamodel and a metamodel is analogous to the relationship between a metamodel and a model.                                                    |                 |
| <b>Metamodel</b>                  | A model that defines the language for expressing a model.                                                                                                                                                                                    |                 |
| <b>Meta-Object</b>                | A generic term for all meta-entities in a meta-modeling language. For example, meta-types, meta-classes, meta-attributes, and meta-associations.                                                                                             |                 |
| <b>Meta-Object Facility (MOF)</b> | An Object Management Group (OMG) standard. MOF originated in the UML, when the OMG required a Meta-Modeling architecture to define the UML. MOF is designed as a four-layered architecture.                                                  |                 |
| <b>Method</b>                     | The implementation of an operation. It specifies the algorithm or procedure associated with an operation.                                                                                                                                    |                 |
| <b>Model ( MOF )</b>              | An abstraction of a physical system with a certain purpose. Usage note: In the context of the MOF specification, which describes a meta-metamodel, the meta-metamodel is for brevity frequently referred to simply as the model.             | Physical System |
| <b>Model Aspect</b>               | A dimension of modeling that emphasizes particular qualities of the metamodel. For example, the structural model aspect emphasizes the structural qualities of the metamodel.                                                                |                 |

| Name                           | Detail                                                                                                                                                                                                                                                                                                                  | See also                                           |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| <b>Model Elaboration</b>       | The process of generating a repository type from a published model. Includes the generation of interfaces and implementations which enables repositories to be instantiated and populated based on, and in compliance with, the model elaborated.                                                                       |                                                    |
| <b>Model Element ( MOF )</b>   | An element that is an abstraction drawn from the system being modeled. In the MOF specification model elements are considered to be meta-objects.                                                                                                                                                                       | View Element;                                      |
| <b>Model Library</b>           | A stereotyped package containing model elements that are intended to be reused by other packages. A model library differs from a profile in that a model library does not extend the metamodel using stereotypes and tagged definitions. A model library is analogous to a Class library in some programming languages. |                                                    |
| <b>Modeling Time</b>           | Refers to something that occurs during the modeling phase of the software development process. It includes analysis time and design time. Usage note: When discussing object systems, it is often important to distinguish between modeling-time and run-time concerns.                                                 | Analysis Time, Design Time, Compile time, Run time |
| <b>Module</b>                  | A software unit of storage and manipulation. Modules include source code modules, binary code modules and executable code modules.                                                                                                                                                                                      | Component                                          |
| <b>MOF</b>                     | Meta-Object Facility, an Object Management Group (OMG) standard. MOF originated in the UML, when the OMG required a Meta-Modeling architecture to define the UML. MOF is designed as a four-layered architecture.                                                                                                       |                                                    |
| <b>Multiple Classification</b> | A semantic variation of Generalization in which an object can belong directly to more than one classifier.                                                                                                                                                                                                              | Static Classification, Dynamic Classification      |
| <b>Multiple Inheritance</b>    | A semantic variation of Generalization in which a type can have more than one supertype.                                                                                                                                                                                                                                | Single Inheritance                                 |
| <b>Multiplicity</b>            | A specification of the range of enableable cardinalities that a set can assume. Multiplicity specifications can be given for roles within Associations, Parts within Composites, repetitions and other purposes. Essentially a multiplicity is a (possibly infinite) subset of the non-negative integers.               | Cardinality                                        |
| <b>Multi-Valued ( MOF )</b>    | A model element with multiplicity defined whose Multiplicity Type:: upper attribute is set to a number greater than one. The term multi-valued does not pertain to the number of values held by, for example, an attribute or parameter, at any point in time.                                                          | Single-Valued                                      |

**19.13 N**

| Name                     | Detail                                                                                                                                                                                                                                                                   | See also           |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| <b>Name</b>              | A string used to identify a model element.                                                                                                                                                                                                                               |                    |
| <b>Namespace</b>         | A part of the model in which the names can be defined and used. Within a namespace, each name has a unique meaning.                                                                                                                                                      | Name               |
| <b>N-ary Association</b> | An Association among three or more Classes. Each instance of the Association is an n-tuple of values from the respective Classes.                                                                                                                                        | Binary Association |
| <b>Nesting</b>           | A connector used as an alternative membership notation to indicate nested members within an element; for example, a package that has nested members. The nested members of a package could also be shown inside the package rather than linked by the Nesting connector. |                    |
| <b>Node</b>              | A classifier that represents a run-time computation resource, which generally has at least a memory and often processing capability. Run-time objects and components can reside on nodes.                                                                                |                    |

## 19.14 O

| Name                                 | Detail                                                                                                                                                                                                                                                  | See also                                                                                           |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <b>Object</b>                        | An entity with a well-defined boundary and identity that encapsulates state and behavior. State is represented by attributes and relationships, behavior is represented by operations, methods and State Machines. An Object is an instance of a Class. | Class, Instance                                                                                    |
| <b>Object Diagram</b>                | A diagram that encompasses objects and their relationships at a point in time. An Object diagram can be considered as a special case of a Class diagram or Communication diagram.                                                                       | Class Diagram, Communication Diagram                                                               |
| <b>Object Flow</b>                   | A sub type of the State flow or transition. It implies the passing of an object instance between elements at run-time.                                                                                                                                  |                                                                                                    |
| <b>Object Flow State</b>             | A state in an Activity graph that represents the passing of an object from the output of actions in one State to the input of actions in another State.                                                                                                 |                                                                                                    |
| <b>Object Lifeline</b>               | A line in a Sequence diagram that represents the existence of an object over a period of time.                                                                                                                                                          | Sequence Diagram                                                                                   |
| <b>Object Management Group (OMG)</b> | The standards body responsible for the UML specification and management.                                                                                                                                                                                | Their website is <a href="http://www.omg.org">www.omg.org</a> - follow the links to the UML pages. |
| <b>Occurrence</b>                    | A relationship that indicates that a Collaboration represents a classifier. An Occurrence connector is drawn from the collaboration to the classifier.                                                                                                  |                                                                                                    |
| <b>Operation</b>                     | A service that can be requested from an object to effect behavior. An operation has a signature, which could restrict the actual parameters that are possible.                                                                                          |                                                                                                    |

## 19.15 P

| Name                   | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | See also                                          |

| <b>Package</b>         | <p>1. A namespace, as well as an element that can be contained in other packages' namespaces. Packages can own or merge with other packages, and their elements can be imported into a package's namespace.</p> <p>2. A logical container of model elements. It groups elements and can also contain other packages.</p> <p>The OMG UML specification (UML Superstructure Specification, v2.1.1, p. 109) states:</p> <p>A package is used to group elements, and provides a namespace for the grouped elements.</p> <p>A package is a namespace for its members, and can contain other packages. Only packageable elements can be owned members of a package. By virtue of being a namespace, a package can import either individual members of other packages, or all the members of other packages.</p> <p>In addition a package can be merged with other packages.</p> <p>Note that packages own model elements and are the basis for configuration control, storage and access control. Each element can be directly owned by a single package, so the package hierarchy is a strict tree. However, packages can reference other packages, modeled by using one of the stereotypes «import» and «access» of Permission dependency, so the usage network is a graph. Other kinds of dependencies between packages usually imply that one or more dependencies among the elements exist.</p> <p>A package is represented by the common folder icon - a large rectangle with a small rectangle (a 'tab') attached to the left side on top.</p> |                                                   |
| <b>Package Diagram</b> | Used to reflect the organization of packages and their elements, and provide a visualization of their corresponding namespaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                   |
| <b>Package Import</b>  | A package import relationship is drawn from a source package to a package whose contents are imported. Private members of a target package cannot be imported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                   |
| <b>Package Merge</b>   | Indicates a relationship between two packages whereby the contents of the target package are merged with those of the source package. Private contents of a target package are not merged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                   |
| <b>Parameter</b>       | The specification of a variable that can be changed, passed, or returned. A parameter can include a name, type, and direction. Parameters are used for operations, messages and events.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Formal Parameter ,<br>Argument , Actual parameter |
| <b>Parameterized</b>   | The descriptor for a Class with one or more unbound                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Template, Parameterized                           |

| Name                     | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                   | See also                 |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| <b>element</b>           | parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                              | class                    |
| <b>Parent</b>            | In a generalization relationship, the generalization of another element, the child.                                                                                                                                                                                                                                                                                                                                                                      | Subclass, Subtype, Child |
| <b>Part</b>              | A run-time instance of a Class or Interface.                                                                                                                                                                                                                                                                                                                                                                                                             |                          |
| <b>Participate</b>       | The connection of a model element to a relationship or to a reified relationship. For example, a Class participates in an Association, an Actor participates in a Use Case.                                                                                                                                                                                                                                                                              |                          |
| <b>Partition</b>         | <ol style="list-style-type: none"> <li>1. activity graphs: A portion of an activity graph that organizes the responsibilities for actions.</li> <li>2. architecture: A set of related classifiers or packages at the same level of abstraction or across layers in a layered architecture. A partition represents a vertical slice through an architecture, whereas a layer represents a horizontal slice.</li> </ol>                                    | Layer , Swim Lane        |
| <b>Pattern</b>           | A template collaboration.                                                                                                                                                                                                                                                                                                                                                                                                                                | Framework                |
| <b>Persistent Object</b> | An object that exists after the process or thread that created it has ceased to exist.                                                                                                                                                                                                                                                                                                                                                                   |                          |
| <b>Physical System</b>   | <ol style="list-style-type: none"> <li>1. The subject of a model.</li> <li>2. A collection of connected physical units, which can include software, hardware and people, that are organized to accomplish a specific purpose. A physical system can be described by one or more models, possibly from different viewpoints.</li> </ol>                                                                                                                   | Model (MOF) , System     |
| <b>Port</b>              | Defines the interaction between a classifier and its environment. Interfaces controlling this interaction can be depicted using the 'Expose Interface' toolbox icon.                                                                                                                                                                                                                                                                                     |                          |
| <b>Postcondition</b>     | A constraint that must be true at the completion of an operation.                                                                                                                                                                                                                                                                                                                                                                                        |                          |
| <b>Precondition</b>      | A constraint that must be true when an operation is invoked.                                                                                                                                                                                                                                                                                                                                                                                             |                          |
| <b>Primitive Type</b>    | A pre-defined basic datatype without any substructure, such as an integer or a string.                                                                                                                                                                                                                                                                                                                                                                   |                          |
| <b>Process</b>           | <ol style="list-style-type: none"> <li>1. A heavyweight unit of concurrency and execution in an operating system. Thread, which includes heavyweight and lightweight processes. If necessary, an implementation distinction can be made using stereotypes.</li> <li>2. A software development process - the steps and guidelines by which to develop a system.</li> <li>3. To execute an algorithm or otherwise handle something dynamically.</li> </ol> | Thread                   |
| <b>Product</b>           | A physical piece of information that is produced by a business or development process. Examples of products include models, source files, scripts, and binary executable files. An product can constitute the                                                                                                                                                                                                                                            | Artifact , Component     |

| Name                         | Detail                                                                                                                                                                                                                                                                                                      | See also     |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
|                              | implementation of a deployable component.                                                                                                                                                                                                                                                                   |              |
| <b>Profile</b>               | A stereotyped package that contains model elements that have been customized for a specific domain or purpose using extension mechanisms, such as stereotypes, tagged definitions and constraints. A profile can also specify model libraries on which it depends and the metamodel subset that it extends. |              |
| <b>Project Browser</b>       | The workspace window where the model contents are displayed in 'tree' format. Displays structures such as packages, diagrams and model elements.                                                                                                                                                            |              |
| <b>Projection</b>            | A mapping from a set to its subset.                                                                                                                                                                                                                                                                         |              |
| <b>Property</b>              | A named value denoting a characteristic of an element. A property has semantic impact. Certain properties are predefined in the UML; others can be user defined.                                                                                                                                            | Tagged Value |
| <b>Pseudo-State</b>          | A vertex in a State Machine that has the form of a State, but doesn't behave as a State. Pseudo-states include initial and history vertices.                                                                                                                                                                |              |
| <b>Published Model (MOF)</b> | A model that has been frozen, and that becomes available for instantiating repositories and for support in defining other models. A frozen model's model elements cannot be changed.                                                                                                                        |              |

**19.16 Q**

| Name      | Detail                                                                                                                                | See also |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------|----------|
| Qualifier | An Association attribute or tuple of attributes whose values partition the set of objects related to an object across an Association. |          |

## 19.17 R

| Name                         | Detail                                                                                                                                                                                                                                                                                                                                                                                                                 | See also         |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Realize</b>               | A source object realizes the destination object. Realize is used to express traceability and completeness in the model – a business process or requirement is realized by one or more Use Cases which are in turn realized by some Classes which in turn are realized by a Component, and so on.                                                                                                                       |                  |
| <b>Receive ( A message )</b> | The handling of a stimulus passed from a sender instance.                                                                                                                                                                                                                                                                                                                                                              | Sender, Receiver |
| <b>Receive</b>               | An element used to define the acceptance or receipt of a request. Movement on to the next action occurs until it has received what is defined.                                                                                                                                                                                                                                                                         |                  |
| <b>Receiver ( Object )</b>   | The object handling a stimulus passed from a sender object.                                                                                                                                                                                                                                                                                                                                                            | Sender           |
| <b>Reception</b>             | A declaration that a classifier is prepared to react to the receipt of a signal.                                                                                                                                                                                                                                                                                                                                       |                  |
| <b>Recursion</b>             | A type of message used in Sequence diagrams to indicate a recursive function.                                                                                                                                                                                                                                                                                                                                          |                  |
| <b>Reference</b>             | 1. A denotation of a model element.<br>2. A named slot within a classifier that facilitates navigation to other classifiers.                                                                                                                                                                                                                                                                                           | Pointer          |
| <b>Region</b>                | UML 2.x supports both Expansion Regions and Interruptible Activity Regions. An Expansion Region defines the bounds of a region consisting of one or more sets of input collections, where an input collection is a set of elements of the same type. An Interruptible Activity Region contains Activity nodes - when a token leaves an interruptible region, this terminates all of the region's tokens and behaviors. |                  |
| <b>Refinement</b>            | A relationship that represents a fuller specification of something that has already been specified at a certain level of detail. For example, a design Class is a refinement of an analysis Class.                                                                                                                                                                                                                     |                  |
| <b>Relationship</b>          | A semantic connection among model elements. Examples of relationships include Associations and Generalizations.                                                                                                                                                                                                                                                                                                        |                  |
| <b>Repository</b>            | A facility for storing object models, interfaces and implementations.                                                                                                                                                                                                                                                                                                                                                  |                  |
| <b>Represents</b>            | A connector that indicates a Collaboration Use is used in a classifier. The connector is drawn from the Collaboration Use to its owning classifier.                                                                                                                                                                                                                                                                    |                  |
| <b>Requirement</b>           | A required feature, property or behavior of a system (external requirement).                                                                                                                                                                                                                                                                                                                                           |                  |
| <b>Responsibility</b>        | A contract or obligation of a classifier (internal requirement).                                                                                                                                                                                                                                                                                                                                                       |                  |

| Name                       | Detail                                                                                                                                                                                                                                                                                                                                                                                   | See also                                                                                                                                 |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reuse</b>               | The use of a pre-existing artifact.                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                          |
| <b>Reverse Engineering</b> | The process of importing source code into the model as standard UML model objects (such as Classes, attributes and operations).                                                                                                                                                                                                                                                          |                                                                                                                                          |
| <b>Rich Text Format</b>    | A standard mark-up language for creating word processor documents, frequently associated with Microsoft Word.                                                                                                                                                                                                                                                                            |                                                                                                                                          |
| <b>Robustness Diagram</b>  | Enterprise Architect supports business process modeling extensions from the UML business process model profile. Robustness diagrams are used in ICONIX.                                                                                                                                                                                                                                  | You can read more about this at <a href="http://www.sparxsystems.com/iconix/iconixsw.htm">www.sparxsystems.com/iconix/iconixsw.htm</a> . |
| <b>Role</b>                | <ol style="list-style-type: none"> <li>1. The named detail and rules associated with one end of an association. Can indicate name, constraints, multiplicity and collection details.</li> <li>2. The named specific behavior of an entity participating in a particular context. A role can be static (such as an Association end) or dynamic (such as a Collaboration role).</li> </ol> |                                                                                                                                          |
| <b>Role Binding</b>        | The mapping between a Collaboration Use's internal roles and the respective parts required to implement a specific situation. The associated parts can have properties defined to enable the binding to occur, and the collaboration to take place.                                                                                                                                      |                                                                                                                                          |
| <b>Run Time</b>            | The period of time during which a computer program executes.                                                                                                                                                                                                                                                                                                                             | Analysis Time, Compile Time, Design Time, Modeling Time                                                                                  |

## 19.18 S

| Name                            | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | See also                               |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------|
| <b>Scenario</b>                 | <ol style="list-style-type: none"> <li>1. A specific sequence of actions that illustrates behaviors. A scenario can be used to illustrate an interaction or the execution of a Use Case instance.</li> <li>2. A sequence of operations carried out in some order to produce a known result. Can apply to Use Cases where it is the equivalent of a Sequence diagram, or to other objects to describe how they are used at run-time.</li> </ol>                                                                                                                             | Interaction                            |
| <b>Schema ( MOF )</b>           | In the context of the MOF, analogous to a package that is a container of model elements. Schema corresponds to a MOF package.                                                                                                                                                                                                                                                                                                                                                                                                                                              | Metamodel, Package                     |
| <b>Self-Message</b>             | Reflects a new process or method invoked within the calling Lifeline's operation. It is a specification of a message.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                        |
| <b>Semantic Variation Point</b> | A point of variation in the semantics of a metamodel. It provides an intentional degree of freedom for the interpretation of the metamodel semantics.                                                                                                                                                                                                                                                                                                                                                                                                                      |                                        |
| <b>Send ( A message )</b>       | The passing of a stimulus from a sender instance to a receiver instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Sender, Receiver                       |
| <b>Sender ( Object )</b>        | The object passing a stimulus to a receiver object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Receiver                               |
| <b>Sequence Diagram</b>         | A diagram that shows object interactions arranged in time sequence. In particular, it shows the objects participating in the interaction and the sequence of messages exchanged. Unlike a Communication (Collaboration) diagram, a Sequence diagram includes time sequences but does not include object relationships. A Sequence diagram can exist in a generic form (describes all possible scenarios) and in an instance form (describes one actual scenario). Sequence diagrams and Communication diagrams express similar information, but show it in different ways. | Communication Diagram, Object Lifeline |
| <b>Signal</b>                   | The specification of an asynchronous stimulus communicated between instances. Signals can have parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                        |
| <b>Signature</b>                | The name and parameters of a behavioral feature. A signature can include an optional returned parameter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                        |
| <b>Single Inheritance</b>       | A semantic variation of Generalization in which a type can have only one supertype.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Multiple Inheritance                   |
| <b>Single Valued ( MOF )</b>    | A model element with multiplicity defined is single valued when its Multiplicity Type: upper attribute is set to 1. The term single-valued does not pertain to the number of values held by, for example, an attribute or parameter at any point in time, since a single-valued attribute (for instance, with a multiplicity lower bound of zero) could have no value.                                                                                                                                                                                                     | Multi-Valued                           |
| <b>Specification</b>            | A declarative description of what something is or does.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Implementation                         |

| Name                         | Detail                                                                                                                                                                                                                                                                                                                                                                                               | See also                                         |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------|
| <b>State</b>                 | A condition or situation during the life of an object during which it satisfies some condition, performs some activity, or waits for some event.                                                                                                                                                                                                                                                     | State ( OMA )                                    |
| <b>State Invariant</b>       | A condition applied to a Lifeline that must be fulfilled for the Lifeline to exist.                                                                                                                                                                                                                                                                                                                  |                                                  |
| <b>State Machine</b>         | A behavior that specifies the sequences of States that an object or an interaction goes through during its life in response to events, together with its responses and actions.                                                                                                                                                                                                                      |                                                  |
| <b>State Machine Diagram</b> | A diagram that illustrates how an element, often a Class, can move between States classifying its behavior, according to transition triggers, constraining guards and other aspects of State Machine diagrams that depict and explain movement and behavior.                                                                                                                                         |                                                  |
| <b>State Chart</b>           | A diagram that shows a State Machine.                                                                                                                                                                                                                                                                                                                                                                | State Machine , Activity Graph                   |
| <b>State Continuation</b>    | A symbol that serves two different purposes for Interaction diagrams - as State Invariants and as Continuations. A State Invariant is a condition applied to a Lifeline that must be fulfilled for the Lifeline to exist. A Continuation is used in seq and alt combined fragments to indicate the branches of continuation that an operand follows.                                                 |                                                  |
| <b>State Lifeline</b>        | A State Lifeline follows discrete transitions between States, which are defined along the y-axis of the timeline. Any transition has optional attributes of timing constraints, duration constraints and observations.                                                                                                                                                                               |                                                  |
| <b>Static Classification</b> | A semantic variation of Generalization in which an object can not change classifier.                                                                                                                                                                                                                                                                                                                 | Multiple Classification , Dynamic Classification |
| <b>Stereotype</b>            | A new type of modeling element that extends the semantics of the metamodel. Stereotypes must be based on certain existing types or Classes in the metamodel. Stereotypes can extend the semantics, but not the structure of pre-existing types and Classes. Certain stereotypes are predefined in the UML, others can be user defined. Stereotypes are one of three extensibility mechanisms in UML. | Constraint , Tagged value                        |
| <b>Stimulus</b>              | The passing of information from one instance to another, such as raising a signal or invoking an operation. The receipt of a signal is normally considered an event.                                                                                                                                                                                                                                 | Message                                          |
| <b>String</b>                | A sequence of text characters. The details of string representation depend on implementation, and can include character sets that support international characters and graphics.                                                                                                                                                                                                                     |                                                  |
| <b>Structural Diagram</b>    | A diagram that depicts the structural elements composing a system or function. These diagrams can reflect the static relationships of a structure, as do Class or Package diagrams, or run-time architectures, such as Object or Composite Structure diagrams. Structural diagrams include Class diagrams, Composite Structure diagrams,                                                             |                                                  |

| Name                           | Detail                                                                                                                                                                                                                                                | See also                                                  |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
|                                | Component diagrams, Deployment diagrams, Object diagrams and Package diagrams.                                                                                                                                                                        |                                                           |
| <b>Structural Feature</b>      | A static feature of a model element, such as an attribute.                                                                                                                                                                                            |                                                           |
| <b>Structural Model Aspect</b> | A model aspect that emphasizes the structure of the objects in a system, including their types, Classes, relationships, attributes and operations.                                                                                                    |                                                           |
| <b>Subactivity State</b>       | A State in an activity graph that represents the execution of a non-atomic sequence of steps that has some duration.                                                                                                                                  |                                                           |
| <b>Subclass</b>                | In a Generalization relationship, the specialization of another Class; the superclass.                                                                                                                                                                | Generalization, Child , Parent Superclass                 |
| <b>Submachine State</b>        | A State in a State Machine that is equivalent to a composite State but its contents are described by another State Machine.                                                                                                                           |                                                           |
| <b>Subpackage</b>              | A package that is contained in another package.                                                                                                                                                                                                       |                                                           |
| <b>Substate</b>                | A State that is part of a composite State.                                                                                                                                                                                                            | Composite State , Concurrent Substate , Disjoint Substate |
| <b>Subsystem</b>               | A grouping of model elements that represents a behavioral unit in a physical system. A subsystem offers interfaces and has operations. In addition, the model elements of a subsystem can be partitioned into specification and realization elements. | Package, Physical System                                  |
| <b>Subtype</b>                 | In a Generalization relationship, the specialization of another type; the supertype.                                                                                                                                                                  | Generalization , Child , Parent Supertype                 |
| <b>Superclass</b>              | In a Generalization relationship, the generalization of another Class; the subclass.                                                                                                                                                                  | Generalization Subclass                                   |
| <b>Supertype</b>               | In a Generalization relationship, the generalization of another type; the subtype.                                                                                                                                                                    | Generalization Subtype                                    |
| <b>Supplier</b>                | A classifier that provides services that can be invoked by others.                                                                                                                                                                                    | Client                                                    |
| <b>Swimlane</b>                | A partition on an Activity diagram for organizing the responsibilities for actions. Swimlanes typically correspond to organizational units in a business model.                                                                                       | Partition                                                 |
| <b>Synch</b>                   | A State used for indicating that concurrent paths of a State Machine are synchronized. After bringing the paths to a synch state, the emerging transition indicates unison.                                                                           |                                                           |
| <b>Synchronize Code</b>        | The process of importing and exporting code changes to ensure the model and source code match.                                                                                                                                                        |                                                           |
| <b>System</b>                  | A top-level subsystem in a model.                                                                                                                                                                                                                     | Physical System                                           |
| <b>System Boundary</b>         | An element used to delineate a particular part of the system.                                                                                                                                                                                         |                                                           |

## 19.19 T

| Name                         | Detail                                                                                                                                                                                                                                                                            | See also                                   |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|
| <b>Table</b>                 | A relational table (composed of columns).                                                                                                                                                                                                                                         |                                            |
| <b>Tagged Value</b>          | The explicit definition of a property as a name-value pair. In a Tagged Value, the name is referred to as the tag. Certain tags are predefined in the UML; others can be user defined. Tagged Values are one of three extensibility mechanisms in UML.                            | Constraint, Property, Stereotype           |
| <b>Template</b>              | The descriptor for a Class with one or more unbound parameters.                                                                                                                                                                                                                   | Parameterized Element, Parameterized Class |
| <b>Terminate</b>             | A pseudostate indicating that upon entry of its pseudostate, the State Machine's execution ends.                                                                                                                                                                                  |                                            |
| <b>Thread ( of Control )</b> | A single path of execution through a program, a dynamic model, or some other representation of control flow. Also, a stereotype for the implementation of an active object as a lightweight process.                                                                              | Active Object, Process, Concurrency        |
| <b>Time Event</b>            | An event that denotes the time elapsed since the current state was entered.                                                                                                                                                                                                       | Event                                      |
| <b>Time Expression</b>       | An expression that resolves to an absolute or relative value of time.                                                                                                                                                                                                             |                                            |
| <b>Timing Diagram</b>        | A diagram that defines the behavior of different objects within a time-scale, with visual depictions of those objects changing state and interacting over time.                                                                                                                   |                                            |
| <b>Toolbox</b>               | The main toolbar running down the center of Enterprise Architect, from which you can select model elements to insert into diagrams. This is also known as the Toolbox and the Object toolbar.                                                                                     |                                            |
| <b>Top Level</b>             | A stereotype of package denoting the top-most package in a containment hierarchy. The topLevel stereotype defines the outer limit for looking up names, as namespaces 'see' outwards. For example, opTopLevelsubsystem represents the top of the subsystem containment hierarchy. |                                            |
| <b>Trace</b>                 | A dependency that indicates a historical or process relationship between two elements that represent the same concept without specific rules for deriving one from the other.                                                                                                     |                                            |
| <b>Transient Object</b>      | An object that exists only during the execution of the process or thread that created it.                                                                                                                                                                                         |                                            |
| <b>Transition</b>            | A relationship between two States indicating that an object in the first State performs certain specified actions and enters the second State when a specified event occurs and specified conditions are satisfied. On such a change of State, the transition is said to fire.    | Fire, Object Flow                          |
| <b>Type</b>                  | A stereotyped Class that specifies a domain of objects together with the operations applicable to the objects, without defining the physical implementation of those                                                                                                              | Implementation Class, Interface            |

---

| Name                   | Detail                                                                                                                                                                                                                                                     | See also |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|                        | objects. A type can not contain any methods, maintain its own thread of control, or be nested. However, it can have attributes and associations. Although an object can have at most one implementation Class, it can conform to multiple different types. |          |
| <b>Type Expression</b> | An expression that evaluates to a reference to one or more types.                                                                                                                                                                                          |          |

## 19.20 U

| Name                       | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | See also          |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <b>UML</b>                 | The Unified Modeling Language, a notation and specification for modeling software systems in an Object-Oriented manner. You can read more about UML at the OMG home page or at our UML Tutorial.                                                                                                                                                                                                                                                                                  |                   |
| <b>UML Diagrams</b>        | Diagrams used to model different aspects of the system under development. They include various elements and connectors, all of which have their own meanings and purposes. UML 2.3 includes 14 diagrams: Use Case diagram, Activity diagram, State Machine diagram, Timing diagram, Sequence diagram, Interaction Overview diagram, Communication diagram, Package diagram, Class diagram, Object diagram, Composite Structure diagram, Component diagram and Deployment diagram. |                   |
| <b>UML Toolbox</b>         | The main toolbar running down the center of Enterprise Architect from which you can select model elements to insert into diagrams. This is also known as the Toolbox and the Object toolbar.                                                                                                                                                                                                                                                                                      |                   |
| <b>Uninterpreted</b>       | A placeholder for a type or types whose implementation is not specified by the UML. Every uninterpreted value has a corresponding string representation.                                                                                                                                                                                                                                                                                                                          | Any ( CORBA )     |
| <b>Usage</b>               | A dependency in which one element (the client) requires the presence of another element (the supplier) for its correct functioning or implementation.                                                                                                                                                                                                                                                                                                                             |                   |
| <b>Use</b>                 | A connector that indicates that one element requires another to perform some interaction. The Usage relationship does not specify how the target supplier is used, other than that the source client uses it in definition or implementation.                                                                                                                                                                                                                                     |                   |
| <b>Use Case ( Class )</b>  | A UML model element that describes how a user of the proposed system interacts with the system to perform a discrete unit of work. It describes and signifies a single interaction over time that has meaning for the end user (person, machine or other system), and is required to leave the system in a complete state: either the interaction completed or was rolled back to the initial state.                                                                              | Use Case Instance |
| <b>Use Case Diagram</b>    | A diagram that captures Use Cases and Actor interactions. It describes the functional requirements of the system, the manner in which outside things (Actors) interact at the system boundary, and the response of the system.                                                                                                                                                                                                                                                    |                   |
| <b>Use Case Estimation</b> | The technique of estimating project size and complexity based on the number of Use Cases and their difficulty.                                                                                                                                                                                                                                                                                                                                                                    |                   |
| <b>Use Case Instance</b>   | The performance of a sequence of actions being specified in a Use Case. An instance of a Use Case.                                                                                                                                                                                                                                                                                                                                                                                | Use Case Class    |
| <b>Use Case Model</b>      | A model that describes a system's functional requirements in terms of Use Cases.                                                                                                                                                                                                                                                                                                                                                                                                  |                   |
| <b>Utility</b>             | A stereotype that groups global variables and procedures                                                                                                                                                                                                                                                                                                                                                                                                                          |                   |

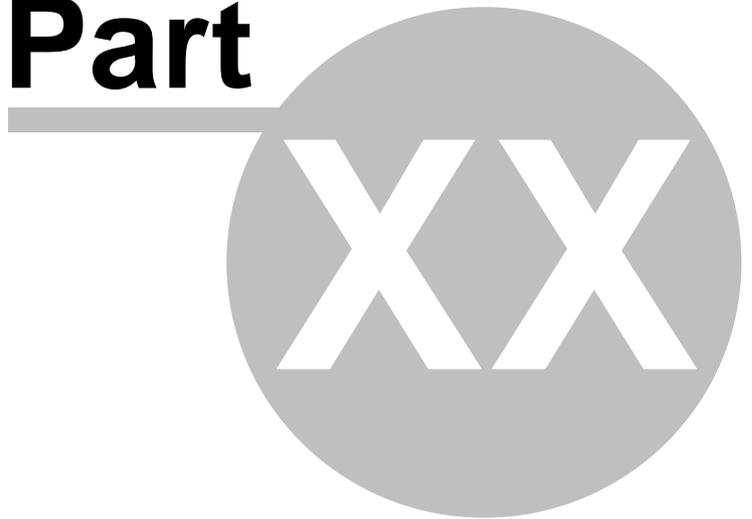

---

| Name | Detail                                                                                                                                                                                                                   | See also |

|      | in the form of a Class declaration. The utility attributes and operations become global variables and global procedures, respectively. A utility is not a fundamental modeling construct, but a programming convenience. |          |

## 19.21 V

| Name                   | Detail                                                                                                                                                                               | See also            |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| <b>Value</b>           | An element of a type domain.                                                                                                                                                         |                     |
| <b>Value Lifeline</b>  | A Lifeline that shows the Lifeline's state across the diagram, within parallel lines indicating a steady state. A cross between the lines indicates a transition or change in state. |                     |
| <b>Vertex</b>          | A source or a target for a transition in a State Machine. A vertex can be either a State or a pseudo-state.                                                                          | State, Pseudo-State |
| <b>View</b>            | A projection of a model, which is seen from a given perspective or vantage point and omits entities that are not relevant to this perspective.                                       |                     |
| <b>View Element</b>    | An element that is a textual and/or graphical projection of a collection of model elements.                                                                                          | Model Element (MOF) |
| <b>View Projection</b> | A projection of model elements onto view elements. A view projection provides a location and a style for each view element.                                                          |                     |
| <b>Visibility</b>      | An enumeration whose value (public, protected, package or private) denotes how the model element to which it refers can be seen outside its enclosing namespace                      | Export, Import      |
| <b>Visual Basic</b>    | A rapid application development programming language. Windows' only scripting language based on COM.                                                                                 |                     |

## 20 License Management

The License Management dialog in Enterprise Architect enables you to upgrade Enterprise Architect and to register Add-Ins. The dialog lists:

- The currently-registered keys
- The product each key applies to
- When each private key expires
- When each shared key is to be reactivated in the keystore for issue to another user

**Access:** [Help | Register and Manage License Key\(s\)](#)

### Reference:

The options on the License Management dialog are explained in the following table:

| Option                                  | Action                                                                                                                                                                                                                                                                                                                                                                           | See also                                                                                                                                                                                                                           |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Add Key</b>                          | Display the Add Registration Key dialog, which enables you to: <ul style="list-style-type: none"> <li>• Register your new Enterprise Architect license</li> <li>• Obtain a shared key from the Sparx Systems Key Store (available for version 4.51 and above)</li> <li>• Add a new key to update to a higher version of Enterprise Architect or to register an Add-In</li> </ul> | <a href="#">Register a Full License</a> <sup>[209]</sup><br><a href="#">Add License Key</a> <sup>[209b]</sup><br><a href="#">Upgrade an Existing License</a> <sup>[209a]</sup><br><a href="#">Register Add-In</a> <sup>[210]</sup> |

### How to:

To add a private key, follow the steps below:

| Step | Action                                                                             | See also                                           |
|------|------------------------------------------------------------------------------------|----------------------------------------------------|
| 1    | Click on the Enter Private Key tab                                                 | <a href="#">License Management</a> <sup>2094</sup> |
| 2    | In the <b>Name</b> and <b>Company</b> fields, type your user name and company name |                                                    |

| Step | Action                                                                                                                              | See also |
|------|-------------------------------------------------------------------------------------------------------------------------------------|----------|
| 3    | In the <b>Copy registration key into space below...</b> field, copy the registration key (including any parentheses around the key) |          |
| 4    | Click on the <b>OK</b> button to confirm the key selection                                                                          |          |

To add a shared key, follow the steps below:

| Step | Action                                                                                                                                                                                                                                               | See also                                     |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| 1    | Click on the Get Shared Key tab                                                                                                                                                                                                                      | <a href="#">License Management</a><br>[2097] |
| 2    | In the <b>Name</b> and <b>Company</b> fields, type your user name and company name                                                                                                                                                                   |                                              |
| 3    | In the <b>Shared Keystore</b> field, click on the ( ... ) (Browse) button<br>The Shared Keystore Selection dialog displays                                                                                                                           |                                              |
| 4    | If your keystore is file-based: <ul style="list-style-type: none"> <li>• Select the <b>File Based Keystore</b> radio button</li> <li>• Click on the <b>Browse</b> button, and</li> <li>• Locate and select the keystore file</li> </ul> Go to step 7 |                                              |
| 5    | If the keystore is network-based: <ul style="list-style-type: none"> <li>• Click on the <b>Sparx Keystore Server</b> radio button</li> <li>• In the <b>Server Address</b> field, type the server address of the keystore</li> </ul>                  |                                              |
| 6    | If necessary, type in the password (advised by your administrator) and/or click on the <b>Test</b> button to ensure that you have a connection to the keystore                                                                                       |                                              |
| 7    | Click on the <b>OK</b> button to return to the Get Shared Key tab<br>This now shows the name of the keystore in the <b>Shared Keystore</b> field                                                                                                     |                                              |
| 8    | In the <b>Select a Product</b> field, click on the appropriate product name                                                                                                                                                                          |                                              |
| 9    | Click on the <b>OK</b> button<br>The License Management dialog redisplay, indicating that the shared key is registered for the selected product until the key expiry date                                                                            |                                              |
| 10   | Click on the <b>Close</b> button                                                                                                                                                                                                                     |                                              |

| <p><i>Error reading Key Store file:<br/>(Access is denied)</i></p>        | <p>All users who are to use the shared key facility require <b>Read, Write and Modify</b> access to the <i>sskeys.dat</i> file containing the shared keys</p> <p>Please verify that all required users have sufficient permissions to the file and try again</p> <p>Review the effective permissions calculated at the location of the key file for the user account reporting the problem - you should closely examine the permissions for both the Network Share and the File System; it is possible that these permissions have been overwritten at some point</p> <p>If the problem continues, contact Sparx Support</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <p><i>Error reading Key Store file:<br/>(Key File has been moved)</i></p> | <p>In the key store, as a security measure the hard drive serial number is recorded when the file is created; the file then cannot be moved from the original location in which it was created</p> <p>If the key store has to be re-located for any reason, the administrator should re-create the key store in the new location using the original license keys</p> <p>This issue is commonly seen after a file server has undergone a hardware upgrade in which the physical hard drives have been replaced; problems could also occur if the drive used is part of a RAID configuration</p> <p>The message can also appear where the key store exists on a Novell-based file system - when creating the key store, the administrator is prompted to confirm that the key store is to be located on a Novell Netware file server; if they click on the <b>Yes</b> button, the key store instead records the logical path used to create it, and all users must connect to the key store using this same path</p> <p>The recorded path is case-sensitive and must be an exact match</p> |

## 20.4 Upgrade an Existing License

This topic explains how to upgrade your installation of Enterprise Architect to a more powerful edition.

| Topic                          | Detail                                                                                                                                                                                                                                                                                                                                                                                                                    | See also                                                                                                                                                                    |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Editions</b>                | <p>There are six Enterprise Architect editions:</p> <ul style="list-style-type: none"> <li>• Desktop</li> <li>• Professional</li> <li>• Corporate</li> <li>• Business and Software Engineering</li> <li>• Systems Engineering</li> <li>• Ultimate</li> </ul> <p>The installation file provides the facilities of all editions; your registration key gives access to the facilities of the edition you have purchased</p> | <a href="#">Editions Available</a> <sup>[14]</sup>                                                                                                                          |
| <b>Upgrade</b>                 | <p>If you have purchased a less powerful edition, such as Professional or Desktop, you can subsequently upgrade your existing license to a more powerful edition by purchasing a special upgrade key from Sparx Systems</p> <p>Once you have purchased and received the appropriate key, use the procedure below to gain access to the additional features</p>                                                            | <a href="#">Enterprise Architect Purchase Details</a>                                                                                                                       |
| <b>Trial and Lite Editions</b> | <p>The Lite edition and the Trial version cannot be registered or upgraded</p> <p>If you have used either of these versions and then purchased Enterprise Architect, you must download the registered version from:</p> <p style="text-align: center;"><i>www.sparxsystems.com/securedownloads/easetupfull.exe</i></p> <p>Then you can enter your registration key</p>                                                    | <a href="#">The Trial Version</a> <sup>[13]</sup><br><a href="#">The Read-only 'Lite' Edition</a> <sup>[18]</sup><br><a href="#">Registered User software download site</a> |
| <b>Application</b>             | <p>This topic is mainly applicable to users with private keys</p> <p>If you are an end-user with a shared key, you would simply be allocated the relevant key next time you requested one</p> <p>If, however, you want to upgrade while using a shared key on a long lease, you would simply click on the <b>Release Key</b> button and then the <b>Add Key</b> button</p>                                                | <a href="#">Adding License Keys</a> <sup>[2096]</sup>                                                                                                                       |

**Access:** [Help | Register and Manage License Key\(s\)](#) > **License Management: Add Key**

### How to:

To upgrade from one license edition to another, follow the steps below:

| Step | Action                                                                                                                    | See also                                             |
|------|---------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
| 1    | Make sure you have a valid upgrade key purchased from Sparx Systems; you typically receive this in an email or PDF format |                                                      |
| 2    | On the Add Registration Key dialog, in the <b>Name</b> and <b>Company</b> fields, type your name and company name         | <a href="#">License Management</a> <sup>[2094]</sup> |

| Step | Action                                                                                                                                                                                                                                                                                                                                  | See also |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 3    | Copy the key you received for the upgraded edition of Enterprise Architect - including the { and } bracket characters - from the email                                                                                                                                                                                                  |          |
| 4    | Paste the key into the <b>Copy registration key</b> field                                                                                                                                                                                                                                                                               |          |
| 5    | Click on the <b>OK</b> button<br>Enterprise Architect displays the message:<br><i>Registration succeeded – Thank you for purchasing Enterprise Architect<br/>xxxx Edition</i>                                                                                                                                                           |          |
| 6    | Click on the <b>OK</b> button, and then on the <b>Close</b> button to continue working in Enterprise Architect                                                                                                                                                                                                                          |          |
| 7    | Select the <b>Help   About EA</b> menu option<br>Copy the registration key shown and store it somewhere safe; this is a key to the full license of the edition you have upgraded to<br>If you ever have to reinstall Enterprise Architect, you can register it with this key, so you won't have to go through the upgrade process again |          |

## 20.5 Register Add-In

Apart from registering Enterprise Architect, you must also register any Add-Ins you purchase to use with the application

This topic explains how to register a private key; if you have purchased a floating licence (shared key) for the Add-In, follow the *Add a Shared Key* section of the *Adding License Keys* topic.

**Access:** [Help | Register and Manage License Key\(s\) Add-Ins | Enter License Key for <Add-In name>](#)

### How To:

To register Add-Ins for Enterprise Architect, follow the steps below:

| Step | Action                                                                                                                                                                                                                                                                 | See Also                                                  |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
| 1    | Purchase one or more licenses for the Add-In from your Add-In provider<br>Once you have paid for a licensed version of the Add-In, you receive (via email or other suitable means) a license key for the product                                                       |                                                           |
| 2    | Save the license key and the latest full version of the Add-In                                                                                                                                                                                                         |                                                           |
| 3    | Run the Add-In's setup program to install the Add-In                                                                                                                                                                                                                   |                                                           |
| 4    | In Enterprise Architect, select either of the menu options: <ul style="list-style-type: none"> <li>• <b>Register and Manage License Key(s)</b></li> <li>• <b>Add-Ins   Enter License Key for &lt;Add-In name&gt;</b></li> </ul> The License Management dialog displays | <a href="#">License Management</a><br>t <sup>[2094]</sup> |
| 5    | Click on the <b>Add Key</b> button<br>The Add Registration Key dialog displays, showing the Enter Private Key tab                                                                                                                                                      |                                                           |
| 6    | Type or copy-and-paste in the key you received with the Add-In, including the { and } characters                                                                                                                                                                       |                                                           |
| 7    | Click on the <b>OK</b> button                                                                                                                                                                                                                                          |                                                           |
| 8    | When the Add-In has been added successfully, close down Enterprise Architect and restart it to apply the integration changes imposed by the Add-In                                                                                                                     |                                                           |
