6.10.1.2.1.7 Add Code Modules

When creating an MDG Technology file, you can include code modules.

To use the code modules section of the MDG Technology Types Wizard, follow the steps below:

Step	Description	See Also																				
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the Code Modules checkbox. The MDG Technology Wizard - Code Modules dialog displays.	Creating MDG Technologies, Step 6 [1065]																				
2	Click on the checkboxes (Product , Data Types , and Code Templates) for each of the required Code Modules. The code modules listed are those defined in your current project. These could be the Enterprise Architect default languages, or those you have defined yourself using code templates and the Code Template Editor. Before you can set up a code template for the new language in the editor, you must define at least one data type for the language. Once the MDG Technology file is created it can be loaded into your current model and into other models.	Code Templates Overview [1482] Code Template Editor [1485] Data Types [777]																				
3	To select any code options for a module, click on the (...) button in the Code Options column for that module. This enables you to select an XML document that provides additional settings for the language that are not covered by the data types or code templates. The root node of the XML document should be <code>CodeOptions</code> . The child nodes should be called <code>CodeOption</code> and should contain a <code>name</code> attribute. The supported code options are as follows:	Field Substitution Macros [1116]																				
	<table border="1"> <thead> <tr> <th>Code Option</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>ConstructorName</td> <td>The name of a function used as a constructor for the <code>classHasConstructor</code> code template macro.</td> </tr> <tr> <td>CopyConstructorName</td> <td>The name of a function used as a copy constructor for the <code>classHasCopyConstructor</code> code template macro.</td> </tr> <tr> <td>DefaultExtension</td> <td>The default extension when generating code.</td> </tr> <tr> <td>DefaultSourceDirectory</td> <td>The default path to which Enterprise Architect generates code.</td> </tr> <tr> <td>DestructorName</td> <td>The name of a function used as a destructor for the <code>classHasDestructor</code> code template macro.</td> </tr> <tr> <td>Editor</td> <td>The external editor used for editing source code.</td> </tr> <tr> <td>ImplementationExtension</td> <td>The extension used by Enterprise Architect for the implementation file.</td> </tr> <tr> <td>ImplementationPath</td> <td>The relative path from the source file to the implementation file.</td> </tr> <tr> <td>PackagePathSeparator</td> <td>The delimiter used to separate package names in the <code>packagePath</code> macro from the code template macro.</td> </tr> </tbody> </table>	Code Option	Description	ConstructorName	The name of a function used as a constructor for the <code>classHasConstructor</code> code template macro.	CopyConstructorName	The name of a function used as a copy constructor for the <code>classHasCopyConstructor</code> code template macro.	DefaultExtension	The default extension when generating code.	DefaultSourceDirectory	The default path to which Enterprise Architect generates code.	DestructorName	The name of a function used as a destructor for the <code>classHasDestructor</code> code template macro.	Editor	The external editor used for editing source code.	ImplementationExtension	The extension used by Enterprise Architect for the implementation file.	ImplementationPath	The relative path from the source file to the implementation file.	PackagePathSeparator	The delimiter used to separate package names in the <code>packagePath</code> macro from the code template macro.	
Code Option	Description																					
ConstructorName	The name of a function used as a constructor for the <code>classHasConstructor</code> code template macro.																					
CopyConstructorName	The name of a function used as a copy constructor for the <code>classHasCopyConstructor</code> code template macro.																					
DefaultExtension	The default extension when generating code.																					
DefaultSourceDirectory	The default path to which Enterprise Architect generates code.																					
DestructorName	The name of a function used as a destructor for the <code>classHasDestructor</code> code template macro.																					
Editor	The external editor used for editing source code.																					
ImplementationExtension	The extension used by Enterprise Architect for the implementation file.																					
ImplementationPath	The relative path from the source file to the implementation file.																					
PackagePathSeparator	The delimiter used to separate package names in the <code>packagePath</code> macro from the code template macro.																					
	<p>An example of a valid code options file is shown below.</p> <pre><CodeOptions> <CodeOption name="DefaultExtension"> ext </CodeOption></pre>

6.10.1.2.1.8 Add MDA Transforms

When creating an MDG Technology file, you can include the MDA Transformations that have been modified in the model.

To use the Transform Modules section of the MDG Technology Wizard, follow the steps below:

Step	Description	See Also
1	<p>Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the MDA Transforms checkbox. The MDG Technology Wizard - Transform Modules dialog displays.</p>	Creating MDG Technologies, Step 6 ^[1065]
2	<p>Click the checkbox against the template name of each required template that is present in the current model.</p>	
3	<p>Click on the Next button to proceed.</p>	

6.10.1.2.1.9 Add Images

When creating an MDG Technology file, you incorporate images to be used in all models in which the technology is *deployed*. These images must already be available in the model in which the technology is being *developed*; you can import the images into this model using the **Add New** button on the **Image Manager**.

To use the Image Selection section of the MDG Technology Wizard, follow the steps below

Step	Description	See Also
1	<p>Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the Images checkbox. The MDG Technology Wizard - Image Selection dialog displays.</p>	Creating MDG Technologies, Step 6 ^[1065]
2	<p>For each required model image available in the current model, select the checkbox next to the image name. A preview of each image displays on the right of the dialog as you select the checkbox.</p>	
3	<p>Click on the Next button to proceed.</p>	

Learn More:

- [Image Manager](#)^[593]

6.10.1.2.1.10 Add Scripts

When creating an MDG Technology file, you can include scripts that you have created in the model.

To use the Script Selection section of the MDG Technology Wizard, follow the steps below:

Step	Description	See Also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the Scripts checkbox. The MDG Technology Wizard - Scripts dialog displays.	Creating MDG Technologies, Step 6 <small>[1065]</small>
2	For each required script available in the current model, select the checkbox next to the script name.	
3	Click on the Next button to proceed.	

Notes:

- This facility is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect

Learn More:

- [The Scriptor Window](#)
[1817]

6.10.1.2.1.11 Add RTF Report Templates

When creating an MDG Technology file, you can include user-defined RTF Report templates.

To use the report templates section of the MDG Technology Wizard, follow the steps below:

Step	Description	See Also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the RTF Templates checkbox The MDG Technology Wizard - RTF Report Templates dialog displays	Creating MDG Technologies, Step 6 <small>[1065]</small>
2	For each required user-defined report template available in the current model, select the checkbox next to the template name	
3	Click on the Next button to proceed	

6.10.1.2.1.12 Add Linked Document Templates

When creating an MDG Technology file, you can include Linked Document templates.

To use the Linked Document templates section of the MDG Technology Wizard, follow the steps below:

Step	Description	See Also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the Linked Document Templates checkbox. The MDG Technology Wizard - Linked Document Templates dialog displays.	Creating MDG Technologies, Step 6 <small>[1065]</small>

Step	Description	See Also
2	For each required document template available in the current model, select the checkbox next to the template name.	
3	Click on the Next button to proceed.	

6.10.1.2.2 Working with MTS Files

An MDG Technology Selection (.MTS) file stores the selected options that you define when creating an MDG Technology File using the MDG Technology Wizard. If you use a .MTS file, you can edit it to change the features selected when you generated the file, and to add or remove the advanced features described in this topic.

Action	Description	See also
Create an .MTS File	To create a .MTS file, select the Tools Generate MDG Technology File menu option to launch the MDG Technology Wizard, and work through the screens as described in the Create MDG Technology topic. On the second page, select the Create a new MTS file option.	Create MDG Technologies ^[1064]
Advanced Options For Your .MTS File	<p>Once you have created the .MTS file, you can add:</p> <ul style="list-style-type: none"> Model Search definitions. If you use a custom SQL search, the SQL must include <i>ea_guid AS CLASSGUID</i> and the <i>object type</i>. Model Views. Technology views do not store Favorite packages, only Views. If your exported views run searches that you have defined you must also include those searches in your MDG Technology. Model Validation configurations Model Templates. <p>Open the .MTS file in a text editor. To make it easier for you, you can copy the following lines and paste them into the file before the last line of the file (that is, just before the <code></ MDG. Sel ect i ons ></code> lines:</p> <pre><Model Searches file=" " / > <Model Views file=" " / ></pre> <p>(The code for the model validation configurations and model templates is provided in the corresponding sections, accessed via the links in the list above.)</p> <p>You can, if necessary, have more than one line for each inclusion; for example, more than one <i>ModelSearch</i>. For each inserted line:</p> <ul style="list-style-type: none"> In the <code>f i l e</code> attribute, enter the filename of the Model Search XML file or Model View XML file. <p>Save the .MTS file.</p>	Model Search Definitions ^[482] Model Views ^[469] Model Validation Configurations ^[1086] Model Templates ^[1087]
Update the MDG Technology	Again select the Tools Generate MDG Technology File menu option, but this time on the second page select Open an Existing MTS file and specify the file path of the .MTS file you have updated. Click on <Next> until the wizard is finished. Your MDG Technology file is updated.	

6.10.1.2.3 Customize Toolbox Profiles

The following is a road map of how to create a set of custom toolboxes for Enterprise Architect.

Step	Action	See also
1	Create a set of Toolbox Profiles that contain the definitions that Enterprise Architect requires to create the toolboxes.	Toolbox Profiles ^[1074]
2	Create a .MTS file containing instructions on how to build your MDG Technology. Use this .MTS file to build your MDG Technology.	Creating MDG Technologies ^[1064]
3	Add some finishing touches: <ul style="list-style-type: none"> • Create hidden sub-menus • Override Enterprise Architect's default toolboxes • Change the default icons for toolbox items. 	Hidden Sub-menus ^[1075] Overriding Default Toolboxes ^[1076] Icons for Toolbox Items ^[1076]

6.10.1.2.3.1 Create Toolbox Profiles

You can create multiple toolbox profiles within an MDG Technology. Each toolbox profile contains definitions that determine what appears in the **Toolbox** when a specific **Toolbox** page is open, either by selecting from the **More tools...** option in the **Toolbox** window, or by opening or creating a diagram of the type that is linked to the toolbox profile.

To create a toolbox profile, follow the steps below

Step	Action	See also
1	Create a diagram in a profile package, and give it a name by which you can refer to it later, such as <i>MyClassDiagram</i>	
	In the Notes field, give the diagram an alias and a description in the following format: <pre>Alias=MyClass; Notes=Structural elements for class diagrams;</pre>	
2	On the diagram, create a Class, name it <i>ToolboxPage</i> and give it the «metaclass» stereotype	
3	Create a «stereotype» element for each of the toolbox pages to create within your toolbox, such as <i>MyClassElements</i> and <i>MyClassRelationships</i> Set their Alias to the text to display in the title bar of each toolbox page, such as <i>My Class Elements</i> and <i>My Class Relationships</i> respectively Use the Notes field to define the tool-tip for each toolbox page; that is, Elements for Class Diagrams and Relationships for Class Diagrams Use the «extends» connector to set the stereotype elements to extend <i>ToolboxPage</i>	Toolbox Page Attributes ^[1075]
4	In the «stereotype» elements, create an attribute for each toolbox item The name of the attribute should be the name of the element or connector to be dropped, including namespace; for example, <i>UML::Package</i> , <i>UML::Class</i> and <i>UML::Interface</i>	

Step	Action	See also
	<p>The toolbox items display in the same order as the attributes in the Class, so make use of the attribute ordering buttons to define the order of your toolbox</p> <p>To name an attribute for an item from your own technology, precede it with your profile name as the namespace, and then follow it in brackets with the element or connector type that you are extending (so that Enterprise Architect knows what object to create); for example, a SysML block element would appear as <code>SysML::Block(UML::Class)</code></p> <p>Click on the links on the right for a complete list of elements and connectors that can be extended</p> <p>To define a toolbox item that allows a pattern to be dropped onto a diagram, name the attribute <code>My Technology::MyPattern(UMLPattern)</code> where <code>MyTechnology</code> is the ID of the technology and <code>MyPattern</code> is the name of the pattern to drop; for example, <code>BusFramework::Builder(UMLPattern)</code></p> <p>You can replace <code>(UMLPattern)</code> with <code>(UMLPatternSilent)</code> to avoid displaying the Add Pattern dialog</p> <p>To define a model-based pattern in a custom toolbox (such as the GoF patterns) create an attribute with a name of the format <code>PatternCategory::PatternName(UMLPattern)</code>; for example: <code>GoF Behavioral Patterns:: Mediator(UML Pattern)</code></p> <p>You might not want to use names such as <code>UML::Package</code> or <code>UML::Class</code> in your toolbox, so give the attributes an Initial Value of, for example, <code>Package</code> or <code>Class</code></p>	<p>Elements Used in Toolboxes ^[1077]</p> <p>Connectors Used in Toolboxes ^[1078]</p>
5	To save the toolbox profile, right-click on the diagram and select the Save as Profile context menu option	

Notes:

- Each profile element incorporated into an MDG Toolbox page enables synchronization of the Tagged Values and Constraints of all elements created from them

Learn More:

- [Synchronize Tags and Constraints](#) ^[1029]

The following attributes can be added to a stereotype Class that extends the `ToolboxPage` metaclass:

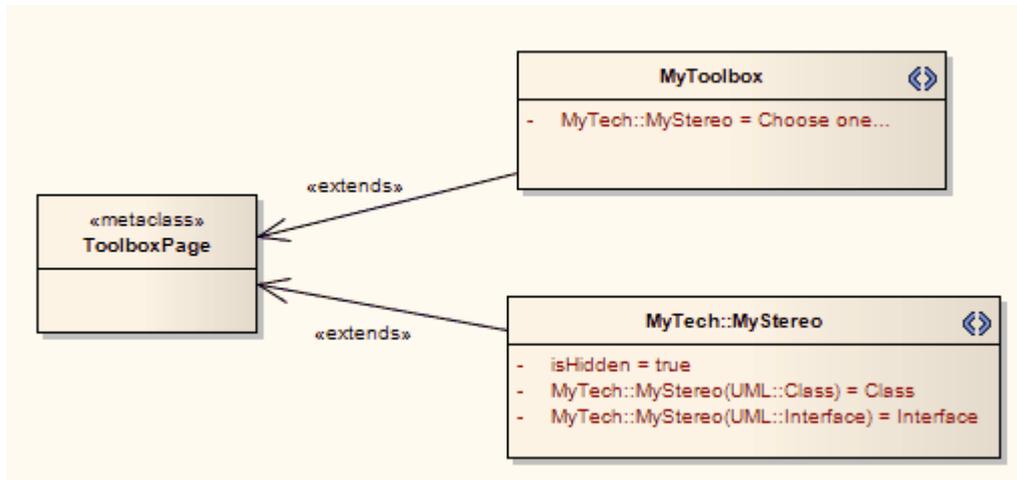

- **ImagesOnly:** if you give a toolbox page an attribute named `imagesOnly` with **Initial Value** set to **true**, the toolbox page displays without the text labels next to the icons
- **isCommon:** if you give a toolbox page an attribute named `IsCommon` with **Initial Value** set to **true**, the toolbox page is common to all defined toolboxes while your technology is active; the page is initially displayed as collapsed
- **isCollapsed:** if you give a toolbox page an attribute named `IsCollapsed` with **Initial Value** set to **true**, the toolbox page is initially minimized.
- **Icon:** see [Assign Icons for Toolbox Items](#) ^[1076]
- **isHidden:** see [Create Hidden Sub-Menus](#) ^[1075]

6.10.1.2.3.2 Create Hidden Sub-Menus

To create a sub-menu, create an additional «*stereotype*» element in the same toolbox profile and give it an attribute named `isHidden` with **Initial Value** of **true**. Define the toolbox item attributes as before. In the parent «*stereotype*» element, create an attribute with the identical name to the sub-menu element. The sub-menu element can have an alias.

This technique is very useful for 'disambiguating' stereotypes that can be applied to multiple metaclasses. In the example below, the «*MyStereo*» stereotype can be applied to either a Class or an Interface. On dragging

and dropping one from the toolbox, a hidden menu displays giving the choice of Class or Interface, then the appropriate element is dropped:

6.10.1.2.3.3 Override Default Toolboxes

Enterprise Architect has many default Toolbox Profiles, one for each of its inbuilt diagram types. These define the Toolbox pages that are displayed, by default, every time a diagram of a specific type is opened or brought into view.

To replace one of Enterprise Architect's default toolboxes with one of your own (for example, if you have your own version of the UML::Class toolbox that you want to be opened every time a Class diagram is opened - as long as your technology is active) then include a *RedefinedToolbox* clause in the **Notes** field for the diagram properties of your Toolbox Profile diagram. For example, the profile diagram's **Notes** field could resemble the following:

```
RedefinedToolbox=UML::Class; Alias=Class; Notes=Structural elements for Class diagrams;
```

This states that the toolbox defined by this profile replaces the Enterprise Architect toolbox *UML::Class* as the default toolbox for all UML Class diagrams. For a list of inbuilt toolboxes, see the [List of Enterprise Architect Toolboxes](#)^[1077] topic.

6.10.1.2.3.4 Assign Icons To Toolbox Items

To assign an icon to a toolbox item, follow the steps below

Step	Action	See also
1	Create a new «stereotype» element in the same toolbox profile as the toolbox item.	
2	Give the «stereotype» element the same name as the attribute that it is assigning an image to (for example, MyTech::MyStereo(UML::Class) in the diagram below)	
3	Give the «stereotype» element an attribute named <i>Icon</i> with Initial Value set to the full path and file name of the image to be used. The icon image is a 16x16 pixel bitmap file; for a transparent background, use light grey - RGB(192,192,192).	

Step	Action	See also
4	Create an Extends association from the «stereotype» element to a «metaclass» element named <i>ToolboxItemImage</i> .	

6.10.1.2.3.5 List of Enterprise Architect Toolboxes

The following is a list of the **Toolbox** pages that can be overridden:

- UML::Activity
- UML::Class
- UML::Communication
- UML::Component
- UML::Composite
- UML::Deployment
- UML::Interaction
- UML::Metamodel
- UML::Object
- UML::Profile
- UML::State
- UML::Timing
- UML::UseCase
- Extended::Analysis
- Extended::Custom
- Extended::DataModeling
- Extended::Maintenance
- Extended::Requirements
- Extended::UserInterface
- Extended::WSDL
- Extended::XMLSchema

6.10.1.2.3.6 Elements Used in Toolboxes

The following elements (all preceded with the namespace **UML::**) can be extended or redefined in Enterprise Architect Toolbox pages. The text in red indicates the label name displayed in the default Enterprise Architect Toolbox pages, where this differs in any way from the **UML::** statement text.

When these profile elements are incorporated into an MDG Toolbox page, they enable [synchronization](#)^[1029] of the Tagged Values and Constraints of all elements created from them.

You can also extend [connectors](#)^[1079].

6.10.1.2.4 Create Custom Diagram Profiles

You can create extended diagram types in Enterprise Architect and include them in MDG Technologies. To create extended diagram types, follow the steps below:

Step	Action	See also
1	Create a profile with the same name as the MDG Technology in which it is to be included; for example, SysML. (However, check the Note in <i>Define Child Diagram Types</i> .)	Defining Child Diagram Types ^[1057]
2	Create a « <i>stereotype</i> » Class element that is named as the custom diagram, for example, <i>BlockDefinition</i> .	
3	Create a Class element and name it as one of the Built-In Diagram Types prefixed with <i>Diagram_</i> , for example <i>Diagram_Logical</i> for Class diagrams or <i>Diagram_Use Case</i> for Use Case diagrams.	Built-In Diagram Types ^[1081]
4	Give the <i>Diagram_x</i> Class the « <i>metaclass</i> » stereotype and draw an « <i>extends</i> » connector from the stereotype to the metaclass.	
5	In the Notes field, give the stereotype Class a brief description of what the diagram is used for. This description displays in the bottom right-hand corner of the New Diagram dialog.	
6	Give the <i>Diagram_x</i> Class the following attributes as required: <ul style="list-style-type: none"> • <i>alias</i>: <i>string</i> = <i>Type</i> (where <i>Type</i> appears before the word 'Diagram' on the diagram title bar) • <i>diagramID</i>: <i>string</i> = <i>abc</i> (where <i>abc</i> is the diagram type that appears in the diagram frame label) • <i>toolbox</i>: <i>string</i> = <i>ToolboxName</i> (where <i>ToolboxName</i> is the name of the toolbox profile for the toolbox that opens automatically each time a diagram is opened) • <i>frameString</i>: <i>string</i> = <i>FrameFormatString</i> (where <i>FrameFormatString</i> is a string containing substitution macros for defining the frame title, with or without additional delimiters such as () ; macros that can be used are: <ul style="list-style-type: none"> • #DGMSTEREO# • #DGMID# • #DGMTYPE# • #DGMALIAS# • #DGMOWNERNAME# • #DGMOWNERNAMEFULL# • #DGMNAME# • #DGMNAMEFULL# • <i>swimlanes</i>: <i>string</i> = <i>Lanes=2;Orientation=Horizontal;Lane 1=Title 1; Lane 2=Title 2;</i> (where <i>Lanes</i> can be any value, but the number of <i>Lane<n></i> values must equal the value of <i>Lanes</i>; <i>Orientation</i> can be omitted, in which case the swimlanes default to vertical) • <i>StyleEx</i>: <i>string</i> = one or more of a range of values; see Attribute Values - StyleEx & pdata • <i>pdata</i>: <i>string</i> = one or more of a range of values; see Attribute Values - StyleEx & pdata. 	Diagram Frame ^[888] Attribute Values - StyleEx & pdata ^[1081]
7	Save the diagram as a profile in the usual manner.	
8	Add the diagram profile to the .MTS file used in the MDG Technology.	Add Diagram Types ^[1088]

The following example shows the DFD diagram profile which defines a DFD diagram as an extension of the Enterprise Architect Analysis diagram.

6.10.1.2.4.1 Built-In Diagram Types

The following is a full list of built-in diagram types provided by Enterprise Architect.

- Activity
- Analysis
- Collaboration
- Component
- CompositeStructure
- Custom
- Deployment
- InteractionOverview
- Logical
- Object
- Package
- Sequence
- Statechart
- Timing
- Use Case

Note the use of *Logical* for Class diagrams and also notice the space in the middle of *Use Case*. These names are used in [Defining Child Diagram Types](#)^[1057], or prefixed by *Diagram_* in creating [Diagram Profiles](#)^[1080].

6.10.1.2.4.2 Attribute Values - StyleEx & pdata

When creating a diagram profile, you can use the *pdata* and *StyleEx* attributes to define a range of characteristics of the diagrams created with the profile. If the attribute is defining several characteristics at once, put the values in a single string separated by semicolons. For example:

StyleEx: string = HideQuals=0;AdvanceElementProps=1;ShowNotes=1;

StyleEx: string =

- *AdvancedConnectorProps=1;* (to show connector property strings)
- *AdvancedElementProps=1;* (to show the element property string)
- *AdvancedFeatureProps=1;* (to show the feature property string)
- *AttPkg=1;* (to show package visible Class members)
- *DefaultLang=Language;* (to set the default language for the diagram; *Language* can be one of Enterprise Architect's built-in languages such as C++ or Java, or it can be a custom language)
- *HandDrawn=1;* (to apply hand drawn mode)
- *HideQuals=0;* (to show qualifiers and visibility indicators)

- *SeqTopMargin=50*; (to set the height of the top margin on sequence diagrams)
- *ShowAsList=1*; (to make the diagram open directly into the [Diagram List](#)^[462])
- *ShowMaint=1*; (to show the element Maintenance compartment)
- *ShowNotes=1*; (to show the element Notes compartment)
- *ShowOpRetType=1*; (to show the operation return type)
- *ShowTests=1*; (to show the element Testing compartment)
- *SuppConnectorLabels=1*; (to suppress all connector labels)
- *SuppressBrackets=1*; (to suppress brackets on operations without parameters)
- *TConnectorNotation=Option*; (where *Option* is one of **UML 2.1**, **IDEF1X**, or **Information Engineering**)
- *TExplicitNavigability=1*; (to show non-navigable connector ends)
- *VisibleAttributeDetail=1*; (to show attribute details on the diagram)
- *Whiteboard=1*; (to apply whiteboard mode)

pdata: string =

- *HideAtts=0*; (to show the element Attributes compartment)
- *HideEStereo=0*; (to show element stereotypes in the diagram)
- *HideOps=0*; (to show the element Operations compartment)
- *HideParents=0*; (to show additional parents of elements in the diagram)
- *HideProps=0*; (to show property methods)
- *HideRel=0*; (to show relationships)
- *HideStereo=0*; (to show attribute and operation stereotypes)
- *OpParams=3*; (to show operation parameters)
- *ShowCons=1*; (to show the element Constraints compartment)
- *ShowIcons=1*; (to use stereotype icons)
- *ShowReqs=1*; (to show the element Requirements compartment)
- *ShowSN=1*; (to show sequence notes)
- *ShowTags=1*; (to show the element Tagged values compartment)
- *SuppCN=0*; (to show collaboration numbers)
- *UseAlias=1*; (to use the aliases or elements in the diagram, if available).

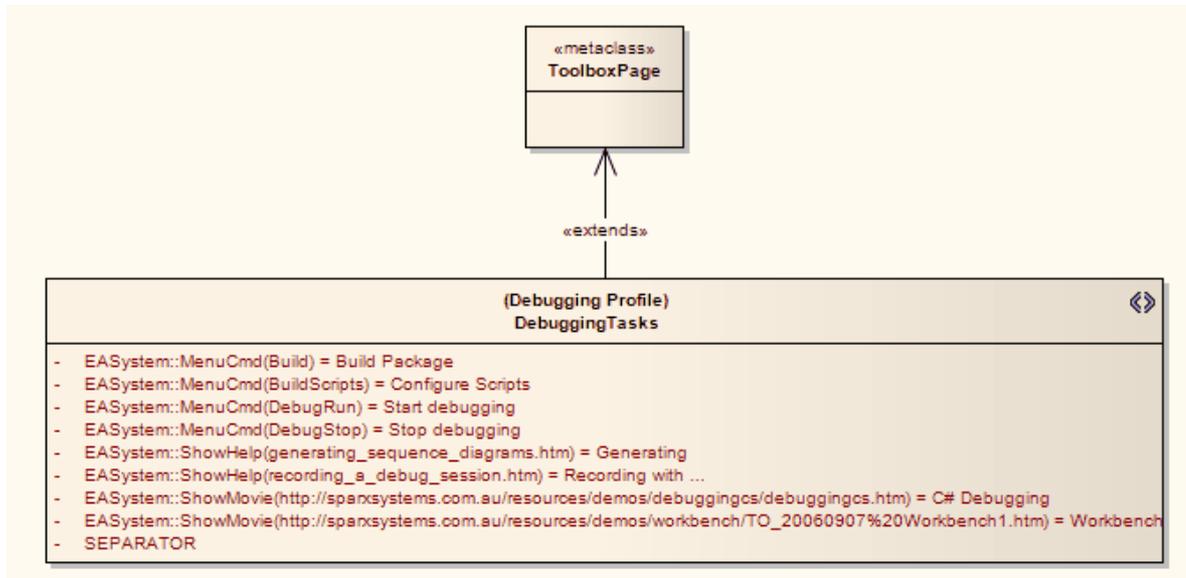

6.10.1.2.5 Create Learning Center Profiles

Defining Learning Center profiles is a four-part process:

Step	Action	See also
1	Define toolboxes; create any number of stereotype elements that each define a Learning Center Toolbox page	Define Learning Center Toolboxes ^[1083]
2	Define contexts; create any number of stereotype elements that each define a named context A context might be when a specific diagram type is open, or when a specific element type is selected	Define Learning Center Contexts ^[1085]
3	Allocate contexts to toolboxes; define the many-to-many relationships between the Learning Center toolboxes and the available contexts	Allocate Learning Center Contexts ^[1086]
4	Create the profile and incorporate it into your Technology	Create Learning Center Profile ^[1086] Add Learning Center Pages ^[1069]

6.10.1.2.5.1 Define Learning Center Toolboxes

A Learning Center toolbox is defined by a «stereotype» Class that extends a «metaclass» ToolboxPage element. These elements must be owned by a «profile» package. Each «stereotype» Class represents the contents of the Learning Center for a given context, and each attribute of the «stereotype» Class defines a command button in the Learning Center. The following diagram shows an example of a Learning Center toolbox.

The title bar of the Learning Center toolbox is defined by the Alias of the «stereotype» Class, in this case *Debugging Profile*. This example uses the following standard attribute types:

- **EASystem::MenuCmd.** These entries name an Enterprise Architect main menu command inside round brackets. See the complete [list of inbuilt commands](#) ^[1084]. Type the text to appear in the Learning Center into the **Initial Value** field.
- **EASystem::ShowHelp.** These entries name a page from the *Enterprise Architect User Guide* inside round brackets. To find out the names of pages in the *Enterprise Architect User Guide*, right-click on the page and select the **Properties** context menu option. Type the text to appear in the Learning Center into the **Initial Value** field.
- **EASystem::ShowMovie.** These entries give the URL of a movie inside round brackets. Type the text to appear in the Learning Center into the **Initial Value** field.
- **SEPARATOR.** This entry indicates that a separator should be placed in the Learning Center toolbox. If it is necessary to place multiple separators in a single toolbox, note that Enterprise Architect does not allow identically named attributes for a Class: simply change the case of one or more letters to get around the problem.

Other useful attributes include:

- **EASystem::ShowURL.** This entry gives the URL of a web page inside round brackets. Type the text to appear in the Learning Center into the **Initial Value** field.
- **isCommon:** A boolean attribute with **Initial Value** set to **True**, defines a Learning Center toolbox as context-free and common, appearing for all contexts
- You can also [run Add-In functions](#) ^[1084] from the Learning Center.

Next Step

The next step is to create a set of [Learning Center Contexts](#) ^[1085].

The following Enterprise Architect commands can all be used in user-defined Learning Center profiles. Learning Center pages have attributes named in the form *EASystem::MenuCmd(<CommandName>)* where *<CommandName>* is the name chosen from the following list:

- AddDiagram
- AddElement
- AddPackage
- AutoRecordThread
- AddModelFromPattern
- Build
- BuildScripts
- ConfigureCSV
- ConfigureValidation
- CreateBaseLine
- CreateSequenceDiagram
- DebugPause
- DebugRun
- DebugStop
- Deploy
- DiagramsOnlyReport
- ElementUsage
- ExportXML
- FileNew
- FileOpen
- GenerateDDL
- GenerateWSDL
- GenerateXMLSchema
- ImplementationDetails
- ImportBinary
- ImportExportCSV
- ImportSchema
- ImportSourceDirectory
- ImportWSDL
- ImportXML
- ImportXMLSchema
- Run
- RunHTMLReport
- RunRTFReport
- SetClassifier
- ShowHideExecution
- StartDebugRecording
- StepInto
- StepOut
- StepOver
- StopDebugRecording
- Test
- TestingReport
- ToggleLevelNumbering
- TransformPackage
- TransformSelectedElements
- ValidateModel
- ViewAuditing
- ViewDebug
- ViewElementList
- ViewForum (for **Team Review** window)
- ViewHierarchy (for **Traceability** window)
- ViewMaintenance
- ViewOutput
- ViewProjectManagement
- ViewRelationships
- ViewRelMatrix
- ViewRequirementTypes
- ViewRules
- ViewSearch
- ViewSourceCode
- ViewTaggedValues
- ViewTesting
- ViewTestingDetails
- ViewWebBrowser

To run Add-In functions from the Learning Center, you create an attribute in the Learning Center «*stereotype*» Class with the following format:

```
" Assembly : : FunctionName ( ) "
```

where *Assembly* is the name of the Add-In and *FunctionName* is the name of a public function in the Add-In. Give the attribute an initial value of the text that is to appear in the Learning Center. The function receives two parameters and returns a success status, as in the following VB.Net example:

```
Public Function ShowMyDiagram(ByRef Repository As EA.Repository, ByVal
args As Object) As String
    Dim ret As String
    ret = Repository.SQLQuery("select ea_guid from t_diagram where
diagram_type='Custom' and StyleEx like
'*;MDGDgm=MyDiagrams::MyCustomDiagram;*'")
    If ret Is Nothing Then
        ShowMyDiagram = False
        Exit Function
    End If

    Dim oXML As MSXML2.DOMDocument = New MSXML2.DOMDocument
    oXML.LoadXML(ret)
```

```

Dim NodeList As MSXML2.IXMLDOMNodeList = oXML.selectNodes("//
ea_guid")
If NodeList.Length = 0 Then
    ShowMyDiagram = False
    Exit Function
End If

Dim Node As MSXML2.IXMLDOMNode
Dim diag As EA.Diagram
If NodeList.Length >= 1 Then
    Node = NodeList.item(0)
    diag = Repository.GetDiagramByGuid(Node.text)
    Repository.OpenDiagram(diag.DiagramID)
    Repository.ShownProjectView(diag)
End If

ShowMyDiagram = True
End Function

```

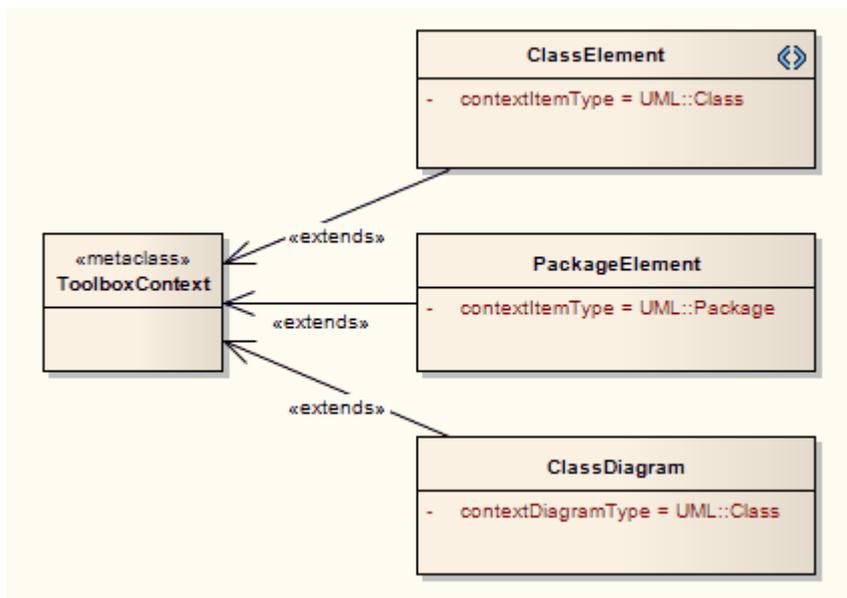

6.10.1.2.5.2 Define Learning Center Contexts

Named Contexts

To create a context-sensitive set of Learning Centers, you must define a set of named contexts that can be used in the definition. A named context is a «*stereotype*» Class which extends a «*metaclass*» named *ToolboxContext*. These elements must be owned by the same «*profile*» package that owns the [Learning Center toolbox definitions](#) ^[1085]. The context Class has one of the following attributes:

- contextDiagramType; this should have an **Initial Value** set to a valid diagram type
- contextItemType; this should have an **Initial Value** set to a valid element type
- contextKey.

Example Context Profile

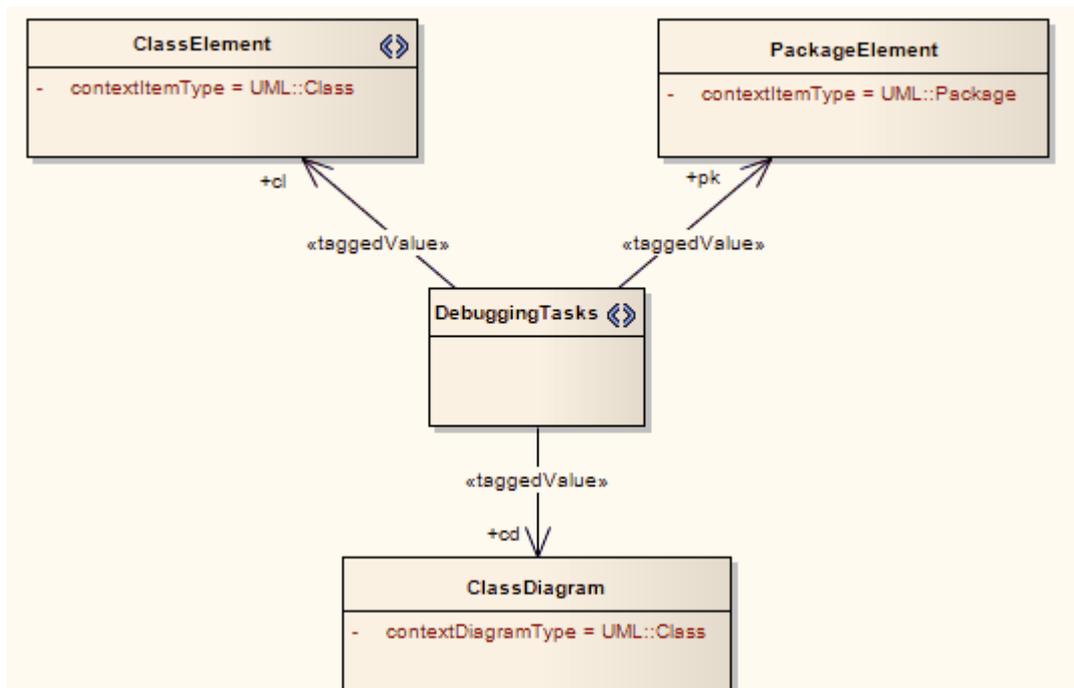

Next Step

The next step is to [allocate Learning Center contexts to Learning Center toolboxes](#) ^[1086].

6.10.1.2.5.3 Allocate Learning Center Contexts

Once you have defined your [Learning Center toolboxes](#) ^[1083] and [Learning Center contexts](#) ^[1085], you can allocate your toolboxes as many contexts as apply, and any number of toolboxes can be allocated to a single context. This is done by creating a «taggedValue» connector from the toolbox element to the context element. The Association end at the context end must be named. The following diagram shows how this might appear.

Next Step

The next step is to [Save your Learning Center Profile](#) ^[1086].

6.10.1.2.5.4 Save a Learning Center Profile

The best organization structure for the model in which you are creating your Learning Center Profile is:

- A single «profile» package
- Three diagrams within the «profile» package named *Toolboxes*, *Contexts* and *Context Allocations*
- Each toolbox page «stereotype» element is owned by the «profile» package and appears on the *Toolboxes* and *Context Allocations* diagrams
- Each context «stereotype» element is owned by the «profile» package and appears on the *Contexts* and *Context Allocations* diagrams
- Each «metaclass» element is owned by the «profile» package and appears on the *Toolboxes* or *Contexts* diagram.

From this structure, creating a Learning Center Profile is as simple as right-clicking on the «profile» package in the Project Browser and selecting the **Save Package as UML Profile** context menu option.

6.10.1.2.6 Define Validation Configuration

The Model Validation Configuration dialog can be opened using the **Project | Model Validation | Configure...** menu option. Using this dialog, you can choose which sets of validation rules are and are not executed when a user performs a validation. Rather than perform this configuration manually and potentially have to change the settings every time Enterprise Architect is started and a different technology is set active, you can

define the configuration settings within the MTS file.

To specify a set of rules as a white-list (that is, anything added to this list is turned ON), open your MTS file in a text editor and copy and paste the following `<Model Validation>` block at the top level inside the `<MDG. Selections>` block:

```
<Model Validation>
  <RuleSet name="BPMNRules"/> <!-- ruleset ID defined in the Project.
  DefineRuleCategory call -->
  <RuleSet name="MVR7F0001"/> <!-- notice you can turn on/off system
  rules as well! -->
</Model Validation>
```

Ensure that the ruleset IDs do not contain any spaces.

To specify a set of rules as a black-list (that is, anything added to this list is turned OFF), open your MTS file in a text editor and copy and paste the following `<Model Validation>` block at the top level inside the `<MDG. Selections>` block:

```
<Model Validation isBlackList="true">
  <RuleSet name="BPMNRules"/>
  <RuleSet name="MVR7F0001"/>
</Model Validation>
```

In the examples above, "BPMNRules" is the rule-set ID defined in the Project.

DefineRuleCategory call - see [Project Interface](#)^[192] for details. "MVR7F0001" is one of Enterprise Architect's built-in rule-sets. These validation options are applied when you activate the appropriate technology. The global (default) technology has all rules turned on.

6.10.1.2.7 Incorporate Model Templates

Model Templates can be added into a model, either on creation of the model, or at any time by right-clicking on a package in the **Project Browser** and selecting the **Add | Add a New Model using Wizard...** context menu option. To include your own model templates in this dialog, add them to your MDG Technology as described in the following table:

Step	Action	See also
1	Create a package that contains all sub-packages, diagrams, elements, notes and information links that you want to provide in the model template. See the <i>Model Templates</i> section and the EAExample.eap model for illustrations of what you might include, or create a model from a standard template and see what is generated. Your model template package must be self contained and not contain any dependencies or other links to elements outside the package.	Model Templates ^[519] Model Wizard ^[518]
2	Export your package to XML.	Export to XML ^[320]
3	Create a reference to the XML file in the MTS file. Open your MTS file in a text editor and copy and paste the following <code><Model Templates></code> block at the top level inside the <code><MDG. Selections></code> block: <pre><Model Templates> <Model name="Template Name" description="This is the description." location="MyTemplatePackage.xml" default="yes" icon="34" filter="Filter Name"/> </Model Templates></pre>	Working with MTS Files ^[1073]

You can include as many `<Model Templates>` blocks in your MTS file as you have model templates. The attributes have the following meanings:

- **Model name:** The name of the model template to show in the **Select model(s)** dialog, which displays

when you create a new model or when you execute the **Add a New Model using Wizard** menu option.

- **description:** The text to display in the **Select model(s)** dialog when the name is selected.
- **location:** The path of the XML file that contains the XML export of the model template package, relative to the location of the MDG Technology file. If the XML file is in the same folder as the technology file then this just contains the file name.
- **default:** Contains either **yes** to indicate that the model template is checked by default, or **no** to indicate that the model template is un-checked by default.
- **icon:** Contains an index to Enterprise Architect's base icons list. To show the appropriate view icon, use one of the following values: **29** = Use Case, **30** = Dynamic; **31** = Class; **32** = Component; **33** = Deployment; **34** = Simple.
- **filter:** If you have a large number of model templates, you can group them on the **Select model(s)** dialog by giving all the model templates in the same group the same filter name. The filter name given appears in the **Select from:** list box in the **Select model(s)** dialog.

6.10.1.2.8 Set Up Technology Element Images

This topic outlines how to capture images to represent MDG Technology elements, so that the images are displayed on a diagram a user creates through the technology when it is deployed in the user's model. Note that you would probably work backwards and forwards through the steps many times, adding objects as you identify the requirement for them.

To capture images to represent MDG Technology elements, follow the steps below

Step	Action	See also
1	Import suitable images into the MDG Technology development model from various sources, using the Add New button on the Image Manager.	Image Manager ^[593]
2	Design and create a Stereotype (UML) Profile containing (if appropriate) a stereotype definition for each element or connector to be owned by the technology. These stereotype definitions can contain Shape Scripts that in turn incorporate the imported images.	Stereotype (UML) Profile ^[103] Shape Scripts ^[104] Drawing Methods ^[109]
3	Design and create a Toolbox Profile with stereotype elements that contain an attribute for each element or connector that can be dropped onto a diagram from the toolbox. These attributes identify the name of the technology element or connector, any modifying stereotype (which might incorporate the required image) and the UML or Extended element or connector on which the technology object is based. For example: <i>SysML::Block(UML::Class)</i> , where <i>SysML</i> is the Technology Profile, <i>UML::Class</i> is the UML element used as the base, and <i>Block</i> is the stereotype that modifies the Class to turn it into a SysML Block element.	Toolbox Profiles ^[107]
4	Design and create a Diagram Profile that identifies the Toolbox Profile. When a diagram of the type defined in the Diagram Profile is opened, it in turn opens a set of toolbox pages as defined by the Toolbox Profile.	Diagram Profiles ^[108]
5	Create or update the technology as required, adding the Stereotype Profile, Diagram Profile, Toolbox Profile and Image files to the technology from the development model.	Creating MDG Technologies ^[106] Adding Stereotype Profile ^[106] Adding Diagram Profile ^[106] Adding Toolbox Profile ^[106] Adding Image Files ^[107]

Step	Action	See also
6	Deploy the technology as appropriate. When a user applies the technology to their own model, and creates a diagram under that technology, the elements they create on the diagram should be represented by the images you assigned to those elements when you created the technology.	Deploying MDG Technologies ^[1089]

6.10.1.2.9 Deploy An MDG Technology

An MDG Technology can be deployed in one of two ways: as a file or from an Add-In.

Deploy From a File

To deploy your technology as a file, you have a number of choices:

- Import it into the %APPDATA% folder. See the [Import MDG Technologies](#) ^[1035] topic.
- Copy it to a folder named MDG Technologies, which you must create under your Enterprise Architect installation directory (by default this is C:\Program Files\Sparx Systems\EA). When you restart Enterprise Architect, your MDG Technology is deployed.
- Copy it to any folder in your file system, including network drives: use the Enterprise Architect **Settings | MDG Technologies...** menu option, press the **Advanced** button and add the folder to the Technologies path. This deployment method enables you to quickly and easily deploy a technology to all Enterprise Architect users on a LAN.
- Upload it to an internet or intranet location: use the Enterprise Architect **Settings | MDG Technologies...** menu option, press the **Advanced** button and add the URL to the Technologies path. This deployment method enables you to quickly and easily deploy a technology to an even wider group of Enterprise Architect users.

Deploy From an Add-in

To deploy your technology from an Add-In, you must write an [EA_OnInitializeTechnologies](#) ^[2035] function. The following example is written in VB.Net:

```
Public Function EA_OnInitializeTechnologies(ByVal Repository As EA.
Repository) As Object
    EA_OnInitializeTechnologies = My.Resources.MyTechnology
End Function
```

6.10.1.3 Shape Scripts

Introduction

Enterprise Architect *Shape Scripts* enable you to specify custom shapes via a scripting language. These custom shapes are drawn instead of the standard UML notation. Each script is associated with a particular stereotype, and is drawn for every element of that stereotype. The following topics describe how to create and apply Shape Scripts:

- [Getting Started with Shape Scripts](#) ^[1090]
- [Write Scripts](#) ^[1091]
- [Example Scripts](#) ^[1104]
- [Shape Editor](#) ^[1090]
- [Add Shape Scripts to UML Profiles](#) ^[1046]

6.10.1.3.1 Getting Started With Shape Scripts

Step	Action	See also
1	<i>Shape Scripts</i> are associated with stereotypes and are defined via the Stereotypes tab of the UML Types dialog. To access this dialog, select the Settings UML Types menu option. Each stereotype defined can have a Shape Script.	
2	You can create a Shape Script for an existing stereotype by selecting the stereotype from the list. Alternatively, you can create new stereotypes by clicking on the New button and giving the stereotype a name. Select a base Class and click on the Save button. Once the stereotype is saved, it displays in the list.	
3	To override the appearance, select the Shape Script radio button and then click on the Assign button. The Shape Script Editor displays.	
4	Type the example Shape Scripts in the Edit window. You can click on the Refresh button in order to view the shape in the preview window.	
5	If you define a composite Shape Script (such as the connector at the end of the Example Scripts topic), click on the Next Shape button to page through the components of the shape.	
6	Once you have finished writing your Shape Script, click on the OK button. To save the Shape Script you must click on the Save button on the Stereotypes tab.	
7	Once you have created your Shape Script for a particular stereotype, you can assign that stereotype to an element or connector. The appearance reflects the Shape Script you created. To do this, drag and drop the appropriate element or connector into your diagram.	
8	Right-click on the element or connector and select the Properties context menu option. Click on the Stereotype field drop-down arrow, select the stereotype you created and click on the OK button. The object's shape now reflects the Shape Script you created.	

Notes:

- If an element's appearance is modified by a Shape Script, many of the options on the **Advanced** context menu for that element are disabled.

6.10.1.3.2 Shape Editor

The **Shape Editor** enables you to create Shape Scripts. It provides the facilities of the *Common Code Editor*, including intellisense for Shape Script attributes and functions.

How to:

To access the Shape Editor, follow the steps below:

1. Select **Settings | UML Types > Stereotypes**
2. In the **Stereotype** field, type a name or click on an the required stereotype in the list
3. From the **Override Appearance** panel, select the **Shape Script** radio button
4. Click on the **Assign** button. The **Shape Editor** dialog displays

Complete the fields on the dialog as explained in the following table.

Field	Usage	See also
Format	Select the Shape Script version.	
Import	Import a Shape Script from a text file.	
Export	Export a Shape Script to a text file.	
OK	Exit from the Shape Editor , don't forget to save your script from the Stereotypes tab.	Getting Started With Shape Scripts ^[1090]
Next Shape	Rotate though the multiple shape definitions.	
Refresh	Parse your script and display the result in the Preview window.

MethodName	::=	See Drawing Methods ^[1094] for a full listing of method names

6.10.1.3.3.2 Shape Attributes

syntax: attribute "=" value ","

example:

```

shape main
{
    // Initialisation attributes - must be before drawing commands
    noshadow = "true";
    h_align = "center";

    // drawing commands
    rectangle(0, 0, 100, 100);
    println("foo bar");
}

```

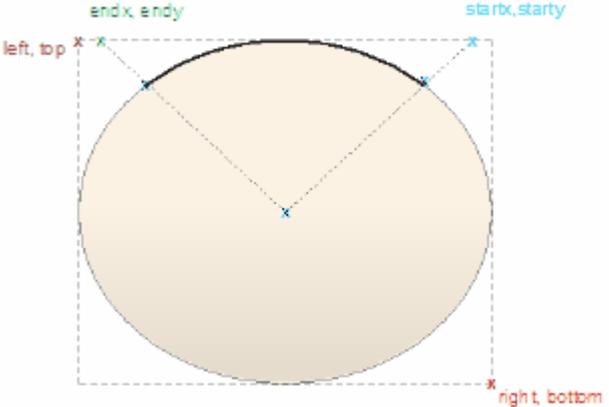

Attribute Name	Type	Description	See also
bottomAnchorOffset	(int,int)	When creating a Shape Script for an embedded element (such as a Port), use this attribute to offset the shape from the bottom edge of its parent. For example: <i>bottomAnchorOffset=(0,-10)</i> ; move embedded element up 10 pixels from the bottom edge	

Attribute Name	Type	Description	See also
dockable	<i>string</i>	Makes the shape default to dockable, so that it can be aligned with and joined to other elements (both other Shape Scripts and standard elements) on a diagram. You cannot reverse the dockable status with the Appearance menu option; to change the status, you must edit the Shape Script. Valid values: standard or off	Appearance Menu Section ^[656]
editableField	<i>string</i>	Defines a shape as an editable region of the element. This field impacts element shapes only, line glyphs are not supported. Valid Values: alias , name , note , stereotype	
endPointY, endPointX	<i>integer</i>	Only used for the reserved target and source shapes for connectors; this point determines where the main connector line connects to the end shapes. Default: 0 and 0	
fixedAspectRatio	<i>string</i>	Set to true to fix the aspect ratio. Do not use if you do not want to fix the aspect ratio.	
h_Align	<i>string</i>	Affects horizontal placement of printed text and subshapes depending on the layoutType attribute. Valid values: left , center , or right	
layoutType	<i>string</i>	Determines how subshapes are sized and positioned. See Subshape Layout for further details. Valid values: leftright , topdown , border	Subshape Layout ^[1102]
leftAnchorOffset	<i>(int,int)</i>	When creating a Shape Script for an embedded element (such as a Port), use this attribute to offset the shape from the left edge of its parent. For example: <i>leftAnchorOffset=(10,0)</i> ; move embedded element right 10 pixels from the left edge	
noShadow	<i>string</i>	Set to true to suppress the shapes shadow from being rendered. Valid values: true or false (default= false)	
orientation	<i>string</i>	Applies to decoration shapes only. Determines where the decoration is positioned within the containing element glyph. Valid values: NW , N , NE , E , SE , S , SW , W	
preferredHeight		Used by border layoutType - north and south Used in drawing the source and target shapes for connectors to determine how wide the line is.	
preferredWidth		Used by border layoutType - east and west. Used by leftright layoutType, shapes where	

Attribute Name	Type	Description	See also
		<i>scalable</i> is false to determine how much space they occupy for layout purposes.	
rightAnchorOffset	<i>(int,int)</i>	When creating a Shape Script for an embedded element (such as a Port), use this attribute to offset the shape from the right edge of its parent. For example: <i>rightAnchorOffset=(-10,0)</i> ; move embedded element left 10 pixels from the right edge	
rotatable	<i>string</i>	Set to false to prevent rotation of the shape. This attribute is only applicable to the source and target shapes for lines glyphs. Valid values: true or false (default = true)	
scalable	<i>string</i>	Set to false to stop the shape from being relatively sized to the associated diagram glyph. Valid values: true or false (default= true)	
topAnchorOffset	<i>(int,int)</i>	When creating a Shape Script for an embedded element (such as a Port), use this attribute to offset the shape from the top edge of its parent. For example: <i>topAnchorOffset=(0,10)</i> ; move embedded element down 10 pixels from the top edge	
v_Align	<i>string</i>	Affects vertical placement of printed text and subshapes depending on the layoutType attribute. Valid values: top , center , or bottom	

6.10.1.3.3.3 Drawing Methods

Method Name	Description	See also
addsubshape (string shapename (, int width, int height))	Adds a sub-shape with the name shapename that must be defined within the current shape definition	
arc (int left, int top, int right, int bottom, int startingpointx , int startingpointy , int endingpointx , int endingpointy)	Draws an elliptical anticlockwise arc with the ellipse having extents at left , top , right and bottom The start point of the arc is defined by the intersection of the ellipse and the line from the center of the ellipse to the point (startingpointx , startingpointy) The end of the arc is similarly defined by the intersection of the ellipse and the line from the center of the ellipse to the point (endingpointx , endingpointy) For example: <pre>Ar c (0 , 0 , 100 , 100 , 95 , 0 , 5 , 0) ;</pre>	

Method Name	Description	See also
	 <p>The diagram shows a light brown circular arc. A dashed rectangle represents its bounding box. The top-left corner of the rectangle is labeled 'left, top' in red. The top-right corner is labeled 'startx, starty' in blue. The bottom-right corner is labeled 'right, bottom' in red. The bottom-left corner is labeled 'endx, endy' in blue. A dashed line connects the top-left and top-right corners, and another dashed line connects the top-right and bottom-right corners. A dashed line also connects the top-left and bottom-right corners, passing through the center of the arc.</p>	
arco (int left, int top, int right, int bottom, int startingpointx, int startingpointy, int endingpointx, int endingpointy)	<p>As for the arc method, except that a line is drawn from the current position to the starting point of the arc, and then the current position is updated to the end point of the arc</p>	
bezierto (int controlpoint1x, int controlpoint1y, int controlpoint2x, int controlpoint2y, int endpointx, int endpointy)	<p>Draws a bezier curve and updates the pen position</p>	
defSize(int width, int height)	<p>Sets the default size of the element</p> <p>This can appear in IF and ELSE clauses with different values in each, and causes the element to be resized automatically each time the values change; for example:</p> <pre> if (HasTag(" horizontal ", " true")) { def Si ze(100, 20); r ect angl e(0, 0, 100, 100); } el se { def Si ze(20, 100); r ect angl e(0, 0, 100, 100); } </pre> <p>The above example sets the shape to the specified default size each time the Tagged Value <i>horizontal</i> is changed</p>	

Method Name	Description	See also
	When this is set, (Alt+Z) also resizes the shape to the defined dimensions The minimum value for both int width and int height is 10	
drawnativeshape()	Causes Enterprise Architect to render the shape using its usual, non-Shapescript notation; subsequent drawing commands are super-imposed over the native notation This method is only enabled for element Shape Scripts; line Shape Scripts are not supported	
ellipse(int left, int top, int right, int bottom)	Draws an ellipse with extents defined by left , top , right and bottom	
endpath()	Ends the sequence of drawing commands that define a path	
fillandstrokepath()	Fills the previously defined path with the current fill color, then draws its outline with the current pen	
fillpath()	Fills the previously defined path with the current fill color	
hidelabel(string labelname)	Hides the label specified by labelname , where labelname is one of the following values: <ul style="list-style-type: none"> • middletoplabel • middlebottomlabel • lefttoplabel • leftbottomlabel • righttoplabel • rightbottomlabel 	
image(string imageld, int left, int top, int right, int bottom)	Draws the image that has the name imageld in the Image Manager The image must exist within the model in which the stereotype is used; if it does not already exist in the model, you must import it as reference data or select it from within a technology file If the image is in a technology file, it should have a filename of the format <i><technology ID>::<imagename>.<extension></i>	Reference data ^[239] Adding images in MDG technology ^[107]
lineto(int x, int y)	Draws a line from the current cursor position to a point specified by x and y , and then updates the pen cursor to that position	
moveto(int x, int y)	Moves the pen cursor to the point specified by x and y	
polygon(int centerx, int centery, int numberofsides,	Draws a regular polygon with center at the point (centerx , centery), and numberofsides number of sides	

Method Name	Description	See also
int radius, float rotation)		
print(string text)	Prints the specified text string You cannot change the font size, type or color of this text	
printifdefined(string propertyname, string truepart(, string falsepart))	Prints the <i>truepart</i> if the given property exists and has a non-empty value, otherwise prints the optional <i>falsepart</i> You cannot change the font size, type or color of this text	
println(string text)	Appends a line of text to the shape and a line break You cannot change the font size, type or color of this text	
printwrapped(string text)	Prints the specified text string, wrapped over multiple lines if the text is wider than its containing shape You cannot change the font size, type or color of this text	
rectangle(int left, int top, int right, int bottom)	Draws a rectangle with extents at left, top, right, bottom . Values are percentages	
roundrect(int left, int top, int right, int bottom, int abs_cornerwidth, int abs_cornerheight)	Draws a rectangle with rounded corners, with extents defined by left, top, right and bottom The size for the corners is defined by abs_cornerwidth and abs_cornerheight ; these values do not scale with the shape	
setdefaultcolors()	Returns the brush and pen color to the default settings, or to the user-defined colors if available	Color Queries ^[1099]
setfillcolor(int red, int green, int blue) setfillcolor(Color newColor)	Sets the fill color You can specify the required color by defining RGB values or using a color value returned by any of the Color Queries such as: Get User Fill Color ()	Color Queries ^[1099]
setfixedregion(int xStart, int yStart, int xEnd, int yEnd)	Fixes a region in a connector into which a subshape can be drawn, so that the subshape is not rescaled with the length or orientation of the connector line For an example, see the end of the table in the <i>Example Scripts</i> topic	Example Scripts ^[1104]
setlinestyle(string linestyle)	Changes the stroke pattern for commands that use the pen	

Method Name	Description	See also
	<p>string linestyle: has the following valid styles:</p> <ul style="list-style-type: none"> • solid • dash • dot • dashdot • dashdotdot 	
setorigin (string relativeTo , int xOffset , int yOffset)	<p>Positions floating text labels relative to the main shape</p> <p>relativeTo is one of N, NE, E, SE, S, SW, W, NW, CENTER</p> <p>xOffset and yOffset are in pixels, not percentage values, and can be negative</p>	
setpen (int red , int green , int blue (, int penwidth))	<p>Sets the pen to the defined color and optionally sets the pen width</p> <p>This method is only for line-drawing commands. It does not affect any text commands</p>	
setpencolor (int red , int green , int blue) setpencolor (Color newColor)	<p>Sets the pen color</p> <p>You can specify the required color by defining RGB values or using a color value returned by any of the Color Queries; for example:</p> <p style="padding-left: 40px;">Get User Fill Color ()</p> <p>This method is only for line-drawing commands. It does not affect any text commands</p>	Color Queries ^[1099]
setpenwidth (int penwidth)	<p>Sets the width of the pen. Pen width should be between 1 and 5</p> <p>This method is only for line-drawing commands. It does not affect any text commands</p>	
showlabel (string labelname)	<p>Reveals the hidden label specified by labelname, where labelname is one of the following values:</p> <ul style="list-style-type: none"> • middletoplabel • middlebottomlabel • lefttoplabel • leftbottomlabel • righttoplabel • rightbottomlabel 	
startcloudpath (puffWidth, puffHeight, noise)	<p>Similar to StartPath, except that it draws the path with cloud-like curved segments (<i>puffs</i>)</p> <p>Parameters:</p> <ul style="list-style-type: none"> • <i>float</i> puffWidth (default = 30), the horizontal distance between puffs • <i>float</i> puffHeight (default = 15), the vertical distance between puffs • <i>float</i> noise (default = 1.0), the randomization of the puffs' positions 	
startpath ()	<p>Starts the sequence of drawing commands that define a path</p>	

Method Name	Description	See also
<code>strokepath()</code>	Draws the outline of the previously defined path with the current pen	

6.10.1.3.3.4 Color Queries

Color queries can only be used to retrieve arguments for the *SetPenColor* and *SetFillColor* commands. These queries can be used in place of the arguments.

```
getUserFillColor()
getUserBorderColor()
getUserFontColor()
getUserPenSize()
```

```
shape main
{
    setfillcolor(getuserbordercolor());
    setpencolor(getuserfillcolor());

    rectangle(0, 0, 100, 100);
}
```

6.10.1.3.3.5 Conditional Branching

Shape Scripts provide condition branching with the *if else* statement, and query methods that evaluate to either *True* or *False*. See:

- [Syntax Grammar](#)^[1097] for IF statement syntax.
- [Query Methods](#)^[1099] for methods that can be used as the conditional expression for IF statements.
- [Example Scripts](#)^[1104] for an example.

6.10.1.3.3.6 Query Methods

Two query methods are available for seeing if the associated element has certain tags or properties; these methods can be used as the conditional expression for an *if else* statement.

Method	Description	See also
<code>boolean HasTag(string tagname, (string tagvalue))</code>	Returns true if the associated element has a tag value with the name <i>tagname</i> If the second parameter <i>tagvalue</i> is provided, the tag <i>tagname</i> must be present, and the value of the tag has to be equal to <i>tagvalue</i> for the method to return true	
<code>boolean HasProperty(string propertyname, (string propertyvalue))</code>	Returns true if the associated element has a property with the name <i>propertyname</i> If the second parameter <i>propertyvalue</i> is provided, the property must be present, and the value of the property has to be equal to <i>propertyvalue</i> for the method to return true	Display Element/Connector Properties ^[1099]

6.10.1.3.3.7 Display Element/Connector Properties

The commands `print`, `println`, and `printwrapped` all take a string parameter representing the text to be printed. Element and connector properties can be added to the text using the substitution macro `#propertyname#`.

For example: `println("name: #NAME#");`

In addition to the properties listed below, Tagged Values can also be displayed by prefixing the Tagged Value name with TAG:.

For example: `print("#TAG:condition#");`

You can also test against and display an element's *custom* properties in the same way as you do the named properties.

For example: `if(hasproperty("Name","Value"))`

...

and: `print("#Name#");`

Properties for Element Shape Scripts

6.10.1.3.3.8 Sub-Shapes

Shapes can contain - and be composed of - other shapes.

Subshape Layout:

To set the layout type, the *layoutType* attribute must be set in the *initialization attributes* section of the script; in other words, before any of the methods are called. Valid values for this attribute are:

- **LeftRight** - Shapes with leftright layout position subshapes side by side, with the first added on the left, and subsequent subshapes to the right
- **TopDown** - TopDown places subshapes in a vertical arrangement, with the first shape added to the top and subsequent shapes added below
- **Border** - Border layout requires an additional argument to the *addsubshape* method to specify which region of the containing shape the subshape is to occupy: N, E, S, W or CENTER; each region can only be occupied by one subshape

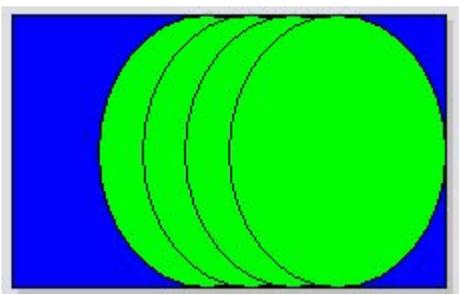

A subshape that is assigned to the E or W region must have its *preferredwidth* attribute specified in its declaration and, similarly, subshapes added to N or S must have their *preferredheight* attribute set; in this case, the values for these attributes are treated as static lengths and do not scale glyphs

For example:

```
shape main
{
  layouttype="topdown";
  setfillcolor(0,0,255);
  rectangle(0,0,100,100);
  addsubshape("sub",50,100,20,0);
  addsubshape("sub",50,100,30,-100);
  addsubshape("sub",50,100,40,-200);
  addsubshape("sub",50,100,50,-300);

  shape sub
  {
    setfillcolor(0,255,0);
    ellipse(0,0,100,100);
  }
}
```

The above script provides the following shape:

6.10.1.3.3.9 Reserved Names

Elements

Elements (such as Class, State or Event) have the following reserved names for parts of the shape.

Name	Description
shape main	The main shape is the whole shape.
shape label	The shape label gives the shape a detached label.
decoration <identifier>	Decoration gives the shape a decoration as defined by the name in <identifier>.

Connectors

Connectors (such as Association, Dependency or Generalization) have the following reserved names for parts of the shape.

Name	Description
shape main	The main shape is the whole shape.
shape source	The source shape is an extra shape at the source end of the connector.
shape target	The target shape is an extra shape at the target end of the connector.
shape <labelID>	The <labelID> gives the connector a detached label, where <labelID> is one of the following: <ul style="list-style-type: none"> • LeftTopLabel • MiddleTopLabel • RightTopLabel • LeftBottomLabel • MiddleBottomLabel • RightBottomLabel

6.10.1.3.3.10 Miscellaneous

Return Command

Execution of the script can be terminated by using the return command. Please see [Example Scripts](#) ¹¹⁰⁴ for an example.

Looping

The Shape Script feature does not support looping constructs.

Comments

C-style comments are supported. For example:

```
// C Style Single Line comment
/* Multi Line
comment supported */
```

String Manipulation

Not Supported.

Arithmetical Operations

Not Supported.

Variables Declaration

Not Supported.

Change ShapeScript Fonts

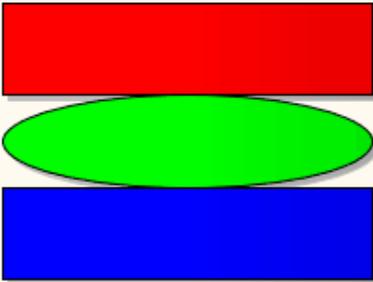

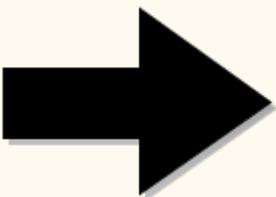

Not possible.

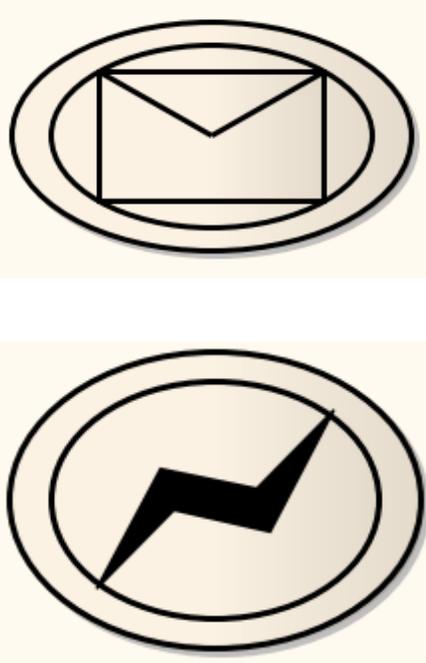

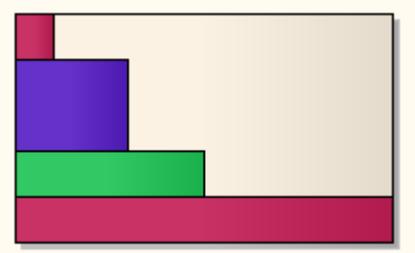

Can I apply a Shapescrpt without using Stereotypes?

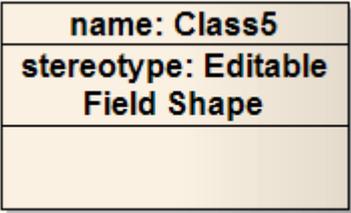

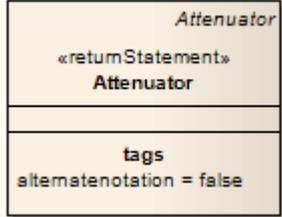

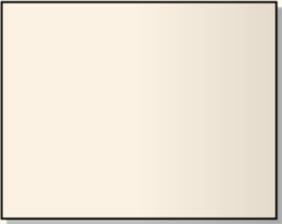

No.

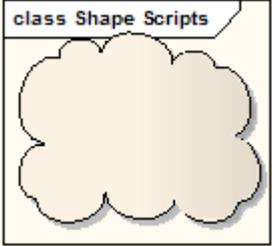

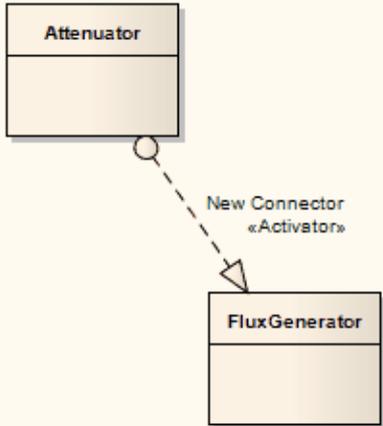

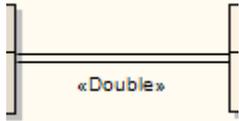

6.10.1.3.4 Example Scripts

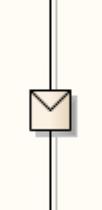

Below is a selection of example Shape Scripts.

Code	Result
<pre>// BASIC SHAPES shape main { setfillcolor(255,0,0); // (R,G,B) rectangle(0,0,90,30); // (x1,y1,x2,y2) setfillcolor(0,255,0); // (R,G,B) ellipse(0,30,90,60); // (x1,y1,x2,y2) setfillcolor(0,0,255); // (R,G,B) rectangle(0,60,90,90); // (x1,y1,x2,y2) }</pre>	
<pre>// SINGLE CONDITIONAL SHAPE shape main { if (HasTag("Trigger","Link")) { // Only draw if the object has a Tagged Value // Trigger=Link // Set the fill color for the path setfillcolor(0,0,0); startpath(); // Start to trace out a path moveto(23,40); } }</pre>	

Code	Result
<pre> lineto(23,60); lineto(50,60); lineto(50,76); lineto(76,50); lineto(50,23); lineto(50,40); endpath(); // End tracing out a path // Fill the traced path with the fill color fillandstrokepath(); return; } </pre>	
<pre> // MULTI CONDITIONAL SHAPE shape main { startpath(); ellipse(0,0,100,100); endpath(); fillandstrokepath(); ellipse(3,3,27,27); if (HasTag("Trigger", "None")) { return; } if (HasTag("Trigger", "Error")) { setfillcolor(0,0,0); startpath(); moveto(23,77); lineto(37,40); lineto(60,47); lineto(77,23); lineto(63,60); lineto(40,53); lineto(23,77); endpath(); fillandstrokepath(); return; } if (HasTag("Trigger", "Message")) { rectangle(22,22,78,78); moveto(22,22); lineto(50,50); lineto(78,22); return; } } </pre>	
<pre> // SUB SHAPES shape main { rectangle(0,0,100,100); addsubshape("red", 10, 20); addsubshape("blue", 30, 40); addsubshape("green", 50, 20); addsubshape("red", 100, 20); shape red { </pre>	

Code	Result
<pre> setfillcolor(200, 50, 100); rectangle(0,0,100,100); } shape blue { setfillcolor(100, 50, 200); rectangle(0,0,100,100); } shape green { setfillcolor(50, 200, 100); rectangle(0,0,100,100); } </pre>	
<pre> // EDITABLE FIELD SHAPE shape main { rectangle(0,0,100,100); addsubshape("namecompartment", 100, 20); addsubshape("stereotypercompartment", 100, 40); shape namecompartment { h_align = "center"; editablefield = "name"; rectangle(0,0,100,100); println("name: #name#"); } shape stereotypercompartment { h_align = "center"; editablefield = "stereotype"; rectangle(0,0,100,100); println("stereotype: #stereotype#"); } } </pre>	
<pre> // RETURN STATEMENT SHAPE shape main { if(hasTag("alternatenotation", "false")) { //draw ea's inbuild glyph drawnativeshape(); //exit script with the return statement return; } //alternate notation commands //... rectangle(0,0,100,100); } </pre>	 

Code	Result
<pre>// CLOUD PATH EXAMPLE SHAPE shape main { StartCloudPath(); Rectangle(0,0,100,100); EndPath(); FillAndStrokePath(); } </pre>	
<pre>// CONNECTOR SHAPE shape main { // draw a dashed line noshadow=true; setlinestyle("DASH"); moveto(0,0); lineto(100,0); } shape source { // draw a circle at the source end rotatable = true; startpath(); ellipse(0,6,12,-6); endpath(); fillandstrokepath(); } shape target { // draw an arrowhead at the target end rotatable = true; startpath(); moveto(0,0); lineto(16,6); lineto(16,-6); endpath(); fillandstrokepath(); } </pre>	
<pre>// DOUBLE LINE shape main { setlinestyle("DOUBLE"); moveto(0,0); lineto(100,0); } </pre>	
<pre>// ROTATION DIRECTION shape main { moveto(0,0); lineto(100,0); setfixedregion(40,-10,60,10); rectangle(40,-10,60,10); if(hasproperty("rotationdirection","up")) moveto(60,-10); lineto(50,0); lineto(60,10); } </pre>	

Code	Result

6.10.1.4 Tagged Value Types

Enterprise Architect provides a number of predefined Tagged Value Types that enable you to create your own:

- Tagged Values that are structured with a specific format, with or without tag filters, or
- Tagged Values that return values from the various reference data tables.

You can also use a masking parameter to create your own customized masked Tagged Value Type.

Notes:

- You can transport Tagged Value Type definitions between models, using the Export Reference Data and Import Reference Data options; Tagged Value Types are exported as *Property Types*

- [Export Reference Data](#) ^[237]
- [Import Reference Data](#) ^[239]

6.10.1.4.1 Predefined Structured Types

This table details the predefined structured Tagged Value types, along with the syntax used to create the initial values for their use. You use these to create your own structured Tagged Values.

Tagged Value Type and **Format** entries are case-sensitive.

Tagged Value Type	Format	Description	See also
AddinBroadcast	Type=AddinBroadcast: Values=YourAddinName;	Allows an AddIn to respond to an attempt to edit this Tagged Value by showing a dialog in which the value and notes can be edited	

Tagged Value Type	Format	Description	See also
Boolean	Type=Boolean; Default=Val;	Enables input of True or False , either of which can be the default value	
Classifier	Type=Classifier; Values=Type1,Type2; Stereotypes=Stereotype1;	Deprecated - use RefGUID and RefGUIDList Returns the <i>name</i> of a user-selected element from the model, where Type1 and Type2 specify one or more allowed element types and Stereotype1 represents an allowed stereotype	
Color	Type=Color; Default=Val;	Enables input of a color value from a color chooser menu, where the value is the decimal integer translation of the color's Hex RGB value For example, the RGB for Red is FF , and the decimal value is 255	
Const	Type=Const; Default=Val;	Enables creation of a read-only constant value	
Custom	Type= Custom;	Enables you to create your own template for predefined types; more information is provided in the Create Custom Tagged Value Type topic.	Create Custom Tagged Value Type <small>[1115]</small>
DateTime	Type=DateTime;	Enables input of the date and time for the Tagged Value from a calendar menu.	
Directory	Type=Directory; Default=Val;	Enables entry of a directory path from a browser. You can set a default directory path as a string value.	
Enum	Type=Enum; Values=Val1,Val2,Val3; Default=Val2;	Enables definition of a comma-separated list, where Val1 , Val2 and Val3 represent values in the list and Default represents the default value of the list.	
File	Type=File; Default=Val;	Enables input of a filename from a file browser dialog. The named file can be launched in its default application You can set a default file as a string containing the file path and file name	
Float, Decimal, Double	Type=Float; Type=Decimal; Type=Double; Default=Val;	Enable entry of a Float, Decimal or Double value. These types all map to the same type of data. You can set a default for any or all of these.	
Integer	Type=Integer; Default=Val;	Enables entry of an Integer value, and a default.	
Memo	Type=Memo;	Enables input of large and complex Tagged Values.	

Tagged Value Type	Format	Description	See also
RefGUID	Type=RefGUID; Values=Type1,Type2; Stereotypes=Stereotype1;	Enables the Tagged Value to reference an element from the model by specifying the element's <i>GUID</i> , where Type1 and Type2 specify one or more allowed diagram objects (such as Class , Component , Attribute or Operation) and Stereotype1 represents an allowed stereotype. Set the classifier, attribute or operation for a Tagged Value of this type by clicking on the (...) button against the Tagged Value in the Tagged Value window.	Classifier [690], Attribute or Operation [694]
RefGUIDList	Type=RefGUIDList; Values=Type1,Type2; Stereotypes=Stereotype1;	Enables the Tagged Value to reference a list of elements from the model by specifying each element's <i>GUID</i> , where Type1 and Type2 specify one or more allowed diagram objects (such as Class or Component) and Stereotype1 represents an allowed stereotype. Set the classifier, attribute or operation for a Tagged Value of this type by clicking on the (...) button against the Tagged Value in the Tagged Value window.	Classifier [690], Attribute or Operation [694]
Spin	Type=Spin; LowerBound=x; UpperBound=x; Default=Val;	Enables creation of a spin control with the value of LowerBound being the lowest value and UpperBound being the highest value. You can also set a default within that range.	
String	Type=String; Default=Val;	Enables entry of a string value, up to 255 characters in length, and a default text string. For longer texts, use Type=Memo.	Type= Memo [1109]
URL	Type=URL; Default=Val;	Enables entry of a web URL. The URL should start with: <ul style="list-style-type: none"> • 'http:/' • 'https:/' or • 'www.' You can set a default URL as a string value.	

Tag Filters:

The following table details filters that can be used to restrict where a Tagged Value can be applied.

Filter	Format	Description	See also
Applies To	AppliesTo=Type1,Type2;	Restricts the element types this filter can be applied to, where Type1 and Type2 are the valid types. Possible values are: <ul style="list-style-type: none"> • all element types 	

Filter	Format	Description	See also
		<ul style="list-style-type: none"> all connector types Attribute Operation and OperationParameter. 	
BaseStereotype	BaseStereotype=S1,S2;	Restricts the stereotypes that this tag belongs to, where S1 and S2 are the allowed stereotypes.

- [Predefined Reference Data](#) ^[1117]

6.10.1.4.5 Create Custom Tagged Value Type

Custom masked Tagged Values give you great flexibility in designing model components that accept data entries.

How to:

To create a masked Tagged Value follow the steps below:

Step	Action	See Also
1	Select the Settings UML Types menu option The UML Types dialog displays; select the Tagged Value Types tab	
2	In the Tag field type an appropriate name for the Tagged Value	
3	In the Description field type the purpose of the Tagged Value, if required	
4	In the Detail field type Type=Custom;	

The type **Custom** enables you to set up the appropriate mask, using the following characters to define the format of the mask:

Mask	Description
D	Enables the Tagged Value to display digits only.
d	Enables the Tagged Value to display digits or spaces.
+	Enables the use of +, - or spaces.
C	Enables the use of alpha characters only.
c	Enables the Tagged Value to be an alpha character or a space.
A	Enables the use of alphanumeric characters.
a	Enables the Tagged Value to use alphanumeric values or a space.

In the diagram below the **Mask** configuration option shows syntax that first defines seven blank spaces, which are occupied by characters determined by the template option. The first two visible characters in the **Mask** option are represented by a lower case **c** indicating that the enableable information can entered as either an alpha character or as a space. The following blank spaces again indicate space defined by the template option and the remaining characters are defined by the **d** character, which represents the enableable characters as digits or spaces. The hyphen is present in the final output, splitting up the digits.

With the **Template** configuration option, the syntax defines the template of the masked option by occupying the blank spaces that are present in the **Mask** option. The template is used to ensure that this information is present with every use of this custom Tagged Value. The underscored values indicate the area that is to be occupied by data input by the user as defined in the **Mask** option.

The screenshot shows the 'Tagged Value Types' configuration window. The 'Tag Name' is 'MemberZip' and the 'Description' is 'Zip Code'. The 'Detail' section contains the following configuration:

```
Type=Custom:
Mask= cc dddd.dddd;
Template=State: __Zip: ____-____;
```

Below the detail section are 'New', 'Save', and 'Delete' buttons. At the bottom, a table lists 'Defined Tag Types' with columns 'Type' and 'Description'. The 'MemberZip' entry is highlighted in blue.

Type	Description
IORules	IORules
MemberZip	Zip Code

6.10.1.5 Code Template Framework

The Code Template Framework (CTF) is used during forward engineering of UML models. This section discusses how you customize the way in which Enterprise Architect generates source code, using the [Code Template Editor](#).^[114]

Enterprise Architect's code templates specify the transformation from UML elements to the various parts of a given programming language. The templates are written as plain text with a [syntax](#).^[115] that shares some

aspects of both mark-up languages and scripting languages. The Base Templates provided in Enterprise Architect are described in the [Base Templates](#) topic.

6.10.1.5.1 Code Template Syntax

Code Templates are written as plain text, using Enterprise Architect's code template editor (see [The Code Template Editor](#)). The template syntax centers on three basic constructs:

- [Literal Text](#)
- [Macros](#)
- [Variables](#)

Templates can contain any or all of these constructs.

6.10.1.5.1.1 Literal Text

All text within a given template that is not part of a macro or a variable definition/reference, is considered literal text. With the exception of blank lines, which are ignored, literal text is directly substituted from the template into the generated code.

Consider the following excerpt from the java Class Declaration template:

```
%PI =" " %
%CONVERT_SCOPE( classScope) %

%classStereotype=="static" ? "static": "" %
%classStereotype=="final" ? "final": "" %
%classStereotype=="static final" ? "static final": "" %
%classAbstract=="T" ? "abstract": "" %
%PI =" " %
class %className%$bases
```

On the final line, the word *class*, including the subsequent space, would be treated as literal text and thus reproduced in the output. The blank line following the *CONVERT_SCOPE* macro, however, would have no effect on the output.

The %, \$ and " characters have special meaning in the template syntax and cannot always be used as literal text. If these characters must be generated from within the templates, they can be safely reproduced using the following direct substitution macros:

Macro	Action
%dl%	Produce a literal \$ character.
%pc%	Produce a literal % character.
%qt%	Produce a literal " character.

6.10.1.5.1.2 Macros

Macros provide access to element fields within the UML model and are also used to structure the generated output. All macros are enclosed within percent (%) signs. The CTF contains six basic types of macros:

- [Template substitution macros](#)
- [Field substitution macros](#)
- [Tagged Value substitution macros](#)
- [Control macros](#)
- [Function macros](#)
- [EASL code generation macros](#)

In general, macros (including the % delimiters) are substituted with literal text in the output. For example

consider the following item from the *Class Declaration* template:

```
... class %className% ...
```

The field substitution macro, `%className%`, would result in the current Class name being substituted in the output. So if the Class being generated was named *Foo*, the output would be:

```
... class Foo ...
```

Template substitution macros correspond to [Base templates](#)^[1483]. These macros result in the execution of the named template. By convention, template macros are named according to Pascal casing.

Structure: %<TemplateName>%

where `<TemplateName>` can be one of the templates listed below.

When a template is referenced from within another template, it is generated with respect to the elements currently in scope. The specific template is selected based on the stereotypes of the elements in scope.

As noted previously, there is an implicit hierarchy among the various templates. Some care should be taken in order to preserve a sensible hierarchy of template references. For example, it does not make sense to use the `%ClassInherits%` macro within any of the attribute or operation templates. Conversely, the *Operation* and *Attribute* templates are designed for use within the *ClassBody* template.

The CTF contains the following template substitution macros:

- AttributeDeclaration
- AttributeNotes
- Attribute
- Class
- ClassImpl
- ClassBase
- ClassBody
- ClassBodyImpl
- ClassDeclaration
- ClassDeclarationImpl
- ClassInherits
- ClassInterface
- ClassNotes
- ClassParameter
- File
- FileImpl
- ImportSection
- ImportSectionImpl
- InnerClass
- InnerClassImpl
- LinkedAttribute
- LinkedAttributeNotes
- LinkedAttributeDeclaration
- LinkedClassBase
- LinkedClassInterface
- Namespace
- NamespaceBody
- NamespaceDeclaration
- NamespaceImpl
- Operation
- OperationBody
- OperationBodyImpl
- OperationDeclaration
- OperationDeclarationImpl
- OperationImpl
- OperationNotes
- Parameter

The *field substitution* macros provide access to data in the model. In particular, they are used to access data fields from:

- Packages
- Classes
- Attributes
- Operations
- Parameters.

Field substitution macros are named according to Camel casing. By convention, the macro is prefixed with an abbreviated form of the corresponding model element. For example, attribute-related macros begin with **att**, as in the `%attName%` macro, to access the name of the attribute in scope.

Macros that represent checkboxes return a value of T if the box is selected. Otherwise the value is empty.

The following table lists each of the field substitution macros with a description of the result.

Macro Name	Description
attAlias	Attributes dialog: Alias .
attAllowDuplicates	Attributes Detail dialog: Allow Duplicates checkbox.
attClassifierGUID	The unique GUID for the classifier of the current attribute.
attCollection	Attributes Detail dialog: Attribute is a Collection checkbox.
attConst	Attributes dialog: Const checkbox.
attContainerType	Attributes Detail dialog: Container Type .
attContainment	Attributes dialog: Containment .
attDerived	Attributes dialog: Derived checkbox.
attGUID	The unique GUID for the current attribute.
attInitial	Attributes dialog: Initial .
attIsEnumLiteral	Attributes dialog: Is Literal checkbox.
attLength	Column dialog: Length .
attLowerBound	Attributes Detail dialog: Lower Bound .
attName	Attributes dialog: Name .
attNotes	Attributes dialog: Notes .
attOrderedMultiplicity	Attributes Detail dialog: Ordered Multiplicity checkbox.
attProperty	Attributes dialog: Property checkbox.
attQualType	The attribute type qualified by the namespace path (if generating namespaces) and the classifier path (dot delimited). If the attribute classifier has not been set, is equivalent to the <i>attType</i> macro.
attScope	Attributes dialog: Scope .
attStatic	Attributes dialog: Static checkbox.
attStereotype	Attributes dialog: Stereotype .
attType	Attributes dialog: Type .
attUpperBound	Attributes Detail dialog: Upper Bound .
attVolatile	Attributes Detail dialog: Transient checkbox.
classAbstract	Class dialog: Abstract checkbox.
classAlias	Class dialog: Alias .
classArguments	Class Detail dialog: C++ Templates: Arguments .
classAuthor	Class dialog: Author .
classBaseName	Type Hierarchy dialog: Class Name (for use where no connector exists between child and base Classes).

Macro Name	Description
classBaseScope	The scope of the inheritance as reverse engineered. (For use where no connector exists between child and base Classes.)
classBaseVirtual	The virtual property of the inheritance as reverse engineered. (For use where no connector exists between child and base Classes.)
classComplexity	Class dialog: Complexity .
classCreated	The date and time the Class was created.
classGUID	The unique GUID for the current Class.
classHasConstructor	Looks at the list of methods in the current object and, depending on the conventions of the current language, returns T if one is a default constructor. Typically used with the genOptGenConstructor _[1123] macro.
classHasCopyConstructor	Looks at the list of methods in the current object and, depending on the conventions of the current language, returns T if one is a copy constructor. Typically used with the genOptGenCopyConstructor _[1123] macro.
classHasDestructor	Looks at the list of methods in the current object and, depending on the conventions of the current language, returns T if one is a destructor. Typically used with the genOptGenDestructor _[1123] macro.
classHasParent	True , if the Class in scope has one or more base Classes.
classImports	Code Gen dialog: Imports .
classIsActive	Class Advanced dialog: Is Active checkbox.
classIsInstantiated	True , if the Class is an instantiated template Class.
classIsLeaf	Class Advanced dialog: Is Leaf checkbox.
classIsRoot	Class Advanced dialog: Is Root checkbox.
classIsSpecification	Class Advanced dialog: Is Specification checkbox.
classKeywords	Class dialog: Keywords .
classLanguage	Class dialog: Language .
classMacros	A space separated list of macros defined for the Class.
classModified	The date and time the Class was last modified.
classMultiplicity	Class Advanced dialog: Multiplicity .
className	Class dialog: Name .
classNotes	Class dialog: Note .
classParamDefault	Class Detail dialog.
classParamName	Class Detail dialog.
classParamType	Class Detail dialog.
classPersistence	Class dialog: Persistence .
classPhase	Class dialog: Phase .

Macro Name	Description
classQualName	The Class name prefixed by its outer Classes. Class names are separated by double colons (::).
classScope	Class dialog: Scope .
classStereotype	Class dialog: Stereotype .
classStatus	Class dialog: Status .
classVersion	Class dialog: Version .
connectorAlias	Connector Properties dialog: Alias .
connectorDestAccess	Connector Properties dialog, Target Role tab: Access .
connectorDestAggregation	Connector Properties dialog, Target Role tab: Aggregation .
connectorDestAlias	Connector Properties dialog, Target Role tab: Alias .
connectorDestAllowDuplicates	Connector Properties dialog, Target Role tab: Allow Duplicates checkbox.
connectorDestChangeable	Connector Properties dialog, Target Role tab: Changeable .
connectorDestConstraint	Connector Properties dialog, Target Role tab: Constraint(s) .
connectorDestContainment	Connector Properties dialog, Target Role tab: Containment .
connectorDestDerived	Connector Properties dialog, Target Role tab: Derived checkbox.
connectorDestDerivedUnion	Connector Properties dialog, Target Role tab: DerivedUnion checkbox.
connectorDestElem*	A set of macros that access a property of the element at the target end of a connector. The * (asterisk) is a wildcard that corresponds to any class substitution macro in this list; for example: <i>connectorDestElemAlias (classAlias)</i> , <i>connectorDestElemAuthor (classAuthor)</i> .
connectorDestElemType	The element type of the connector destination element. (Separate from the <i>connectorDestElem*</i> macros because there is no <i>classType</i> substitution macro.)
connectorDestMemberType	Connector Properties dialog, Target Role tab: Member Type .
connectorDestMultiplicity	Connector Properties dialog, Target Role tab: Multiplicity .
connectorDestNavigability	Connector Properties dialog, Target Role tab: Navigability .
connectorDestNotes	Connector Properties dialog, Target Role tab: Role Notes .
connectorDestOrdered	Connector Properties dialog, Target Role tab: Ordered checkbox.
connectorDestOwned	Connector Properties dialog, Target Role tab: Owned checkbox.
connectorDestQualifier	Connector Properties dialog, Target Role tab: Qualifier(s) .
connectorDestRole	Connector Properties dialog, Target Role tab: Role .
connectorDestScope	Connector Properties dialog, Target Role tab: Target Scope .
connectorDestStereotype	Connector Properties dialog, Target Role tab: Stereotype .

Macro Name	Description
connectorDirection	Connector Properties : Direction .
connectorEffect	Transition Constraints dialog: Effect .
connectorGuard	Object Flow and Transition Constraints dialog: Guard .
connectorGUID	The unique GUID for the current connector.
connectorName	Connector Properties : Name .
connectorNotes	Connector Properties : Notes .
connectorSourceAccess	Connector Properties dialog, Source Role tab: Access .
connectorSourceAggregation	Connector Properties dialog, Source Role tab: Aggregation .
connectorSourceAlias	Connector Properties dialog, Source Role tab: Alias .
connectorSourceAllowDuplicates	Connector Properties dialog, Source Role tab: Allow Duplicates checkbox.
connectorSourceChangeable	Connector Properties dialog, Source Role tab: Changeable .
connectorSourceConstraint	Connector Properties dialog, Source Role tab: Constraint(s) .
connectorSourceContainment	Connector Properties dialog, Source Role tab: Containment .
connectorSourceDerived	Connector Properties dialog, Source Role tab: Derived checkbox.
connectorSourceDerivedUnion	Connector Properties dialog, Source Role tab: DerivedUnion checkbox.
connectorSourceElem*	A set of macros that access a property of the element at the source end of a connector. The * (asterisk) is a wildcard that corresponds to any class substitution macro in this list; for example: <i>connectorSourceElemAlias (classAlias)</i> , <i>connectorSourceElemAuthor (classAuthor)</i> .
connectorSourceElemType	The element type of the connector source element. (Separate from the <i>connectorSourceElem*</i> macros because there is no <i>classType</i> substitution macro.)
connectorSourceMemberType	Connector Properties dialog, Source Role tab: Member Type .
connectorSourceMultiplicity	Connector Properties dialog, Source Role tab: Multiplicity .
connectorSourceNavigability	Connector Properties dialog, Source Role tab: Navigability .
connectorSourceNotes	Connector Properties dialog, Source Role tab: Role Notes .
connectorSourceOrdered	Connector Properties dialog, Source Role tab: Ordered checkbox.
connectorSourceOwned	Connector Properties dialog, Source Role tab: Owned checkbox.
connectorSourceQualifier	Connector Properties dialog, Source Role tab: Qualifier(s) .
connectorSourceRole	Connector Properties dialog, Source Role tab: Role .
connectorSourceScope	Connector Properties dialog, Source Role tab: Target Scope .
connectorSourceStereotype	Connector Properties dialog, Source Role tab: Stereotype .
connectorStereotype	Connector Properties dialog: Stereotype .

Macro Name	Description
connectorTrigger	Transition Constraints dialog: Trigger .
connectorType	The connector type; for example, Association or Generalization.
connectorWeight	Object Flow Constraints dialog: Weight .
constraintName	Class dialog, Constraints tab: Name .
constraintNotes	Class dialog, Constraints tab: Notes .
constraintStatus	Class dialog, Constraints tab: Status .
constraintType	Class dialog, Constraints tab: Type .
constraintWeight	Class dialog, Constraints tab: ordering (hand up/down) keys.
eaDateTime	The current time with format: <i>DD-MMM-YYYY HH:MM:SS AM/PM</i> .
eaGUID	A unique GUID for this generation.
eaVersion	Program Version (Located in an Enterprise Architect dialog by selecting Help About EA).
effortName	Project Management window: Effort .
effortNotes	Project Management window: Notes (unlabelled).
effortTime	Project Management window: Time .
effortType	Project Management window: Type .
elemType	The element type: Interface or Class.
fileExtension	The file type extension of the file being generated.
fileName	The name of the file being generated.
fileNameImpl	The filename of the implementation file for this generation, if applicable.
fileHeaders	Code Gen dialog: Headers .
fileImports	Code Gen dialog: Imports . For supported languages this also includes dependencies derived from associations.
filePath	The full path of the file being generated.
filePathImpl	The full path of the implementation file for this generation, if applicable.
genOptActionScriptVersion	ActionScript Specifications dialog: Default Version .
genOptCDefaultAttributeType	C Specifications dialog: Default Attribute Type .
genOptCGenMethodNotesInBody	C Specifications dialog: Method Notes In Implementation .
genOptCGenMethodNotesInHeader	C Specifications dialog: Method Notes In Header .
genOptCSynchNotes	C Specifications dialog: Synchronize Notes in Generation .
genOptCSynchCFile	C Specifications dialog: Synchronise Implementation file in Generation .

Macro Name	Description
genOptCDefaultSourceDirectory	C Specifications dialog: Default Source Directory .
genOptCNamespaceDelimiter	C Specifications dialog: Namespace Delimiter .
genOptCOperationRefParam	C Specifications dialog: Reference as Operation Parameter .
genOptCOperationRefParamStyle	C Specifications dialog: Reference Parameter Style .
genOptCOperationRefParamName	C Specifications dialog: Reference Parameter Name .
genOptCConstructorName	C Specifications dialog: Default Constructor Name .
genOptCDestructorName	C Specifications dialog: Default Destructor Name .
genOptCPPCommentStyle	C++ Specifications dialog: Comment Style .
genOptCPPDefaultAttributeType	C++ Specifications dialog: Default Attribute Type .
genOptCPPDefaultReferenceType	C++ Specifications dialog: Default Reference Type .
genOptCPPDefaultSourceDirectory	C++ Specifications dialog: Default Source Directory .
genOptCPPGenMethodNotesInHeader	C++ Specifications dialog: Method Notes In Header checkbox.
genOptCPPGenMethodNotesInBody	C++ Specifications dialog: Method Notes In Body checkbox.
genOptCPPGetPrefix	C++ Specifications dialog: Get Prefix .
genOptCPPHeaderExtension	C++ Specifications dialog: Header Extension .
genOptCPPSetPrefix	C++ Specifications dialog: Set Prefix .
genOptCPPSourceExtension	C++ Specifications dialog: Source Extension .
genOptCPPSynchCPPFile	C++ Specifications dialog: Synchronize Notes .
genOptCPPSynchNotes	C++ Specifications dialog: Synchronize CPP File .
genOptCSDefaultAttributeType	C# Specifications dialog: Default Attribute Type .
genOptCSSourceExtension	C# Specifications dialog: Default file extension .
genOptCSGenDispose	C# Specifications dialog: Generate Dispose .
genOptCSGenFinalizer	C# Specifications dialog: Generate Finalizer .
genOptCSGenNamespace	C# Specifications dialog: Generate Namespace .
genOptCSDefaultSourceDirectory	C# Specifications dialog: Default Source Directory .
genOptDefaultAssocAttName	Attribute Specifications dialog: Default name for associated attrib.
genOptDefaultConstructorScope	Object Lifetimes dialog: Default Constructor Visibility .
genOptDefaultCopyConstructorScope	Object Lifetimes dialog: Default Copy Constructor Visibility .
genOptDefaultDatabase	Code Editors dialog: Default Database .

Macro Name	Description
genOptDefaultDestructorScope	Object Lifetimes dialog: Default Destructor Constructor Visibility .
genOptGenCapitalisedProperties	Source Code Engineering dialog: Capitalize Attribute Names for Properties checkbox.
genOptGenComments	Source Code Engineering dialog: Generate Comments checkbox.
genOptGenConstructor	Object Lifetimes dialog: Generate Constructor checkbox.
genOptGenConstructorInline	Object Lifetimes dialog: Constructor Inline checkbox.
genOptGenCopyConstructor	Object Lifetimes dialog: Generate Copy Constructor checkbox.
genOptGenCopyConstructorInline	Object Lifetimes dialog: Copy Constructor Inline checkbox.
genOptGenDestructor	Object Lifetimes dialog: Generate Destructor checkbox.
genOptGenDestructorInline	Object Lifetimes dialog: Destructor Inline checkbox.
genOptGenDestructorVirtual	Object Lifetimes dialog: Virtual Destructor checkbox.
genOptGenImplementedInterfaceOps	Attribute/Operations Specifications dialog: Generate methods for implemented interfaces checkbox.
genOptGenPrefixBoolProperties	Source Code Engineering dialog: Use is prefix for boolean property Get() .
genOptGenRoleNames	Source Code Engineering dialog: Autogenerate role names when creating code .
genOptGenUnspecAssocDir	Source Code Engineering dialog: Do not generate members where Association direction is unspecified checkbox.
genOptJavaDefaultAttributeType	Java Specifications dialog: Default attribute type .
genOptJavaGetPrefix	Java Specifications dialog: Get Prefix .
genOptJavaDefaultSourceDirectory	Java Specifications dialog: Default Source Directory .
genOptJavaSetPrefix	Java Specifications dialog: Set Prefix .
genOptJavaSourceExtension	Java Specifications dialog: Source code extension .
genOptPHPDefaultSourceDirectory	PHP Specifications dialog: Default Source Directory .
genOptPHPGetPrefix	PHP Specifications dialog: Get Prefix .
genOptPHPSetPrefix	PHP Specifications dialog: Set Prefix .
genOptPHPSourceExtension	PHP Specifications dialog: Default file extension .
genOptPHPVersion	PHP Specifications dialog: PHP Version .
genOptPropertyPrefix	Source Code Engineering dialog: Remove prefixes when generating Get/Set properties .
genOptVBMultiUse	VB Specifications dialog: Multiuse checkbox.
genOptVBPersistable	VB Specifications dialog: Persistable checkbox.
genOptVBDataBindingBehavior	VB Specifications dialog: Data binding behavior checkbox.

Macro Name	Description
genOptVBDataSourceBehavior	VB Specifications dialog: Data source behavior checkbox.
genOptVBGlobal	VB Specifications dialog: Global namespace checkbox.
genOptVBCreatable	VB Specifications dialog: Creatable checkbox.
genOptVBExposed	VB Specifications dialog: Exposed checkbox.
genOptVBMTS	VB Specifications dialog: MTS Transaction Mode .
genOptVBNetGenNamespace	VB.Net Specifications dialog: Generate Namespace .
genOptVBVersion	VB Specifications dialog: Default Version .
genOptWrapComment	Source Code Engineering dialog: Wrap length for comment lines .
importClassName	The name of the Class being imported.
importFileName	The filename of the Class being imported.
importFilePath	The full path of the Class being imported.
importFromAggregation	T if the Class has an Aggregation connector to a Class in this file, F otherwise.
importFromAssociation	T if the Class has an Association connector to a Class in this file, F otherwise.
importFromAtt	T if an attribute of a Class in the current file is of the type of this Class, F otherwise.
importFromDependency	T if the Class has a Dependency connector to a Class in this file, F otherwise.
importFromGeneralization	T if the Class has a Generalization connector to a Class in this file, F otherwise.
importFromMeth	T if a method return type of a Class in the current file is the type of this Class, F otherwise.
importFromParam	T if a method parameter of a Class in the current file is of the type of this Class, F otherwise.
importFromRealization	T if the Class has a Realization connector to a Class in this file, F otherwise.
importInFile	T if the Class is in the current file, F otherwise.
importPackagePath	The package path with a '.' separator of the Class being imported.
ImportRelativeFilePath	The relative file path of the Class being imported from the file path of the file being generated.
linkAttAccess	Association Properties Target Role dialog: Access .
linkAttCollectionClass	The collection appropriate for the linked attribute in scope.
linkAttContainment	Association Properties Target Role dialog: Containment .
linkAttName	Association Properties dialog: Target .
linkAttNotes	Association Properties Target Role dialog: Role Notes .

Macro Name	Description
linkAttQualName	The Association target qualified by the namespace path (if generating namespaces) and the classifier path (dot delimited).
linkAttRole	Association Properties Target Role dialog: Role .
linkAttStereotype	Association Properties Target Role dialog: Stereotype .
linkAttTargetScope	Association Properties Target Role dialog: Target Scope .
linkCard	Link Properties Target Role dialog: Multiplicity .
linkedFileLastWrite	Class Properties dialog: Last Write .
linkedFileNotes	Class Properties dialog: Notes .
linkedFilePath	Class Properties dialog: File Path .
linkedFileSize	Class Properties dialog: Size .
linkedFileType	Class Properties dialog: Type .
linkGUID	The unique GUID for the current connector.
linkParentName	Generalization Properties dialog: Target .
linkParentQualName	The Generalization target qualified by the namespace path (if generating namespaces) and the classifier path (dot delimited).
linkStereotype	The stereotype of the current connector.
linkVirtualInheritance	Generalization Properties dialog: Virtual Inheritance .
metricName	Project Management dialog, Metrics tab: Metric field.
metricNotes	Project Management dialog, Metrics tab: (Notes) field.
metricType	Project Management dialog, Metrics tab: Type field.
metricWeight	Project Management dialog, Metrics tab: Weight field.
opAbstract	Operation dialog: Virtual checkbox.
opAlias	Operation dialog: Alias .
opBehavior	Operation Behavior dialog: Behavior .
opCode	Operation Behavior dialog: Initial Code .
opConcurrency	Operation dialog: Concurrency .
opConst	Operation dialog: Const checkbox.
opGUID	The unique GUID for the current operation.
opImplMacros	A space-separated list of macros defined in the implementation of this operation.
opIsQuery	Operation dialog: IsQuery checkbox.
opMacros	A space-separated list of macros defined in the declaration for this operation.
opName	Operation dialog: Name .

Macro Name	Description
opNotes	Operation dialog: Notes .
opPure	Operation dialog: Pure checkbox.
opReturnArray	Operation dialog: Return Array checkbox.
opReturnClassifierGUID	The unique GUID for the classifier of the current operation.
opReturnQualType	The operation return type qualified by the namespace path (if generating namespaces) and the classifier path (dot delimited). If the return type classifier has not been set, is equivalent to the <i>opReturnType</i> macro.
opReturnType	Operation dialog: Return Type .
opScope	Operation dialog: Scope .
opStatic	Operation dialog: Static checkbox.
opStereotype	Operation dialog: Stereotype .
opSynchronized	Operation dialog: Synchronized checkbox.
packageAbstract	Package dialog: Abstract .
packageAlias	Package dialog: Alias .
packageAuthor	Package dialog: Author .
packageComplexity	Package dialog: Complexity .
packageGUID	The unique GUID for the current package.
packageKeywords	Package dialog: Keywords .
packageLanguage	Package dialog: Language .
packageName	Package dialog: Name .
packagePath	The string representing the hierarchy of packages, for the Class in scope. Each package name is separated by a dot (.).
packagePhase	Package dialog: Phase .
packageScope	Package dialog: Scope .
packageStatus	Package dialog: Status .
packageStereotype	Package dialog: Stereotype .
packageVersion	Package dialog: Version .
paramClassifierGUID	The unique GUID for the classifier of the current parameter.
paramDefault	Operation Parameters dialog: Default .
paramFixed	Operation Parameters dialog: Fixed checkbox.
paramGUID	The unique GUID for the current parameter.
paramIsEnum	True , if the parameter uses the <i>enum</i> keyword (C++).
paramKind	Operation Parameters dialog: Kind .

Macro Name	Description
paramName	Operation Parameters dialog: Name .
paramNotes	Operation Parameters dialog: Notes .
paramQualType	The parameter type qualified by the namespace path (if generating namespaces) and the classifier path (dot delimited). If the parameter classifier has not been set, is equivalent to the <i>paramType</i> macro.
paramType	Operation Parameters dialog: Type .
problemCompletedBy	Maintenance dialog, Element Issues tab: Completed by .
problemCompletedDate	Maintenance dialog, Element Issues tab: Completed .
problemHistory	Maintenance dialog, Element Issues tab: History .
problemName	Maintenance dialog, Element Issues tab: Name .
problemNotes	Maintenance dialog, Element Issues tab: Description .
problemPriority	Maintenance dialog, Element Issues tab: Priority .
problemRaisedBy	Maintenance dialog, Element Issues tab: Raised by .
problemRaisedDate	Maintenance dialog, Element Issues tab: Raised .

requirementPriority	Properties dialog: Require tab: Priority .
requirementStatus	Properties dialog: Require tab: Status .
requirementType	Properties dialog: Require tab: Type .
resourceAllocatedTime	Project Management window, Resource Allocation tab: Allocated Time .
resourceEndDate	Project Management window, Resource Allocation tab: End Date .
resourceExpectedTime	Project Management window, Resource Allocation tab: Expected Time .
resourceExpendedTime	Project Management window, Resource Allocation tab: Time Expended .
resourceHistory	Project Management window, Resource Allocation tab: History .
resourceName	Project Management window, Resource Allocation tab: Resource .
resourceNotes	Project Management window, Resource Allocation tab: Description .
resourcePercentCompleted	Project Management window, Resource Allocation tab: Completed (%) .

Macro Name	Description
resourceRole	Project Management window, Resource Allocation tab: Role .
resourceStartDate	Project Management window, Resource Allocation tab: Start Date .
riskName	Project Management window, Risks tab: Risk .
riskNotes	Project Management window, Risks tab: (Notes).
riskType	Project Management window, Risks tab: Type .
riskWeight	Project Management window, Risks tab: Weight .
scenarioGUID	The unique ID for a scenario. Identifies the scenario unambiguously within a model.
scenarioName	Properties dialog, Scenario tab: Scenario .
scenarioNotes	Properties dialog, Scenario tab: (Notes).
scenarioType	Properties dialog, Scenario tab: Type .
testAcceptanceCriteria	Testing window: Acceptance Criteria .
testCheckedBy	Testing window: Checked By .
testDateRun	Testing window: Last Run .
testClass	The Testing window tab (the type of test defined): Unit, Integration, System, Acceptance, Scenario .
testInput	Testing window: Input .
testName	Testing window: Test .
testNotes	Testing window: Description .
testResults	Testing window: Results .
testRunBy	Testing window: Run By .
testStatus	Testing window: Status .
testType	Testing window: Type .

Field substitution macros can be used in one of two ways:

Use 1: Direct Substitution

This form directly substitutes the corresponding value of the element in scope into the output.

Structure: %<macroName>%

Where <macroName> can be any of the macros listed above.

Examples:

- %className%
- %opName%
- %attName%

Use 2: Conditional Substitution

This form of the macro enables alternative substitutions to be made depending on the macro's value.

Structure: `%<macroName> (== " <test> ") ? <subTrue> (: <subFalse>) %`

Where:

- `(<text>)` denotes that `<text>` is optional
- `<test>` is a string representing a possible value for the macro
- `<subTrue>` and `<subFalse>` can be a combination of quoted strings and the keyword value; where the value is used, it is replaced with the macro's value in the output.

Examples:

- `%classAbstract=="T" ? "pure" : ""%`
- `%opStereotype=="operator" ? "operator" : ""%`
- `%paramDefault != "" ? " = " value : ""%`

The above three examples output nothing if the condition fails. In this case the false condition can be omitted, resulting in the following usage:.

Examples:

- `%classAbstract=="T" ? "pure" %`
- `%opStereotype=="operator" ? "operator" %`
- `%paramDefault ? " = " value %`

The third example of both blocks shows a comparison checking for a non-empty value or existence. This test can also be omitted.

- `%paramDefault ? " = " value : ""%`
- `%paramDefault ? " = " value %`

All of the above examples containing `paramDefault` are equivalent. If the parameter in scope had a default value of **10**, the output from each of them would normally be:

`= 10`

Notes:

- In a conditional substitution macro, any white space following `<macroName>` is ignored; if white space is required in the output, it should be included within the quoted substitution strings

Tagged Value macros are a special form of field substitution macros, which provide access to element tags and the corresponding Tagged Values.

Use 1: Direct Substitution

This form of the macro directly substitutes the value of the named tag into the output.

Structure: `%<macroName>: " <tagName> " %`

`<macroName>` can be one of:

- `attTag`
- `classTag`
- `connectorDestElemTag`
- `connectorDestTag`
- `connectorSourceElemTag`

- connectorSourceTag
- connectorTag
- linkAttTag
- linkTag
- opTag
- packageTag
- paramTag

This corresponds to the tags for attributes, Classes, operations, packages, parameters, connectors with both ends, elements at both ends of connectors and connectors including the attribute end.

`<tagName>` is a string representing the specific tag name.

Examples:

```
%opTag: " attribute" %
```

Use 2: Conditional Substitution

This form of the macro mimics the conditional substitution defined for field substitution macros.

```
Structure: %<macroName>: "<tagName>" ( == "<test>" ) ? <subTrue> ( : <subFalse> ) %
```

Where:

- `<macroName>` and `<tagName>` are as defined above
- (`<text>`) denotes that `<text>` is optional
- `<test>` is a string representing a possible value for the macro
- `<sub True>` and `<sub False>` can be a combination of quoted strings and the keyword value. Where the value is used, it gets replaced with the macro's value in the output.

Examples:

```
%opTag: " opI nline" ? " i nline" : "" %
%opTag: " opI nline" ? " i nline" %
%cl assTag: " unsafe" == " true" ? " unsafe" : "" %
%cl assTag: " unsafe" == " true" ? " unsafe" %
```

Tagged Value macros use the same naming convention as field substitution macros.

Function macros are a convenient way of manipulating and formatting various element data. Each function macro returns a result string. There are two primary ways to use the results of function macros:

- Direct substitution of the returned string into the output, such as: `%TO_LOWER(attName)%`
- Storing the returned string as part of a variable definition such as: `$name = %TO_LOWER(attName)%`

Function macros can take parameters, which can be passed to the macros as:

- String literals, enclosed within double quotation marks
- Direct substitution macros without the enclosing percent signs
- Variable references
- Numeric literals.

Multiple parameters are passed using a comma-separated list.

Function macros are named according to the All-Caps style, as in: `%CONVERT_SCOPE(opScope)%`

The available function macros are described below. Parameters are denoted by angle brackets, as in: `FUNCTION_NAME(<param>)`.

CONVERT_SCOPE(<umIScope>)

For use with supported languages. Converts <umIScope> to the appropriate scope keyword for the language being generated. The following table shows the conversion of <umIScope> with respect to the given language.

Language	Package	Public	Private	Protected
C++	public	public	private	protected
C#	internal	public	private	protected
Delphi	protected	public	private	protected
Java		public	private	protected
PHP	public	public	private	protected
VB	Protected	Public	Private	Protected
VB .Net	Friend	Public	Private	Protected

COLLECTION_CLASS(<language>)

Gives the appropriate collection Class for the language specified for the current linked attribute.

CSTYLE_COMMENT(<wrap_length>)

Converts the notes for the element currently in scope to plain C-style comments, using /* and */.

DELPHI_PROPERTIES(<scope>, <separator>, <indent>)

Generates a Delphi property.

DELPHI_COMMENT(<wrap_length>)

Converts the notes for the element currently in scope to Delphi comments.

EXEC_ADD_IN(<addin_name>, <function_name>, <prm_1>, ..., <prm_n>)

Invokes an Enterprise Architect Add-In function, which can return a result string. <addin_name> and <function_name> specify the names of the Add-In and function to be invoked. Parameters to the Add-In function can be specified via parameters <prm_1> to <prm_n>. For example:

```
$result = %EXEC_ADD_IN( " MyAddin" , " ProcessOperation" , classGUID , opGUID ) %
```

Any function that is to be called by the *EXEC_ADD_IN* macro must have two parameters: an *EA.Repository* object, and a *Variant* array that contains any additional parameters from the *EXEC_ADD_IN* call. Return type should be *Variant*. For example:

```
Public Function ProcessOperation( Repository As EA.Repository , args As Variant ) As Variant
```

FIND(<src>, <subString>)

Position of the first instance of <subString> in <src>; -1 if none.

GET_ALIGNMENT()

Returns a string where all of the text on the current line of output is converted into spaces and tabs.

JAVADOC_COMMENT(<wrap_length>)

Converts the notes for the element currently in scope to *javadoc*-style comments.

LEFT(<src>, <count>)

The first <count> characters of <src>.

LENGTH(<src>)

Length of <src>.

MID(<src>, <count>)**MID(<src>, <start>, <count>)**

Substring of <src> starting at <start> and including <count> characters. Where <count> is omitted the rest of the string is included.

PI(<option>, <value>, ...)

Sets the PI for the current template to <value>. <option> controls when the new PI takes effect. Valid values are:

- *I, Immediate*: the new PI is generated before the next non-empty template line
- *N, Next*: the new PI is generated after the next non-empty template line.

Multiple pairs of options are allowed in one call. For more details, see the [description of PI](#).^[1135]

PROCESS_END_OBJECT(<template_name>)

Enables the Classes that are one Class further away from the base Class, to be transformed into objects (such as attributes, operations, packages, parameters and columns) of the base Class. <template_name> refers to the working template that temporarily stores the data.

REMOVE_DUPLICATES(<source>, <separator>)

Where <source> is a <separator> separated list; this removes any duplicate or empty strings.

REPLACE(<string>, <old>, <new>)

Replaces all occurrences of <old> with <new> in the given string <string>.

RESOLVE_OP_NAME()

Resolves clashes in interface names where two method-from interfaces have the same name.

RESOLVE_QUALIFIED_TYPE()**RESOLVE_QUALIFIED_TYPE(<separator>)****RESOLVE_QUALIFIED_TYPE(<separator>, <default>)**

Generates a qualified type for the current attribute, linked attribute, linked parent, operation, or parameter. Enables the specification of a separator other than . and a default value for when some value is required.

RIGHT(<src>, <count>)

The last <count> characters of <src>.

TO_LOWER(<string>)

Converts <string> to lower case.

TO_UPPER(<string>)

Converts <string> to upper case.

TRIM(<string>)**TRIM(<string>, <trimChars>)**

Removes trailing and leading white spaces from <string>. If <trimChars> is specified, all leading and trailing characters in the set of <trimChars> are removed.

TRIM_LEFT(<string>)**TRIM_LEFT(<string>, <trimChars>)**

Removes the specified leading characters from <string>.

TRIM_RIGHT(<string>)**TRIM_RIGHT(<string>, <trimChars>)**

Removes the specified trailing characters from <string>.

VB_COMMENT(<wrap_length>)

Converts the notes for the element currently in scope to Visual Basic style comments.

WRAP_COMMENT(<comment>, <wrap_length>, <indent>, <start_string>)

Wraps the text <comment> at width <wrap_length> putting <indent> and <start_string> at the beginning of each line. For example:

```
$behavior = %WRAP_COMMENT( opBehavior, "40", " ", "//" ) %
```

<wrap_length> must still be passed as a string, even though WRAP_COMMENT treats this parameter as an integer.

WRAP_LINES(<text>, <wrap_length>, <start_string>(, <end_string>))

Wraps <text> as designated to be <wrap_length>, adding <start_string> to the beginning of every line and <end_string> to the end of the line if it is specified.

XML_COMMENT(<wrap_length>)

Converts the notes for the element currently in scope to XML-style comments.

Control macros are used to control the processing and formatting of the templates. The basic types of control macro include:

- The *list* macro, for generating multiple element features, such as attributes and operations
- The branching macros, which form *if-then-else* constructs to conditionally execute parts of a template
- The PI macro, which takes effect from the next non-empty line
- A PI [function macro](#)^[1130] that enables setting PI to a variable and adds the ability to set the PI that is generated before the next line
- The PI macro for formatting new lines in the output
- The synchronization macros.

In general, control macros are named according to Camel casing.

List

The *list* macro is used to generate multiple elements. The basic structure is:

```
%list = <TemplateName> @separator = <string> @indent = <string> ( <conditions>
```

) %

where *<string>* is a double-quoted literal string and *<TemplateName>* can be one of the following template names:

- Attribute
- Class
- ClassBase
- ClassImpl
- ClassInterface
- Constraint
- Custom Template (custom templates enable you to define your own templates; for more information see [Custom Templates](#))^[1147].
- Effort
- InnerClass
- InnerClassImpl
- LinkedFile
- Metric
- Namespace
- Operation
- OperationImpl
- Parameter
- Problem
- Requirement
- Resource
- Risk
- Scenario
- Test

<conditions> is optional and appears the same as the conditions for *if* and *elseif* statements.

Example:

```
%d i st =" A t t r i b u t e" @separator="\n" @indent="  " %
```

The *separator* attribute, denoted above by *@separator*, specifies the space that should be used between the list items. This excludes the last item in the list.

The *indent* attribute, denoted by *@indent*, specifies the space by which each line in the generated output should be indented.

The above example would output the result of processing the *Attribute* template, for each attribute element of the Class in scope. The resultant list would separate its items with a single new line and indent them two spaces respectively. If the Class in scope had any stereotyped attributes, they would be generated using the appropriately specialized template.

There are some special cases to consider when using the *list* macro:

- If the *Attribute* template is used as an argument to the list macro, this also generates attributes derived from associations by executing the appropriate *LinkedAttribute* template
- If the *ClassBase* template is used as an argument to the list macro, this also generates Class bases derived from links in the model by executing the appropriate *LinkedClassBase* template
- If the *ClassInterface* template is used as an argument to the list macro, this also generates Class bases derived from links in the model by executing the appropriate *LinkedClassInterface* template
- If *InnerClass* or *InnerClassImpl* is used as an argument to the list macro, these Classes are generated using the *Class* and *ClassImpl* templates respectively. These arguments tell Enterprise Architect that it should process the templates based on the inner Classes of the Class in scope.

Branching (if-then-else Constructs)

The CTF supports a limited form of branching through the following macros:

- *if*
- *elseif*
- *endif*
- *endTemplate*

The basic structure of the *if* and *elseif* macros is:

```
%i f <test> <operator> <test>%
```

where *<operator>* can be one of:

- ==
- !=

and *<test>* can be one of:

- a string literal, enclosed within double quotation marks
- a direct substitution macro, without the enclosing percent signs
- a variable reference.

Branches can be nested, and multiple conditions can be specified using one of:

- and
- or.

When specifying multiple conditions, *and* and *or* have the same order of precedence, and conditions are processed left to right.

The *endif* or *endTemplate* macros must be used to signify the end of a branch. In addition, the *endTemplate* macro causes the template to return immediately, if the corresponding branch is being executed.

Example:

```
%i f elemType == "Interface" %
;
%e l s e %
%O p e r a t i o n B o d y %
%e n d I f %
```

Example:

```
$bases=%d i s t="ClassBase" @separator=", "%
$I n t e r f a c e s=%d i s t="ClassInterface" @separator=", "%
%i f $bases != "" and $i n t e r f a c e s != "" %
: $bases, $i n t e r f a c e s
%e l s e l f $bases != "" %
: $bases
%e l s e l f $i n t e r f a c e s != "" %
: $i n t e r f a c e s
%e n d I f %
```

The PI Macro

There are two primary means of generating whitespace from the templates:

- Explicitly using the *newline*, *space* and *tab* characters (**\n**, **\t**) as part of Literal Text
- Using the *PI* macro to format lines in the template that result in non-empty substitutions in the output.

By default, each template line that generates a non-empty substitution also results in a newline being produced in the output. This behavior can be changed through the *PI* macro.

To demonstrate the use of the *PI* macro, consider the default *C# Operation* template:

```
%o p T a g: " A t t r i b u t e " %
```

Default PI is \n, so any attributes would be on their

```

%PI = " " %
%opTag: " unsafe" == " true" ?
" unsafe" : "" %
%CONVERT_SCOPE( opScope) %
%opTag: " new" == " true" ? " new" :
"" %
%opAbstract == " T" ? " abstract" :
"" %
%opConst == " T" ? " sealed" : "" %
%opStatic == " T" ? " static" : "" %
%opTag: " extern" == " true" ?
" extern" : "" %
%opTag: " delegate" == " true" ?
" delegate" : "" %
%opTag: " override" == " true" ?
" override" : "" %
%opTag: " virtual" == " true" ?
" virtual" : "" %
%opRetur nType%%opRetur nAr ray == " T"
? "( )" : "" %
%opSt er eot ype == " oper at or" ?
" oper at or" : "" %
%opName%( %d i st = " Par amet er "
@separ at or = " , " %)

```

own line

Blank lines have no effect on the output

Set the PI, so keywords are separated by a space

Any keyword that does not apply - that is, the macro produces an empty result - does not result in a space

Only one space is generated for this line

The final line in the template does not generate a space

In the above example macros for the various keywords are to be arranged vertically for readability. In the output, however, each relevant keyword is to be separated by a single space. This is achieved by the line:

```
%PI = " " %
```

Notice how you do not specify the space between each of the possible keywords. This space is already implied by setting the PI to a single space. Essentially the PI acts as a convenience mechanism for formatting the output from within the templates.

The structure for setting the processing instruction is:

```
%PI =<value>%
```

where <value> can be a literal string enclosed by double quotes.

The following points apply to the *PI* macro:

- The value of the PI is not accessed explicitly
- Only template lines that result in a non-empty substitution cause the PI to be generated
- The last non-empty template line does not cause the PI to be generated
- The PI is not appended to the last substitution, regardless of which template line caused that substitution.

Synchronization Macros

The *synchronization macros* are used to provide formatting hints to Enterprise Architect when inserting new sections into the source code, during forward synchronization. The values for synchronization macros must be set in the **File** templates.

The structure for setting synchronization macros is:

```
%<name>=<value>%
```

where <name> can be one of the macros listed below and <value> is a literal string enclosed by double quotes.

Macro Name	Description
synchNewClassNotesSpace	Space to append to a new Class note. Default value: \ n .
synchNewAttributeNotesSpace	Space to append to a new attribute note. Default value: \ n .
synchNewOperationNotesSpace	Space to append to a new operation note. Default value: \ n .
synchNewOperationBodySpace	Space to append to a new operation body. Default value: \ n .
synchNamespaceBodyIndent	Indent applied to Classes within non-global namespaces. Default value: \ t .

Enterprise Architect provides two Enterprise Architect Simulation Library (EASL) code generation macros to generate code from behavioral models. These are:

- EASL_GET and
- EASLList.

EASL_GET

The *EASL_GET* macro is used to retrieve a property or a collection of an EASL object. The EASL objects and the properties and collections for each object are identified in the [EASL Collections](#)^[1138] and [EASL Properties](#)^[1147] topics.

Syntax

```
$result = %EASL_GET( <<Property>>, <<Owner ID>>, <<Name>> )
```

where:

- <<Property>> is either "Property" or "Collection"
- <<OwnerID>> is the ID of the owner object for which the property/collection is to be retrieved
- <<Name>> is the name of the property or Collection being accessed
- \$result is the returned value; this is "" if not a valid property.

Example

```
$sPr opName = %EASL_GET( " Pr ope r t y" , $c o n t e x t , " N a m e" ) %
```

EASLList

The *EASLList* macro is used to render each object in an EASL collection using the appropriate template.

Syntax

```
$result = %EASLList = <<Template Name>> @separator = <<Separator>>
@indent = <<indent>> @owner = <<OwnedID>>
@collection = <<Collection Name>> @option1 = <<OPTI ON1>>
@option2 = <<OPTI ON2>> . . . . . @optionN = <<OPTI ONN>> %
```

where:

- <<TemplateName>> is the name of any [behavioral model template](#)^[1138] or [custom template](#)^[1147]
- <<Separator>> is a list separator (such as "\n")
- <<indent>> is any indentation to be applied to the result
- <<owner>> is the ID of the object that contains the required collection
- <<CollectionName>> is the name of the required collection

- <<OPTION1>>....<<OPTION99>> are miscellaneous options that might be passed on the template; each option is given as an additional input parameter to the template
- \$result is the resultant value; this is "" if not a valid collection.

Example

```
$sStates = %EASLList="State" @separator="\n" @indent="\t"
           @owner=$StateMachineGUID @collection="States"
           @option=$sOption%
```

Behavioral Model Templates

- Action
- Action Assignment
- Action Break
- Action Call
- Action Create
- Action Destroy
- Action If
- Action Loop
- Action Opaque
- Action Parallel
- Action RaiseEvent
- Action RaiseException
- Action Switch
- Behavior
- Behavior Body
- Behavior Declaration
- Behavior Parameter
- Call Argument
- Guard
- Property Object
- Property Declaration
- Property Notes
- State
- State CallBack
- State Enumerate
- State EnumeratedName
- StateMachine
- StateMachine HistoryVar
- Transition
- Transition Effect
- Trigger.

This topic lists the EASL collections for each of the EASL objects, as retrieved by the [EASL_GET](#)^[1137] code generation macro.

Action

Collection Name	Description
Arguments	The Action's arguments.
SubActions	The sub-actions of the Action.

Behavior

Collection Name	Description
Actions	The Behavior's Actions.
Nodes	The Behavior's nodes.
Parameters	The Behavior's parameters.
Variables	The Behavior's variables.

Classifier

Collection Name	Description
AllStateMachines	All State Machines for the Classifier.
AsynchProperties	The asynchronous properties of the Classifier.
AsynchTriggers	The asynchronous triggers of the Classifier.
Behaviors	The behaviors of the Classifier.
Properties	The properties of the Classifier.
TimedProperties	The timed properties of the Classifier.
TimedTriggers	The timed triggers of the Classifier.
Triggers	All triggers of the Classifier.

Construct

Collection Name	Description
AllChildren	The Construct's children.
ClientDependencies	The client dependencies on the Construct.
StereoTypes	The stereotypes of the Construct.
SupplierDependencies	The supplier dependencies on the Construct.

Node

Collection Name	Description
IncomingEdges	The Node's incoming edges.
OutgoingEdges	The Node's outgoing edges.
SubNodes	The sub-nodes of the Node.

State

Collection Name	Description
DoBehaviors	The State's Do behaviors.
EntryBehaviors	The State's Entry behaviors.
ExitBehaviors	The State's Exit behaviors.

StateMachine

Collection Name	Description
AllFinalStates	The State Machine's final States.
AllStates	All States within the State Machine, including those within Submachine States.
DerivedTransitions	The State Machine's derived transitions with the associated valid effect.
States	The States within the State Machine.
Transitions	The transitions within the State Machine.
Vertices	The State Machine's vertices.

Transition

Collection Name	Description
Effects	The Transition's effects.
Guards	The Transition's guards.
Triggers	The Transition's triggers.

Trigger

Collection Name	Description
TriggeredTransitions	The triggered transitions associated with the Trigger.

Vertex

Collection Name	Description
DerivedOutgoingTransitions	The Vertex's derived outgoing transitions after traversing the pseudo-nodes.
IncomingTransitions	The Vertex's incoming transitions.

Collection Name	Description
OutgoingTransitions	The Vertex's outgoing transitions.

This topic lists the EASL properties for each of the EASL objects, as retrieved by the [EASL_GET](#)^[1137] code generation macro.

Action

Property Name	Description
Behavior	The Action's associated behavior (<i>Call Behavior Action</i> or <i>Call Operation Action</i>).
Body	The Action's body.
Context	The Action's context.
Guard	The Action's guard.
IsFinal	A check on whether the action is a final Action.
IsGuarded	A check on whether the action is a guarded Action.
IsInitial	A check on whether the action is an initial Action.
Kind	The Action's kind.
Next	The Action's next action.
Node	The Action's associated node in the graph.

Argument

Property Name	Description
Parameter	The ID of the Argument's associated parameter.
Value	The default value of the argument.

Behavior

Property Name	Description
InitialAction	The Behavior's initial action.
isReadOnly	The isReadOnly of the Behavior.
isSingleExecution	The isSingleExecution of the Behavior.
Kind	The kind of Behavior.
ReturnType	The return type of the Behavior.
Specification	The specification of the Behavior.

CallEvent

Property Name	Description
Operation	The operation of the CallEvent.

ChangeEvent

Property Name	Description
ChangeExpression	The change expression of the ChangeEvent.

Classifier

Property Name	Description
HasBehaviors	A check on whether the Classifier has behavioral models (Activity and Interaction).
Language	The Classifier's language.
StateMachine	The State Machine of the Classifier.

Condition

Property Name	Description
Expression	The Condition's expression.
Lower	The Condition's lower value.
Upper	The Condition's upper value.

Construct

Property Name	Description
GetTaggedValue	The Property's Tagged Value.
IsStereotypeApplied	A check on whether a particular stereotype is applied to the Property.
Notes	Notes on the Property.
UMLType	The UML type of the Property.
Visibility	The visibility of the Property.

Edge

Property Name	Description
From	The ID of the node from which the Edge arises.
To	The ID of the node at which the Edge is targeted.

EventObject

Property Name	Description
EventKind	The event kind of the Event Object.

Instance

Property Name	Description
Classifier	The classifier of the Instance.
Value	The value of the Instance.

Parameter

Property Name	Description
Direction	The direction of the Parameter.
Type	The type of the Parameter.
Value	The value of the parameter.

Primitive

Property Name	Description
FQName	The FQ name of the Primitive.
ID	The ID of the Primitive.
Name	The name of the Primitive.
ObjectType	The object type of the Primitive.
Parent	The IDParent of the Primitive.

PropertyObject

Property Name	Description
BoundSize	The bound size of the PropertyObject (if it is a collection).

Property Name	Description
ClassifierStereoType	The stereotype of the PropertyObject's classifier.
IsAsynchProp	A check on whether the PropertyObject is an asynchronous property.
IsCollection	A check on whether the PropertyObject is a collection.
IsOrdered	A check on whether the PropertyObject is ordered (if it is a collection).
IsTimedProp	A check on whether the PropertyObject is a timed property.
Kind	The PropertyObject's kind.
LowerValue	The PropertyObject's lower value (if it is a collection).
Type	The PropertyObject's type.
UpperValue	The PropertyObject's upper value (if it is a collection).
Value	The PropertyObject's value.

SignalEvent

Property Name	Description
Signal	The signal of the SignalEvent.

State

Property Name	Description
HasSubMachine	A check on whether the State is a Submachine state.
IsFinalState	A check on whether the State is a final state.
SubMachine	Get the ID of the Submachine contained by the State (if applicable).

StateMachine

Property Name	Description
HasSubMachineState	A check on whether the State Machine has a Submachine state.
InitialState	The State Machine's initial state.
SubMachineState	The State Machine's Submachine state.

TimeEvent

Property Name	Description
When	The 'when' property of the TimeEvent.

Transition

Property Name	Description
HasEffect	A check on whether the transition has a valid effect.
IsDerived	A check on whether the transition is a derived transition.
IsTranscend	A check on whether the transition transcends from one State Machine (Submachine state) to another.
IsTriggered	A check on whether the transition is triggered.
Source	The Transition's source.
Target	The Transition's target.

Trigger

Property Name	Description
AsynchDestinationState	The asynchronous destination state of the Trigger (if it is an asynchronous trigger).
DependentProperty	The ID of the property associated with the Trigger.
Event	The Trigger's event.
Name	The Trigger's name.
Type	The Trigger's type.

Vertex

Property Name	Description
IsHistory	A check on whether the vertex is a history state.
IsPseudoState	A check on whether the vertex is a pseudo state.
PseudoStateKind	The Vertex's pseudo-state kind.

6.10.1.5.1.3 Variables

Template variables provide a convenient way of storing and retrieving data within a template. This section explains how variables are defined and referenced.

Variable Definitions

Variable definitions take the basic form:

```
$<name> = <value>
```

where *<name>* can be any alpha-numeric sequence and *<value>* is derived from a macro or another variable.

A simple example definition would be:

```
$foo = %className%
```

Variables can be defined, using values from:

- Substitution, function or list macros
- String literals, enclosed within double quotation marks
- Variable references.

Definition Rules

The following rules apply to variable definitions:

- Variables have global scope within the template in which they are defined and are not accessible to other templates
- Each variable must be defined at the start of a line, without any intervening whitespace
- Variables are denoted by prefixing the name with \$, as in \$foo
- Variables do not have to be declared, prior to being defined
- Variables must be defined using either the assignment operator (=), or the addition-assignment operator (+=)
- Multiple terms can be combined in a single definition using the addition operator (+).

Examples

Using a substitution macro:

```
$foo = %opTag: " bar " %
```

Using a literal string:

```
$foo = " bar "
```

Using another variable:

```
$foo = $bar
```

Using a list macro:

```
$ops = %list=" Operation" @separator="\n\n" @indent="\t" %
```

Using the addition-assignment operator (+=):

```
$body += %list=" Operation" @separator="\n\n" @indent="\t" %
```

The above definition is equivalent to the following:

```
$body = $body + %list=" Operation" @separator="\n\n" @indent="\t" %
```

Using multiple terms:

```
$templateArgs = %list=" ClassParameter" @separator=", " %
$template = "template<" + $templateArgs + ">"
```

Variable References

Variable values can be retrieved by using a reference of the form:

```
$<name>
```

where <name> can be a previously defined variable.

Variable references can be used in one of the following ways:

- As part of a macro, such as the argument to a function macro
- As a term in a variable definition
- As a direct substitution of the variable value into the output.

It is legal to reference a variable before it is defined. In this case, the variable is assumed to contain an empty string value: ""

Example 1

Using variables as part of a macro. The following is an excerpt from the default C++ ClassNotes template.

<code>\$wrapLen = %genOpt WrapComment %</code>	Define variables to store the style and wrap length options.
<code>\$style = %</code>	
<code>genOpt CPPComment Style%</code>	
<code>%if \$style == "XML.NET" %</code>	Reference to <i>\$style</i> as part of a condition.
<code>%XML_COMMENT(\$wrapLen) %</code>	
<code>%else%</code>	
<code>%CSTYLE_COMMENT(\$wrapLen) %</code>	Reference to <i>\$wrapLen</i> as an argument to function macro.
<code>%endif %</code>	

Example 2

Using variable references as part of a variable definitions:

<code>\$foo = "foo"</code>	Define our variables.
<code>\$bar = "bar"</code>	
<code>\$foobar = \$foo + \$bar</code>	<i>\$foobar</i> now contains the value <i>foobar</i> .

Example 3

Substituting variable values into the output

<code>\$bases=%classInherits%</code>	Store the result of the <i>ClassInherits</i> template in <i>\$bases</i> .
<code>Class %className%\$bases</code>	Now output the value of <i>\$bases</i> after the Class name.

6.10.1.5.2 The Code Template Editor in MDG Development

The following topics describe how you use the Code Template Editor window to create custom templates:

- [Custom Templates](#) ^[1147]
- [Override Default Templates](#) ^[1148]
- [Add New Stereotyped Templates](#) ^[1149]
- [Create Templates For Custom Languages](#) ^[1150]

The Code Template Editor provides the facilities of the **Common Code Editor**, including intellisense for the code generation template macros. For more information on intellisense and the Common Code Editor, see the Code Editors topic.

Learn More:

- [Code Generation Template Macros](#) ^[1151]
- [Code Editors](#) ^[1394]

6.10.1.5.2.1 Custom Templates

Custom templates enable you to generate an element in many different ways. Enterprise Architect enables you to define custom templates that are associated with given elements and call these templates from existing templates. You can even add stereotype overrides to your custom templates. For example, you might list all of your parameters and their notes in your method notes.

To create a new custom template, follow the steps below:

Step	Description	See Also
1	Select the Settings Code Generation Templates menu option, or press (Ctrl+Shift+P). The Code Templates Editor tab opens.	
2	In the Language field, click on the drop-down arrow and select the appropriate language.	
3	Click on the Add New Custom Template button. The Create New Custom Template dialog displays.	
4	<p>In the Template Type field, click on the drop-down arrow and select the appropriate element. The elements currently supported are:</p> <ul style="list-style-type: none"> • Attribute • Class • Class Base • Class Interface • Class Parameter • Connector • Import • Linked Attribute • Linked Class Base • Linked Class Interface • Namespace • Operation • Parameter <p><None> requires special treatment. It enables the definition of a function macro that doesn't actually apply to any of the types, but must be called as a function to define variables \$parameter1, \$parameter2 and so on for each value passed in.</p>	
5	In the Template Name field, type an appropriate name, then click on the OK button.	
6	On the Code Templates Editor tab, the new template displays in the Templates list with the value Yes in the Modified field. The template is called <Template Type>_<Template Name>.	
7	Select the appropriate template from the Templates list and edit the contents in the Template field to meet your requirements.	
8	Click on the Save button. This stores the new stereotyped template in the .EAP file. The template is now available from the list of templates and via direct substitution for use.	

6.10.1.5.2.2 Override Default Templates

Enterprise Architect has a set of built-in or default code generation templates. The **Code Templates Editor** enables you to modify these default templates, hence customizing the way in which Enterprise Architect generates code. You can choose to modify any or all of the base templates to achieve your required coding style.

Any templates that you have overridden are stored in the .EAP file. When generating code, Enterprise Architect first checks whether a template has been modified and if so, uses that template. Otherwise the appropriate default template is used.

To override a default code generation template, follow the steps below

Step	Description	See Also
1	Select the Configuration Code Generation Templates menu option. The Code Templates Editor displays.	
2	Select the appropriate language from the Language list.	
3	Select one of the base templates from the Templates list.	
4	If the base template has stereotyped overrides, you can select one of these from the Stereotype Overrides list.	
5	In the Code Templates Editor , make the required modifications.	
6	Click on the Save button. This stores the modified version of the template to the .EAP file. The template is marked as modified.	

When generating code, Enterprise Architect now uses the overridden template, instead of the default template.

6.10.1.5.2.3 Add New Stereotyped Templates

Sometimes it is useful to define a specific code generation template for use with elements of a given stereotype. This enables different code to be generated for elements, depending on their stereotype. Enterprise Architect provides some default templates, which have been specialized for commonly used stereotypes in supported languages. For example the Operation Body template for C# has been specialized for the *property* stereotype, so that it automatically generates its constituent *get* and *set* methods. Users can override the default stereotyped templates as described in the previous topic. Additionally users can define templates for their own stereotypes, as described below.

To add a new stereotyped template, follow the steps below:

Step	Description	See Also
1	Select the Configuration Code Generation Templates menu option to open the Code Templates Editor .	
2	Select the appropriate language, from the Language list.	
3	Select one of the base templates, from the Templates list.	
4	Click on the Add New Stereotyped Override button. The New Template Override dialog displays.	
5	Select the required Feature and/or Class stereotype and click on the OK button.	
6	The new stereotyped template override displays in Stereotype Overrides list, marked as modified.	
7	Make the required modifications in the Code Templates Editor .	
8	Click on the Save button. This stores the new stereotyped template in the .EAP file.	

Enterprise Architect can now use the stereotyped template, when generating code for elements of that stereotype.

Note that Class and feature stereotypes can be combined to provide a further level of specialization for features. For example, if properties should be generated differently when the Class has a stereotype

MyStereotype, then both *property* and *MyStereotype* should be specified in the **New Template Override** dialog.

6.10.1.5.2.4 Create Custom Language Template

Enterprise Architect can forward generate code for languages that it does not specifically support, if the appropriate code generation templates are defined for that language. This topic outlines the steps required to define templates for custom languages.

To define a template for a custom language, follow the steps below

Step	Description	See Also
1	Create the custom language as a new product. To do this: <ul style="list-style-type: none"> Select the Settings Code Datatypes menu option. The Programming Languages Datatypes dialog displays. In the Product Name field type the name of the new language, and in the Datatype field type a datatype (one is enough to declare that the new language exists). 	Data Types 777
2	Select the Settings Code Generation Templates menu option. The Code Templates Editor view displays.	
3	In the Language field, click on the drop-down arrow and select the custom language.	
4	From the Templates list, select one of the base templates.	
5	Define the template using the Code Templates Editor .	
6	Click on the Save button. This stores the template in the .EAP file.	
7	Repeat steps 1 to 6 for each of the relevant base templates for the custom language.	

Notes:

- The File template must be defined for the custom language. The File template can then see the Import Section, Namespace and Class templates

Part

7 Requirement Models

Topics:

Topic	Detail	See also
Introduction	<p>This section describes the Enterprise Architect Requirements Management facilities, and discusses:</p> <ul style="list-style-type: none"> • What requirements are • How requirements are generated and organized • How Enterprise Architect supports and simplifies Requirements Management 	White Paper (Requirements Management with Enterprise Architect)
What is a Requirement?	<p>Requirements are essentially what the system, application or business process <i>is required</i> to do</p> <p>A requirement can be:</p> <ul style="list-style-type: none"> • Broad and high level, defining - for example - that a process is necessary to update a particular database • More specialized and detailed, recording the expectation that - for example - a system call must always be acknowledged by return <p>Detailed requirements can be organized into a hierarchy culminating in a high-level requirement, so that satisfying each of the detailed requirements results in meeting the higher-level requirements and ultimately the top-level requirement</p> <p>This hierarchical structure helps manage the complexity of large systems with thousands of requirements and many processes being developed to implement the requirements</p>	
Gathering Requirements	<p>Gathering requirements is typically the first step in developing a solution, be it for developing a system or a process. Requirements are gathered from all parties expected to use, maintain or benefit from the solution, and are organized into groups, functional areas and hierarchies as necessary. They can be transcribed into a spreadsheet or a requirements gathering or management tool, or they can be created in an integrated modeling tool such as Enterprise Architect.</p>	
Requirements Management and Enterprise Architect	<p>The management of requirements is one of the more problematic disciplines in software development, for reasons such as:</p> <ul style="list-style-type: none"> • Diverse group input into the requirements • Organizational boundary divisions • Tool boundary divisions • Volatility of requirements • Imprecision and ambiguity in natural languages <p>These can cause issues with:</p> <ul style="list-style-type: none"> • Traceability and • Integration with change and configuration management systems <p>Enterprise Architect can reduce or eliminate these</p>	Create Requirements ^[1156] View Requirements ^[1170] Import Requirements Using CSV ^[1162] Model Requirements ^[1165] Requirement Properties ^[1157] Extend Requirement Properties ^[1160] Trace Use Of Requirements ^[1170] Relationship Matrix ^[496]

Topic	Detail	See also
	<p>problems in Requirements Management; it is one of the few UML tools that integrate Requirements Management with other software development disciplines in the core product, by defining requirements within the model. Within Enterprise Architect, you can:</p> <ul style="list-style-type: none"> • Create and view requirements as entities and properties directly in the model • Collate the requirements in an external CSV file and then import them into your model • Detail use cases and scenarios directly in the model • Enter standard attributes (properties) for each requirement, such as difficulty, status and type, and define your own attributes (properties) • Trace requirements to Use Cases, business rules, test cases and analysis artifacts (using, for example, the Relationship Matrix) • Trace and view the impact of changes on requirements (through, for example, the Traceability window) and review the changes themselves • Create customer-quality MS Word and HTML reports on requirements 	<p>Traceability Window^[495]</p> <p>Manage Requirement Changes^[1171]</p> <p>Report on Requirements^[1173]</p>

Notes:

- All of these features are illustrated by examples in the EAExample.eap model, provided as part of your Enterprise Architect installation in the Enterprise Architect Program Files directory:

..\Program Files\Sparx Systems\EA

7.1 Requirements

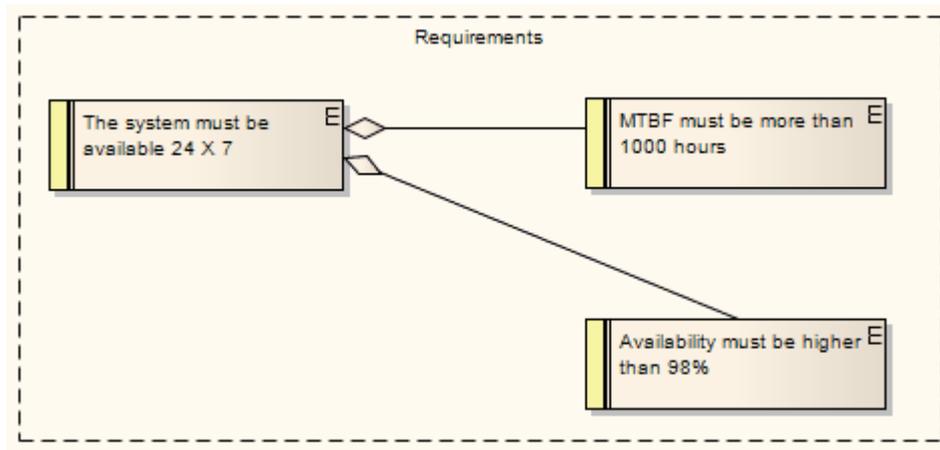

Description

As an analysis step, often it is desirable to capture simple system requirements. These are eventually realized by Use Cases.

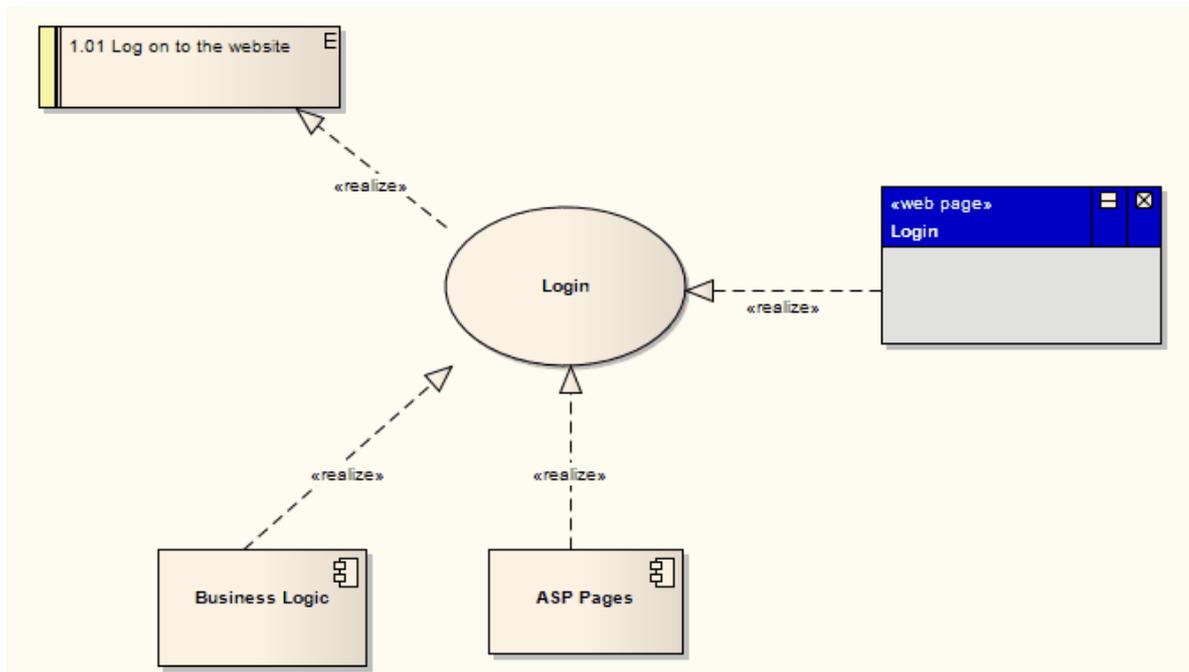

In the initial requirement gathering phase, cataloging requirements can be achieved using the Requirement extension on a Custom diagram.

Examples

Requirements can be aggregated to create a hierarchy. The diagram below illustrates how this might be done.

In the following diagram, a requirement that a user can log into a website is implemented by the *Login* Use Case, which in turn is implemented by the *Business Logic*, *ASP Pages* and *Login Web Page*. Using this approach, you can easily model quite detailed and complex dependencies and implementation relationships.

Notes:

- External requirements can be displayed with or without an identifying **E** (for External) in the top right corner of the element. To toggle the display of this letter, select or deselect the **Show stereotype icon for requirements** checkbox on the **Options** dialog, **Objects** page.
- The colors on Requirement elements identify the status of the requirement. You change the status - and hence color - on the element **Properties** dialog. You set the color for each status on the **Status Types** dialog.

Toolbox Icon

7.2 Create Requirements

Topics:

Topic	Detail	See also
Usage	<p>Within Enterprise Architect you can create external Requirement elements in a number of ways, such as:</p> <ul style="list-style-type: none"> • Dragging a <i>Requirement</i> icon from the Toolbox into a specific diagram (which also adds the Requirement to the diagram's parent package - see below) • Dragging text from a text file onto a diagram, to generate a requirement based on that text - see below • Generating an element within a specific package in the Project Browser - see below • Importing requirements from a spreadsheet application such as Excel, via CSV • Creating Requirement elements on the Package Browser or Diagram List for the selected package or diagram • Converting an internal responsibility into an external element, in a selected target package • Importing requirements from another requirements management tool, such as Telelogic DOORS (in this case via the Sparx Systems MDG Link For DOORS integration tool) 	<p>Import Requirements using CSV^[1162]</p> <p>Package Browser^[456]</p> <p>Diagram List^[462]</p> <p>Converting an Internal Responsibility^[1167]</p> <p>Sparx Systems MDG Link For DOORS</p>

How To:

To create Requirement elements in a diagram, follow the steps below:

Step	Action	See Also
1	Open the Custom pages on the Toolbox	Custom Group ^[562]
2	Drag the <i>Requirement</i> element onto the current diagram	
3	Enter the Name and other details for the requirement Enterprise Architect creates a Requirement element in the current diagram and in the diagram's parent package	Requirement Properties ^[1157]

Alternatively:

(The following procedure converts a text section heading into an element name and the section text into the element's Notes text. You can use this procedure to generate elements of a *range* of types; however, it is particularly useful for generating Requirements from a requirements specification document.)

Step	Action	See Also
1	Open an Enterprise Architect diagram in the Diagram View	
2	Open the required document file containing the text you want to generate Requirement elements from (this can be opened in any common text editing	

Step	Action	See Also
	tool)	
3	Highlight the required heading and associated text and drag them from the text file into the diagram The Toolbox Shortcut menu displays	Toolbox Shortcut Menu ^[55]
4	Navigate through the menus and select the required element type (in this case, click on Common and Requirement)	
5	Enterprise Architect creates a (Requirement) element in the diagram, and displays the Properties dialog with the section heading in the Name (or equivalent) field and the text in the Notes field; the element is also added to the diagram's parent package	

To create a requirement directly in the Project Browser, follow the steps below

Step	Action	See Also
1	Right-click on the required parent package to open the context menu	
2	Select the Insert New Element menu option; alternatively, press (Ctrl+M)	
3	In the New Element dialog select the Requirement type	
4	Enter the Name (or select Auto) and click on the OK button Enterprise Architect creates a requirement in the current package	

Notes:

- The Requirement element name can be simply descriptive text, with or without a manually-typed reference number; however, as requirements often have to have a unique reference for external checking, you can use the Enterprise Architect auto-numbering facility to automatically apply a numbering system with or without prefixes and suffixes - set the element type to **Requirement**
- External Requirement elements can be displayed with or without an identifying **E** in the top right corner; to toggle display of this letter, select or deselect the **Show stereotype icon for requirements** checkbox on the Options dialog, Objects page
- Requirement elements can be color coded to indicate their status

Learn More:

- [Auto Naming and Auto Counters](#) ^[628]
- [Objects](#) ^[432]
- [Color Code External Requirements](#) ^[1159]

7.2.1 Requirement Properties

Requirement properties differ slightly from the properties of other elements; they include information related to the Type, Status, Difficulty and Priority of the Requirement. The **Notes** field is also important, as it describes precisely what requirement the element represents. Requirement naming can also require careful consideration and could reflect either a categorical naming convention, or simply a loose English description of the Requirement.

Access: [Requirement Element Context Menu | Properties](#)

Use to:

- Document requirements
- Set Requirement features such as Type, Status and Priority
- Set other element properties common to both Requirements and other model Elements

Reference:

Field	Usage	See Also
Short Description	The name of this requirement, which could include numbering, plain English description or some other formal specification	
Alias	An alias to be used for this requirement	Auto Counters ^[628]
Status	The current status of this requirement	Color Code Requirements ^[1159]
Difficulty	An estimate of the difficulty in meeting this requirement. Enterprise Architect supports the values 'Low', 'Medium', 'High'	
Priority	The relative importance of meeting this requirement compared to other requirements; select from: <ul style="list-style-type: none"> • Low • Medium • High 	
Author	The author of this requirement	Authors ^[778]
Key Words	A set of words that could be used to index or define the subject of this requirement	
Type	The type of this requirement. This is typically used as a category for the requirement.	Requirement Types ^[785]
Phase	The phase of this requirement.	
Version	The version of this requirement.	
Last Update	Read-only field specifying when this requirement was last changed.	
Created	Read-only field specifying when this requirement was first created.	
Notes	The description of this requirement.	Note Editors ^[769] , Linked Documents ^[729]

Notes:

- In Requirement Management tools and texts, the characteristics of a requirement are commonly called attributes. However, in UML the term attribute refers to a different type of feature, and the requirement characteristics are defined as properties. In this Enterprise Architect documentation, the term

properties is used

- In a project, it might be necessary to define more information in a requirement than is provided by the standard properties. For more information on extending the requirement properties, see the Extend Requirement Properties topic

Learn More

- [Extend Requirement Properties](#) ^[1160]

7.2.2 Color Code External Requirements

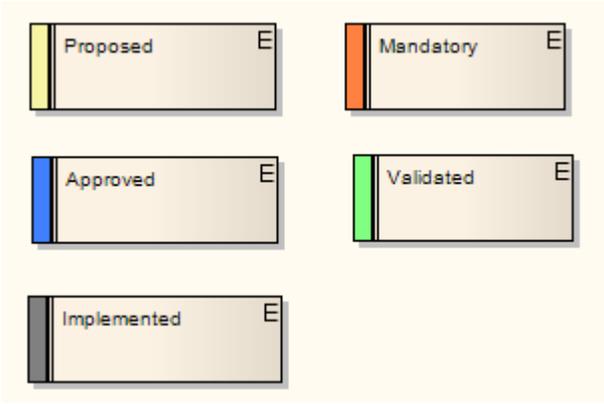

External requirements can be color coded to provide quick visual cues indicating the status of a requirement.

How to:

To enable color coded external requirements follow the steps below

Step	Action
1	Select the Tools Options menu option The Options dialog displays
2	From the hierarchical tree select Objects, and select the Show status colors on diagrams checkbox to enable the status of external requirements to be represented by color coding

Topics:

Topic	Detail	See also
Usage	<p>The color code requirements use the following default conventions:</p> <ul style="list-style-type: none"> • Yellow for Proposed • Blue for Approved • Green for Validated • Orange for Mandatory • Black for Implemented  <p>You can change these colors, and add or remove status types, using the Status Types dialog</p>	<p>Status Types Dialog ^[783]</p>

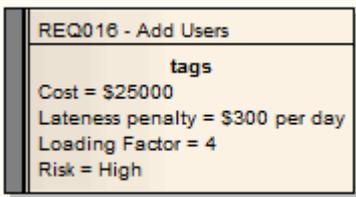

7.2.3 Extend Requirement Properties

Topics:

Topic	Detail	See also
Introduction	<p>A project might apply further properties to a requirement, such as cost, lateness penalty or risk to the business if not met. You can add these properties to specific Requirement elements, or configure them to be automatically available in all Requirement elements on creation, using Tagged Values. (These are sometimes referred to as User-defined attributes.)</p> <p>Extended element properties are not visible unless you open the Tagged Values window for the element. Alternatively, you can display the additional properties on the element image on its diagrams.</p>	<p>Tagged Values ^[762]</p> <p>Display Tagged Values on Diagrams ^[1167]</p>
Add Tagged Values to Existing Requirements	<p>To add a property to a single Requirement as a Tagged Value, simply click on the Requirement, display the Tagged Values window (Ctrl+Shift+6), and enter the name of the property as the tag name and the value of the property as the tag value.</p> <p>It is likely that any property you add to one Requirement would also apply to others. You might therefore use a predefined Tagged Value Type to identify your Requirement property, so that you can select it whenever required. The predefined Tagged Value Type also enables you to define specific values for the Tagged Value. If the appropriate predefined Tagged Value Type does not exist, a Technology Developer can create it to add to the structured tags, reference tags, or customized tags collections.</p>	<p>Assign a Tagged Value to an Item ^[764]</p> <p>Create Structured Tagged Values ^[1117]</p> <p>Create Reference Date Tagged Values ^[1113]</p> <p>Create a Custom Tagged Value Type ^[1113]</p>
Configure Requirements to be Created With Extended Properties	<p>If it is necessary to create all Requirements with the same extended set of properties, you can create a Requirement Template diagram and either create a special Requirement that defines those properties (as Tagged Values), or drag an existing Requirement with those properties onto the diagram. You then set the Requirement Template diagram as the template for all new Requirement elements, so that those new Requirements automatically have all of the properties you want.</p> <p>However, this then excludes other Requirement element formats, including the standard Requirement format. If you want to use another Requirement format, you have to replace or cancel the current Template. Alternatively, you can create a Profile.</p> <p>A Profile also defines exactly what a new Requirement element should contain, and how it should display in diagrams. However, a Profile is a collection of alternative element definitions, so it does not override the default Requirement format, nor does it prevent you from defining several different types of Requirement element. You can therefore have separate and parallel definitions of elements for business requirements, system requirements, project requirements, or any other category of requirement you decide to work with.</p> <p>For information on importing and using existing Profile files, see the UML Profiles topic. For information on creating new Profiles, see the Developing Profiles topic.</p>	<p>Set Element Template Package ^[643]</p> <p>UML Profiles ^[1026]</p> <p>Developing Profiles ^[1039]</p>

7.2.4 Display Tagged Values On Diagrams

Topics:

Topic	Detail	See also
Usage	<p>If you have extended the properties of a Requirement, you might want to make those properties visible in the Requirement elements in your diagrams, by switching on display of the element tags compartment. You can do this in one of two ways:</p> <ul style="list-style-type: none"> To display the <i>tags</i> compartment on all elements on a diagram, double-click on the diagram background and select the Elements tab of the Diagram Properties dialog; select the Tags checkbox and click on the OK button To display the <i>tags</i> compartment on a specific element on a diagram, right-click on the element and select the Feature Visibility context menu option; select the Tags checkbox in the Show Element Compartments panel of the Feature Visibility dialog, and click on the OK button <p>The Tagged Values are then displayed in the Requirement element on the diagram.</p> 	

Learn More:

- [Elements](#)^[573]
- [Feature Visibility](#)^[585]

7.2.5 Connect Requirements

Topics:

Topic	Detail	See also
Abstract	<p>A Requirement element can be connected to other Requirements, most commonly using Aggregate relationships to form a hierarchy of requirements.</p> <p>Requirements are also connected to other types of element, most commonly Use Cases, by Realize or Implements relationships.</p> <p>These relationships are very important, both in identifying how the Requirements are organized and used in the model, and in tracing the development from the Requirements throughout the model. Both of these tasks are very simple in Enterprise Architect, because once a connector on a Requirement exists, Enterprise Architect automatically lists the Requirement in the:</p>	<p>Aggregate relationships^[968]</p> <p>Realization^[1007]</p> <p>Trace Requirements^[1170]</p> <p>Traceability^[495]</p> <p>Requirements^[664]</p> <p>Requirement</p>

Topic	Detail	See also
	<ul style="list-style-type: none"> Requirements Traceability window (an important tool in examining the role of Requirements in the model) Requirements tab of the target element Properties dialog Links tab of the Requirement element Properties dialog Scenarios & Requirements window Relationships Window Dependency and Implementation reports Standard RTF output <p>The connector itself is also listed in the Links tab of the target element Properties dialog, and in the Relationship Matrix. There are, therefore, many ways to locate, view and track Requirement relationships.</p>	Properties ^[1157] Scenarios & Requirements ^[689] Relationships Window ^[504] Dependency ^[1783] Implementation reports ^[1785] Standard RTF output ^[1726] Links ^[666] Relationship Matrix ^[496]
Connect On Diagram	<p>Relationships can be created on a diagram by clicking on the appropriate connector icon from the Requirement and Common pages of the Toolbox, clicking on the source (originating) element, and dragging to the target element.</p> <p>If you are connecting elements in different packages, you can drag elements from the Project Browser onto a common diagram and set up the relationships there. Alternatively, you can quickly generate a Realize connector by dragging an existing Requirement element from the Project Browser over the element that implements the Requirement. Enterprise Architect interprets this as a request to create the Realize connector and does so automatically. The Requirement element is not added to the diagram. However, if you subsequently drag the Requirement onto the diagram the connector is already in place.</p>	Requirement Group ^[563] Common Group ^[552]
Connect Off Diagram	<p>You can also connect a Requirement element to other elements without necessarily having the elements on the same diagram, or having a diagram open.</p> <p>Use the Relationship Matrix to create relationships for requirements; this is a convenient way of quickly building up complex relationships and hierarchies.</p>	Creating Relationships ^[500]

7.2.6 Import Requirements and Hierarchies in CSV

Topics:

Topic	Detail	See also
Usage	<p>You can import Requirements from a spreadsheet application in CSV format. Before doing this you must create a CSV import file specification that:</p> <ul style="list-style-type: none"> In the Default Types field has the value requirement,package to import requirements and a package structure to contain them Has the Preserve Hierarchy checkbox selected Identifies the data fields on the spreadsheet that are to be 	

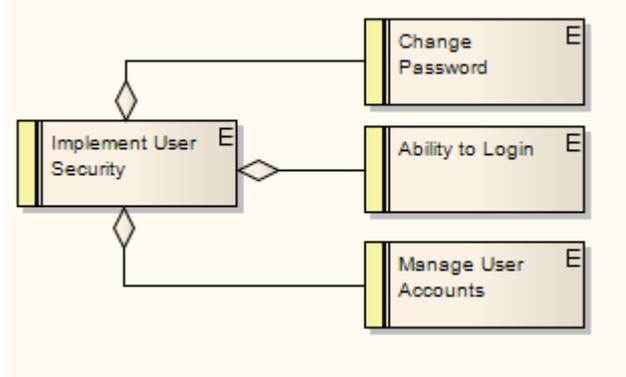

Topic	Detail	See also
	<p>translated into Enterprise Architect, in the order in which they are plotted across the spreadsheet</p> <ul style="list-style-type: none">• Is to operate on a spreadsheet containing the CSV_KEY and CSV_PARENT_KEY fields (which, if not generated by a CSV export from Enterprise Architect, you have added and populated yourself) <p>This enables you to import the individual and grouped requirements from the spreadsheet into Enterprise Architect, and to reconstruct the hierarchies of Requirements in the target package in the Project Browser.</p>

7.3 Model Requirements

Topics:

Topic	Detail	See also
Represent Requirements	<p>In Enterprise Architect, a requirement can be modeled as an:</p> <ul style="list-style-type: none"> • External Requirement - an expectation of the system or process, what the system or process must provide, modeled as an element; for example, a business requirement or a stakeholder request - Requirements at this level have their own properties and are reported on separately in RTF reports • Internal requirement – a responsibility of an existing element, what the element must do or accomplish, defined as a property of the element <p>Requirements Management in Enterprise Architect is primarily concerned with external Requirement elements and the elements that implement or realize them.</p>	Requirements <small>[1154]</small> Internal requirements <small>[1167]</small>
Requirements in the Model	<p>Requirement elements can be grouped and organized within Requirements diagrams. The Requirement elements are connected to each other by <i>Aggregate</i> relationships to form a hierarchy:</p>  <p>It is quite usual to develop a package of many hundreds of Requirement elements, arranged individually and in hierarchies of varying complexity. In the Project Browser you can use the Turn On Level Numbering facility to highlight the order and arrangement of the Requirements quickly and easily. The following illustration shows a number of Requirements in a package, where Level Numbering makes the order and arrangement clear:</p>	Requirements Diagram <small>[1174]</small> Turn On Level Numbering <small>[444]</small> RTF Style Template Editor <small>[1736]</small>

Topic	Detail	See also
	 <p>If elements are added, moved or deleted from the package, the numbering automatically adjusts.</p> <p>This numbering can also be applied in the RTF report generator using the LevelNumber field in the Element section – {Element.LevelNumber}.</p>	
<p>Use Cases</p>	<p>Requirements are implemented (realized) by model elements such as Use Cases, Classes, Interfaces and Components. There are many ways to trace either the Requirement for the feature or service modeled by the elements, or the elements that develop the requirement, most visibly in Traceability diagrams that depict the Requirements and the model elements connected by Realize relationships. The Realize connector enables members of the project team to keep design objectives and development in tandem, and the development path and purpose clear.</p>  <p>The more usual realization relationship is between a Requirement and a Use Case. A Requirement can be realized by one or more Use Cases, and a Use Case can realize one or more Requirements.</p> <p>Whilst a Requirement defines a condition that must be met, the Use Case is the key to defining and visualizing how that condition is met. A Use Case diagram depicts the logical grouping of actions, processes and components to achieve a required result, and through the use of Actor elements also defines the user and/or system roles participating in the process.</p> <p>Each Use Case (as a composite element) can contain a combination of child diagrams that define in greater detail how a particular activity or facility might be implemented - such diagrams include Sequence,</p>	<p>Trace^[493]</p> <p>Traceability^[503]</p> <p>Connector Requirement^[1167]</p> <p>Use Case^[933]</p> <p>Use Case Diagram^[813]</p> <p>Actor^[877]</p> <p>Composite Element^[647]</p> <p>Sequence Diagram^[849]</p> <p>Communication Diagram^[859]</p> <p>Activity Diagram^[817]</p> <p>State Machine Diagram^[815]</p> <p>Business Rule Flow^[1205]</p>

Topic	Detail	See also
	<p>Communication, Activity, State Machine and Business Rule Flow diagrams. The actual implementation of each Use Case is realized by Class, Component and Interface elements organized in their own diagrams. These realizations can also be captured and viewed in Traceability diagrams, depicting the full development pathway from initial requirement through to testing and production.</p>	

7.3.1 Feature

Description

A *Feature* is a small, granular function or characteristic expressed in client-valued terms as a satisfaction of a requirement; for example: 'context-sensitive Help', or 'ability to reverse-engineer VB.Net'.

Features are the primary requirements-gathering artifact of the Feature-Driven Design (FDD) methodology. They define the product feature that satisfies what a Requirement element has formalized as a contractual, testable, expected deliverable (for example: requirement - 'every element must provide context-sensitive Help'; feature - 'every element provides context-sensitive Help'). One Feature might realize one or more Requirements, and one Requirement might be realized by more than one Feature.

Features also have relationships with Use Cases. A Use Case defines the interaction a user has with the system in order to satisfy one or more Requirements. The Feature identifies the facility that provides the means for that interaction.

Feature elements are non-UML and are not related to the UML elements of the same name which are either BehavioralFeatures (operations, or methods) or StructuralFeatures (Ports, Parts and attributes).

Feature elements are available from the **Requirements** page of the **Toolbox**.

Feature elements can be displayed with or without an identifying **F** in the top right corner of the element. To toggle the display of this letter, select or deselect the **Show stereotype icon for requirements** checkbox on the **Options** dialog, **Objects** page.

Toolbox Icon

7.3.2 Internal Requirements

Topic	Detail	See also
Usage	<p>Internal requirements in Enterprise Architect are element responsibilities. They are defined on the Requirements page of the element Properties dialog.</p> <p>Internal requirements form the functional requirements of the system to be built. The meaning of the requirement can vary depending on which element is the host; for example, a business process requirement might mean something different to a Use Case requirement, which again might mean something different to a Class requirement. In the example above, an internal responsibility to enable the user to login to the system has been defined for the Login Use Case. This is a responsibility of the Use Case - an action it is responsible for carrying out - and it applies only to this Use Case.</p> <p>The significant parameters (or, in Requirement Management terms, <i>attributes</i>) are the Type, Status, Difficulty and Priority. Whilst you can provide a detailed description of the responsibility in the Notes field, there is more scope in the name (Requirement field) to define the nature of the responsibility. An additional field, Stability, indicates the probability of the requirement changing; high stability means a low probability of change.</p> <p>The example Use Case above also has connections to two external requirements, which are system functions that the Use Case implements either in full or in part. You can convert an internal responsibility into an external requirement.</p> <p>You can also create internal responsibilities for an element using the Scenarios & Requirements window. A responsibility created in the window displays in the element Properties dialog, and vice versa.</p>	<p>Requirements ^[664]</p> <p>Make Internal Requirements External ^[1167]</p> <p>Scenarios & Requirements ^[689]</p>

7.3.2.1 Make Internal Requirement External

Elements in Enterprise Architect have internal requirements, or responsibilities (what they must do or accomplish). These often overlap or duplicate more formal requirements that the system in general must meet. You can move internal requirements to external requirements (where the requirement can perhaps be implemented by multiple elements) in one go, using the **Move External** function.

How To:

To change an internal requirement for an element into an external element, follow the steps below

Step	Action	See Also
1	Double-click on the element in a diagram or in the Project Browser The element Properties dialog displays	
2	Click on the Requirements tab	
3	Locate and highlight the requirement	
4	Click on the Move External button The Browse Project dialog displays	
5	Select the package to place the new requirement in	

Step	Action	See Also
6	Click on the OK button	

Enterprise Architect creates a new Requirement element in the target package and automatically generates a Realization connector from the element to the Requirement.

The requirement is now marked external and the dialog fields grayed out. To edit its details, double-click on the requirement.

The requirement element is now located in the target package.

Learn More:

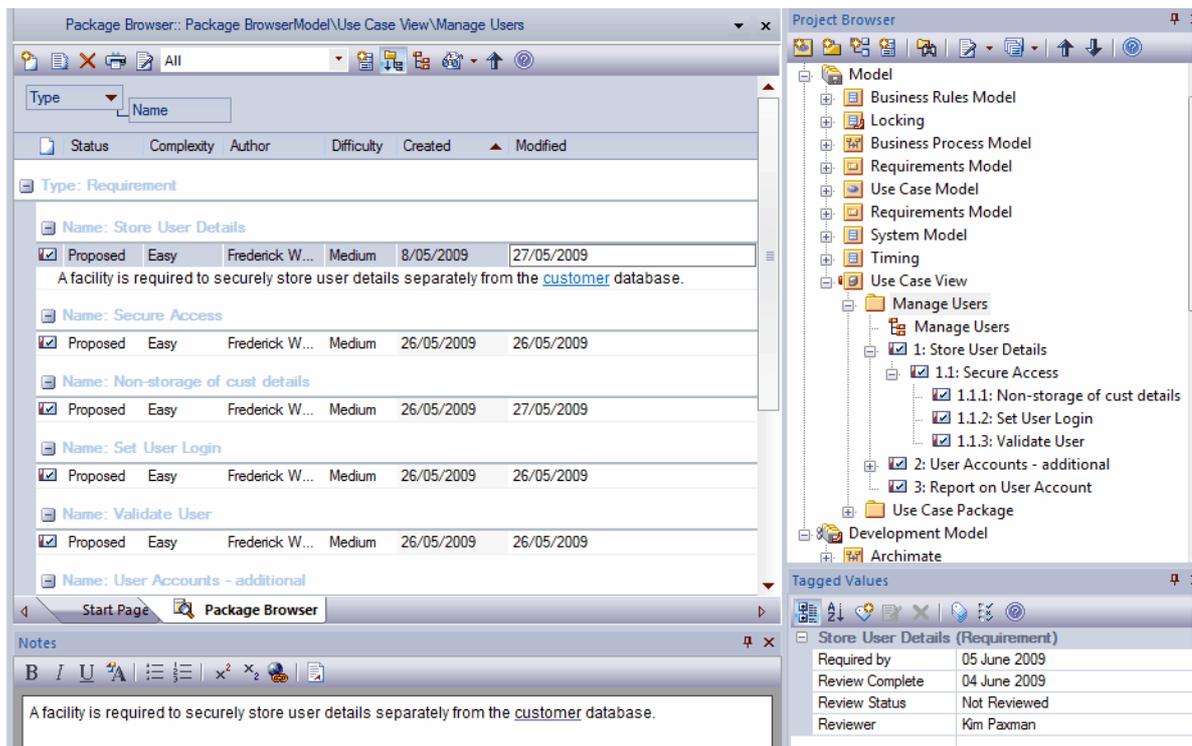

- [Requirement Properties](#) 1157

7.4 Manage Requirements

One of the main advantages of managing Requirements in Enterprise Architect is that you can display many different aspects of information on the Requirements, from overall organization and location through lists, current status, general properties, detailed individual notes and specific properties, to relationships and dependencies with other elements in the model.

As most of these aspects are displayed in dockable windows, you can review the Requirements from several different perspectives simultaneously in the Enterprise Architect work area, as shown below:

Example:

This display shows the position of the *Store User Details* Requirement element in the model, and how it relates to other Requirements (**Project Browser**); the default characteristics of the Requirement (**Package Browser**) and the extended characteristics (**Tagged Values** window), and a detailed description of the Requirement (**Notes** window). You can configure some of these windows to display more information, and/or use other windows and facilities.

Learn More:

- [View Requirements](#) ^[1170]
- [Trace Use of Requirements](#) ^[1170]
- [Manage Requirement Changes](#) ^[1171]
- [Report on Requirements](#) ^[1173]

7.4.1 View Requirements

Use the following windows and facilities to: locate and list Requirement elements in the model; add, move and delete the elements; display and edit the properties and characteristics of individual elements; and generate reports on packages or specific elements.

Topics:

Topic	Detail	See also
Usage	<p>Use the following windows and facilities to: locate and list Requirement elements in the model; add, move and delete the elements; display and edit the properties and characteristics of individual elements; and generate reports on packages or specific elements.</p> <ul style="list-style-type: none"> • Project Browser - shows the content and structure of your model • Diagram List - lists the elements in a diagram, filtered and sorted according to the settings you define; shows all or selected default properties of each element • Package Browser - lists the elements in a package, filtered and sorted according to the settings you define; shows all or selected default properties of each element • (Requirements) Diagram - shows the arrangement of a group of Requirements, and can show whether the elements are in the same package or different packages • Model Search - enables you to locate Requirements in general in the model, or specific Requirement elements, according to the search criteria you use • Model Views - enables you to maintain links to commonly-used elements, and to rapidly show developments and changes in (Requirement) package contents through either reports or slide shows of selected diagrams • Properties - shows every standard property of a selected element, whether updated by the user or maintained automatically by the system • Tagged Values - shows extended properties of a selected Requirement element • Element Browser - shows every added-on property, such as attributes, operations, Tagged Values and constraints • Notes - displays the detailed description of a requirement, and any other additional information recorded on the requirement 	<p>Project Browser ^[44]</p> <p>Diagram List ^[462]</p> <p>Package Browser ^[456]</p> <p>Requirements Diagram ^[1174] ^[540]</p> <p>Model Search ^[475]</p> <p>Model Views ^[464]</p> <p>Properties ^[689]</p> <p>Tagged Values ^[762]</p> <p>Element Browser ^[687]</p> <p>Notes ^[769]</p>

7.4.2 Trace Use of Requirements

Topics:

Topic	Detail	See also
Usage	<p>Having investigated the representation of requirements in your model, you might review either how they have been used to direct development through the model, or how a particular development was initiated. This is discussed in greater detail in the Traceability topics, but the windows and facilities you might use to follow development</p>	<p>Traceability ^[493]</p> <p>Connect Requirements ^[1167]</p> <p>Relationship</p>

Topic	Detail	See also
	<p>from Requirements are briefly described below. The significant feature in tracing Requirements and development is the connectors between the elements.</p> <ul style="list-style-type: none"> • Relationships window - quickly identifies every relationship of which a selected Requirement element is a member, and the partner element in that relationship, whether or not the relationship is visible in the current diagram. If the partner element is not in the diagram, you have the option of adding it • Traceability window - a very useful tool in showing chains of relationships that include the selected element. The window can show, for example, that a Requirement A is realized by a Use Case X, but Use Case X also realizes Requirement B, which in turn is also realized by Use Case Y. You can control the type and extent of these relationship chains, but as the system checks the connectors and partner elements of every relationship within the limits you impose, the system can take some time to produce the final results • Relationship Matrix - a significant tool in mapping the relationships between the Requirements elements in a package and other elements in either that package or a different package. Where a relationship is missing, you can add it; if an existing relationship is misplaced, you can delete it • Properties dialog, Requirements tab - for elements other than Requirements (particularly Use Cases), shows all internal responsibilities and external requirement elements attached to the element • Scenarios & Requirements window - as for the Properties dialog, shows the Requirements and responsibilities of the selected element, and the scenarios and constraints under which the Requirements are being realized 	<p>Window^[504]</p> <p>Traceability window^[495]</p> <p>Relationship Matrix^[496]</p> <p>Properties Dialog^[660]</p> <p>Requirements^[664]</p> <p>Scenarios & Requirements^[689]</p>

7.4.3 Manage Requirement Changes

Because requirements are statements of what a system or process must do or provide, they have a great impact on the modeling and development of the system. A new requirement might initiate an extensive program of work, and changes to or removal of that requirement can therefore have a major effect on the model. Issues concerning requirements, and changes to Requirements, must both be carefully managed.

The first steps in managing changes to requirements would be to raise *specific Issue and Change* request items against the Requirement element. You could monitor the appearance of these items using the filtered searches of the *Model Views*. You might then **review** the Requirement properties and/or its relationship hierarchies. During model development, you might capture periodic *Baselines* and use these to review the changes and, if necessary, roll them back to a previous point. You might also use the *Auditing* facility to monitor changes as they are made, and to ensure that no unauthorized or potentially risky changes are being made in the model.

These facilities are briefly discussed below.

Topics:

Topic	Detail	See also
Changes and Issues	A change is, very broadly, an item defining an addition or alteration to a requirement. An issue identifies either a failure to meet a requirement,	<p>Changes^[1721]</p> <p>Issues^[1719]</p>

Topic	Detail	See also
	<p>or a risk in meeting the requirement.</p> <p>Changes and issues can arise in development at a number of levels, being raised for problems that apply system-wide down to within a specific element. There are two mechanisms that can be used to identify a change or issue, and the work required to resolve it:</p> <ul style="list-style-type: none"> • Change and Issue (or Defect) elements - structured comments that identify a problem at system-level, although they can also be attached to a specific element from which a problem arises. Both types of element resemble the Requirement element, and can be linked to one or more other elements that have to be reviewed, with relationships such as Association, Dependency and Realize. The two types of element can also form hierarchies or groups, where complex problems arise • Maintenance items raised against a specific element, and recorded for that element in the Maintenance window. Maintenance items enable the distinction between Defects (a failure to meet a requirement) and Issues (a risk factor that might affect satisfying the requirement). They also include Tasks, which record work items associated with the element <p>Maintenance items are very specific, but if there is a possibility of an item having a wider impact on other elements or the system in general, you can translate the item into a Change or Issue element, or any other type of element that best identifies the problem and its solution.</p>	<p>Maintenance items ^[1713]</p> <p>Maintenance Workspace ^[1713]</p> <p>Create an Element From a Maintenance Item ^[1717]</p>
Model Views	<p>Model Views are very useful for trapping changes and issues in the model, especially on Requirements. You can set up searches to identify the appearance of new Change or Issue elements, or to detect changes in the properties of the Requirement elements themselves.</p>	<p>Model Views ^[464]</p>
Baselines	<p>A Baseline is a snapshot of a package or a model branch at a particular point in time, which you determine. You can use the Baseline as a distribution mechanism for changes to the model, but the main use is to enable you to compare the current model with a previous stage, and detect what changes have been made since the Baseline was captured. If you do not want a change to remain in the model, you can roll the affected elements back to the state they had in the Baseline. Therefore, if you maintain your requirements in a specific package or branch, you can capture Baselines of the package and ensure that changes conform to your change management process or, if not, can be reversed.</p>	<p>Baselines ^[370]</p>
Auditing	<p>The Auditing facility enables you to capture any changes made to your model within the selection criteria that you define. You can, for example, configure the Auditing facility to specifically record changes to Requirement elements. As auditing is continuously monitoring, you can detect changes as they are made, and verify that they are acceptable. You can also store the log of changes, and review it later on. Note that you cannot reverse the changes automatically, as you can with Baselines. You might therefore use Auditing to identify changes to investigate more fully and - if necessary - reverse in a Baseline comparison.</p>	<p>Auditing ^[298]</p> <p>Auditing Settings ^[300]</p>

7.4.4 Report on Requirements

Topics:

Topic	Detail	See also
Usage	<p>Enterprise Architect provides two report generation facilities that enable you to output RTF reports and HTML reports on your model structure and components. The RTF reporting facility is especially comprehensive, and contains a number of features that provide particular support to Requirements Management:</p> <ul style="list-style-type: none"> • A requirements report template that extracts details of external requirements in the model; you can copy and tailor this template for your particular requirements • Options in the Diagram List, Package Browser and Model Search to generate RTF reports on selected (Requirement) items from the collected information • The Implementation Report, which lists for a selected package the elements that require implementers, together with any source elements in Realize (Implements) relationships with those elements • The Dependency Report, which lists for a selected package any elements that are dependent on another element for their specification; for example, a Use Case derives its specification from the Requirement that it realizes 	<p>RTF Document ^[1726]</p> <p>RTF Dialog Options ^[1733]</p> <p>Diagram List ^[462]</p> <p>Package Browser ^[456]</p> <p>Model Search ^[475]</p> <p>Implementation Report ^[1785]</p> <p>Realization ^[1007]</p> <p>Dependency Report ^[1783]</p>

7.5 Requirements Diagram

A Requirements diagram is a custom diagram used to describe a system's requirements or features as a visual model.

Requirements are defined using Requirement elements (Custom elements of type Requirement). To view the detailed description of a Requirement, double-click on the element to display its properties.

Requirements can have relationships with other elements such as other Requirements and Use Cases. To view the traceability of a requirement, use the Traceability window.

Use To:

- Describe a system's requirements or features as a visual model
- Link Requirement elements to Use Cases and Components in the system to illustrate how a particular system requirement is met
- Enable traceability between specifications and design requirements, and the model elements that realize them

Example Diagram: [Example Requirements Diagram](#)^[1174]

Tools:

Select Requirements diagram elements and connectors from the Requirements pages of the Toolbox.

Requirements Diagram Elements	Requirements Diagram Connectors
 Package	 Aggregate
 Requirement	 Inheritance
 Feature	 Associate
 Object	 Implements

8 Domain Based Models

Enterprise Architect provides specific modeling tools for a range of specialized model types, as outlined below.

Enterprise Architect also provides an additional set of extended diagrams and a set of inbuilt and extension stereotype elements for more general use, and supports you in developing your own modeling languages.

Topic	Detail	See also
Requirements	Enterprise Architect is one of the few UML tools that integrate Requirements Management with other software development disciplines in the core product, by defining requirements within the model	Requirements modeling ^[1152]
Business Modeling	Modeling the business process is an essential part of any software development process, enabling the analyst to capture the broad outline and procedures that govern what it is a business does	Business modeling ^[1193]
Business Rules	Business Rule modeling captures the rules that govern a business, and their relationships with the entities and specific tasks within the organization or system	Business Rule modeling ^[1199]
BPMN	The Business Process Modeling Notation is specifically targeted at the business modeling community and has a direct mapping to UML through BPMN Profiles; these profiles enable you to develop BPMN diagrams quickly and simply	BPMN modeling ^[1219]
BPEL	Business Process Execution Language is an executable language for specifying interactions with Web Services Enterprise Architect uses the BPMN profile as a graphical front-end to capture BPEL Process descriptions	BPEL modeling ^[1235]
SysML	SysML is a general-purpose graphical modeling language for specifying, analyzing, designing, and verifying complex systems that might include hardware, software, information, personnel, procedures and facilities	Systems engineering (SysML) ^[1548]
Data Modeling	Enterprise Architect provides easy-to-use tools for building and maintaining all of the fundamental data models - Conceptual, Logical and Physical; because Enterprise Architect lets you visualize each type of data model in the same repository, you can easily manage dependencies between each level of abstraction	Data modeling ^[1276]
XSD	Enterprise Architect supports rapid modeling, forward	XML Schema modeling

Topic	Detail	See also
	engineering and reverse engineering of W3C XML schemas (XSD), critical for the development of a complete Service Oriented Architecture (SOA)	(XSD) ^[158]
WSDL	Enterprise Architect enables rapid modeling, forward engineering and reverse engineering of W3C XML Web Service Definition Language (WSDL), critical for the development of a complete Service Oriented Architecture (SOA)	Web Service modeling (WSDL) ^[161]
SPEM	The Software and Systems Process Engineering Meta-model (SPEM) is a conceptual framework for modeling, documenting, presenting, managing, interchanging, and enacting development methods and processes SPEM 2.0 focuses on providing the additional information structures that you require for processes modeled with UML 2 Activities or BPMN/BPDM	Software Process modeling (SPEM) ^[406]
ArchiMate	ArchiMate is an open-standard enterprise architecture language based on the IEEE 1471 standard, providing a common language for describing the construction and operation of business processes, organizational structures, information flows, IT systems and technical infrastructure It enables Enterprise Architects to clearly describe, analyse and visualize the relationships among business domains	ArchiMate ^[272]
Data Flow Diagrams	A data flow diagram (DFD) is a graphical representation of the flow of data through an information system, and can also be used to visualize data processing (structured design) Developing a DFD helps in identifying the transaction data in the data model	Data Flow Diagrams ^[184]
Entity Relationship Diagrams	Entity-relationship modeling is an abstract and conceptual database modeling method, used to produce a schema or semantic data model of, for example, a relational database and its requirements, visualized in Entity-Relationship Diagrams (ERDs) ERDs in Enterprise Architect assist you in building conceptual data models through to generating Data Definition Language (DDL) for the target DBMS	Entity Relationship Diagrams ^[382]
Eriksson-Penker Extensions	Eriksson-Penker extensions provide a framework for UML business processing model extensions, to which an Enterprise Architect can add stereotypes and properties appropriate to their business In Enterprise Architect, the Eriksson-Penker profile provides, through a set of stereotypes, a unique and powerful means of visualizing and communicating business processes and the necessary flow of information within an organization	Eriksson-Penker Extensions ^[273]
Group of Four Patterns	Gang of Four (GoF) Patterns are 23 classic software design patterns providing recurring solutions to	GoF Patterns ^[545]

Topic	Detail	See also
	<p>common problems in software design</p> <p>Enterprise Architect provides each pattern through an icon in the Diagram Toolbox</p>	
ICONIX	<p>The ICONIX Process is a streamlined approach to Use Case driven UML modeling that uses a core subset of UML diagrams and techniques to provide thorough coverage of object-oriented analysis and design</p> <p>Its main activity is robustness analysis, a method for bridging the gap between analysis and design</p>	ICONIX ^[1542]
Mind Mapping	<p>A Mind Map is an image-centered diagram used to represent semantic or other connections between words, ideas, tasks or other items arranged radially around a central key word or idea</p> <p>A Mind Map is used to generate, visualize, structure and classify ideas, and as an aid in study, organization, problem solving, decision making, and writing</p>	Mind Mapping ^[1182]
SoaML	<p>Service Oriented Architecture (SOA) is an architectural paradigm for defining how people, organizations and systems provide and use services to achieve results</p>	SoaML ^[1624]
SOMF	<p>The service-oriented modeling framework (SOMF) is a service-oriented development life cycle methodology, offering a number of modeling practices and disciplines that contribute to a successful service-oriented life cycle management and modeling</p>	SOMF ^[1628]
Extended Diagrams	<p>Enterprise Architect provides an additional set of diagram types that extend the core UML diagrams for domain-specific models</p> <p>Also, the specialized modeling tools listed in the first part of this table each have their own specialized diagrams</p>	<p>Analysis Diagram^[1187]</p> <p>Custom Diagram^[1185]</p> <p>Requirements Diagram^[1174]</p> <p>Maintenance Diagram^[1711]</p> <p>User Interface Diagram^[1287]</p> <p>Database Diagram^[1278]</p> <p>Business Modeling and Business Interaction Diagrams^[1191]</p>
Inbuilt and Extension Stereotypes	<p>Behavioral and Structural elements can be extended through the use of stereotypes; Enterprise Architect provides a number of inbuilt extensions</p>	Inbuilt and Extension Stereotypes ^[1288]
Build Your Own Modeling Language	<p>Enterprise Architect enables you to extend the scope both of your modeling and of the UML components you use, through the use of stereotypes, profiles and patterns to develop your own modeling applications</p>	Build Your Own Modeling Language ^[1038]

8.1 Domain Based Diagrams

In addition to diagrams defined by the UML, Enterprise Architect provides some extended diagram platforms to model business processes or develop custom diagrams.

Diagram Type	Detail	See also
Analysis Diagram	An Analysis diagram is a simplified Activity diagram, which is used to capture high level business processes and early models of system behavior and elements	Analysis Diagram ^[1187]
Custom Diagram	A Custom diagram is an extended Class diagram that is used to capture requirements, user interfaces or custom-design models	Custom Diagram ^[1183]
Requirements Diagram	A Requirements diagram is a custom diagram used to describe a system's requirements or features as a visual model	Requirements Diagram ^[1174]
Maintenance Diagram	A Maintenance diagram is a custom diagram used to describe change requests and issue items within a system model	Maintenance Diagram ^[1711]
User Interface Diagram	User Interface diagrams are custom diagrams used to visually mock-up a system's user interface using forms, controls and labels	User Interface Diagram ^[1281]
Data Modeling Diagram	A Data Modeling diagram is a Class diagram used for representing database schemas	Data Modeling Diagram ^[1278]
Documentation	Virtual documents enable you to structure and filter your RTF and HTML reports by selecting, grouping and ordering individual packages independent of the organization of the Project Browser	Documentation ^[1774]
Business Modeling and Business Interaction	Business Modeling diagrams and Business Interaction diagrams enable you to model both the structure and behavior of a business system Business Modeling diagrams are based on a Class (UML Structural) diagram, whilst Business Interaction diagrams are based on a Sequence (UML Behavioral) diagram	Business Modeling and Business Interaction ^[1191]

8.2.1 Mind Mapping

Access: From the Toolbox select: **More Tools | Mind Mapping**

Topics:

Topic	Detail	See also
Introduction	<p>The following text is derived from the Mind Map entry in the online Wikipedia.</p> <p><i>A Mind Map is a diagram used to represent words, ideas, tasks or other items linked to and arranged radially around a central key word or idea. It is used to generate, visualize, structure and classify ideas, and as an aid in study, organization, problem solving, decision making, and writing.</i></p> <p><i>A Mind Map is an image-centered diagram that represents semantic or other connections between portions of information. By presenting these connections in a radial, non-linear graphical manner, it encourages a brainstorming approach to any given organizational task, eliminating the hurdle of initially establishing an intrinsically appropriate or relevant conceptual framework to work within.</i></p> <p><i>The elements are arranged intuitively according to the importance of the concepts and are organized into groupings, branches, or areas. The uniform graphic formulation of the semantic structure of information on the method of gathering knowledge, may aid recall of existing memories.</i></p> <p>The use of the term Mind Maps is trademarked in the UK and the USA by The Buzan Organization, Ltd.</p>	<p>Mind Map (Online Resource)</p>
Mind Mapping in Enterprise Architect	<p>Enterprise Architect enables you to develop Mind Maps quickly and simply, through use of an MDG Technology integrated with the Enterprise Architect installer. The Mind Mapping facilities are provided in the form of:</p> <ul style="list-style-type: none"> • A Mind Mapping diagram type, accessed through the New Diagram dialog • A Mind Mapping page in the Toolbox • Mind Mapping element and relationship entries in the Toolbox Shortcut Menu and Quick Linker 	<p>New Diagram^[568]</p> <p>Toolbox Shortcut^[551]</p> <p>Quick Linker^[621]</p>

Topic	Detail	See also
<p>Mind Mapping Toolbox Page</p>	<p>The following icons are available:</p>  <ul style="list-style-type: none"> • <i>Central Topic</i> is the main theme of the Mind Map; you would normally have one or two of these on the diagram, but can add as many as are necessary • <i>Main Topic</i> represents the immediate concepts generated by the Central Topic • <i>Topic</i> represents the larger divisions of a Main Topic • <i>Sub Topic</i> represents the finer divisions of a Topic or Main Topic; you could also have Subtopics of Subtopics to represent increasingly finer distinctions • <i>Relationship</i> represents the connection between any two elements; you can have several Relationships per element. Each relationship has three anchor points, so you can curve the lines to develop the flow of concepts more easily <p>When dragged onto a Mind Mapping diagram, the elements and relationship have the following appearances:</p>  <p>As the elements can represent any concept, object or relationship, you can use the full range of element properties and features to expand on what the element represents, including adding Note elements. However, to preserve the simplicity and readability of the diagram itself, you cannot display the element compartments on the diagram.</p>	
<p>Disable Mind Mapping</p>	<p>If you prefer not to use Mind Mapping in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (Settings MDG Technologies).</p>	<p>MDG Technologies 10331</p>

8.2.2 Custom Diagram

A Custom diagram is an extended Class diagram that is used to capture requirements, user interfaces or custom-design models.

Custom models provide a few extensions to the UML model and enable some exploratory and non-rigorous

experimentation with model elements and diagrams.

Tools:

Select Custom diagram elements and connectors from the Custom pages of the Toolbox.

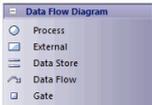

Custom Diagram Elements	Custom Diagram Connectors
 Package	 Associate
 Requirement	 Aggregate
 Issue	 Generalize
 Change	 Realize
 Screen	 Nesting
 UI Control	
 Test Case	
 Entity	

8.2.3 Data Flow Diagrams

Access: From the Toolbox select: **More Tools | Data Flow Diagrams**

Topics:

Images	Topic	Detail	See also
	Introduction	<p>The following text is derived from the Data Flow Diagram entry in the online Wikipedia.</p> <p><i>A data flow diagram (DFD) is a graphical representation of the "flow" of data through an information system. A data flow diagram can also be used for the visualization of data processing (structured design). It is common practice for a designer to draw a context-level DFD first which shows the interaction between the system and outside entities. This context-level DFD is then "exploded" to show more detail of the system being modeled.</i></p> <p><i>Data flow diagrams were invented by Larry Constantine ... based on Martin and Estrin's "data flow graph" model of computation. (They) are one of the three essential perspectives of Structured Systems Analysis and Design Method SSADM. The sponsor of a project and the end users will need to be briefed and consulted throughout all stages of a system's evolution. With a dataflow diagram, users are able to visualize how</i></p>	<p>Data Flow Diagram (Online Resource)</p>

Images	Topic	Detail	See also
		<p><i>the system will operate, what the system will accomplish, and how the system will be implemented. The old system's dataflow diagrams can be drawn up and compared with the new system's dataflow diagrams to draw comparisons to implement a more efficient system.</i></p> <p><i>Developing a DFD helps in identifying the transaction data in the data model.</i></p>	
	<p>Data Flow Diagrams in Enterprise Architect</p>	<p>Enterprise Architect enables you to develop Data Flow diagrams quickly and simply, through use of an MDG Technology integrated with the Enterprise Architect installer. The Data Flow diagram facilities are provided in the form of:</p> <ul style="list-style-type: none"> • A Data Flow diagram type, accessed through the New Diagram dialog • A Data Flow Diagram page in the Toolbox • Data Flow element and relationship entries in the Toolbox Shortcut Menu and Quick Linker 	<p>New Diagram [568]</p> <p>Toolbox Shortcut [55]</p> <p>Quick Linker [622]</p>
	<p>Data Flow Diagram Toolbox Page</p>	<p>The following icons are available:</p> <ul style="list-style-type: none"> • <i>Process</i> is a process or activity in which data is used or generated • <i>External</i> represents an external source, user or depository of the data • <i>Data Store</i> represents an internal physical or electronic repository of data, into and out of which data is stored and retrieved • <i>Data Flow</i> (connector) represents how data flows through the system, in physical or electronic form • <i>Gate</i> represents the termination point of incoming and outgoing messages on a lower level diagram (that is, messages to and from processes depicted elsewhere) <p>When dragged onto a Data Flow diagram, the elements and relationship have the following appearances:</p>	

Images	Topic	Detail	See also
		<p>To preserve the simplicity and readability of the diagram, you cannot display the element compartments on the diagram.</p>	
	Context Diagram	A <i>Context</i> diagram is a top-level Data Flow diagram that has just one Process element representing the system being modeled, showing its relationship to external systems.	
	Disable Data Flow Diagrams	If you prefer not to use Data Flow Diagramming in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (Settings MDG Technologies).	MDG Technologies <small>1033</small>

8.2.4 Analysis Stereotypes

Description

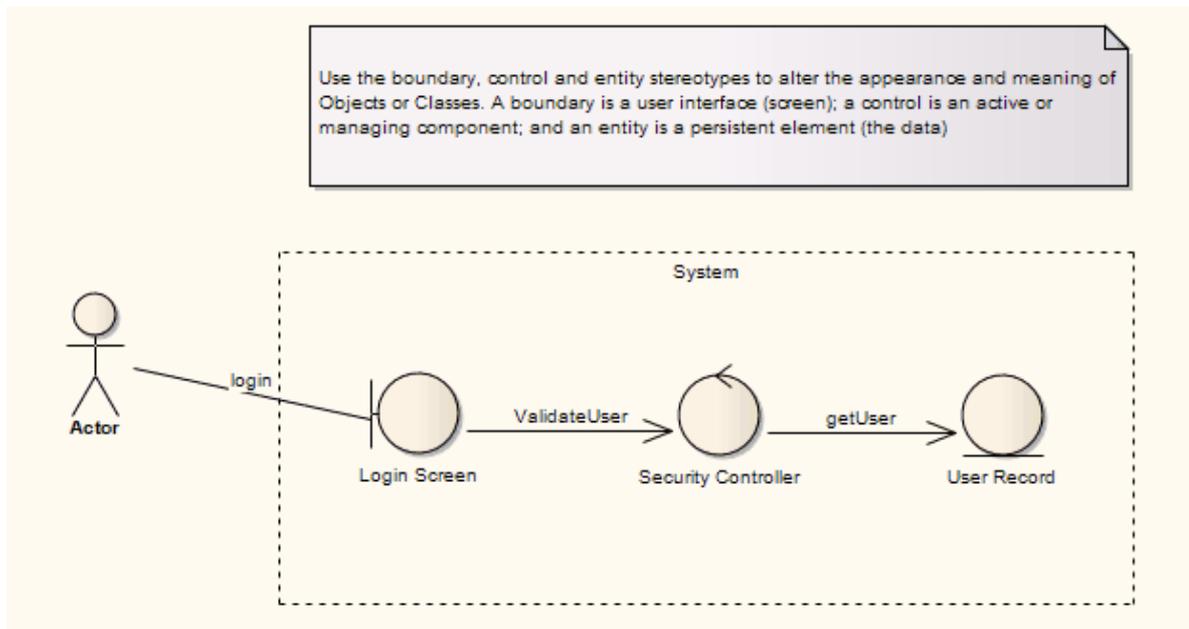

Enterprise Architect has some built in stereotypes that you can assign to an element during analysis. The effect of these stereotypes is to display a different icon from the normal element icon, providing a visual key to the element purpose. The *Robustness* diagram below illustrates the main types of inbuilt icons for elements.

The stereotypes used are:

- Boundary - for a system boundary (for example, a Login screen)
- Control - to specify an element is a controller of some process (as in the Model-View-Controller pattern)
- Entity - the element is a persistent or data element

Also see the Business Modeling elements, used in Business Modeling and Business Interaction diagrams.

Example

Use the boundary, control and entity stereotypes to alter the appearance and meaning of Objects or Classes. A boundary is a user interface (screen); a control is an active or managing component; and an entity is a persistent element (the data)

8.2.5 Analysis Diagram

An Analysis diagram is a simplified Activity diagram, which is used to capture high level business processes and early models of system behavior and elements. It is less formal than some other diagrams, but provides a good means of capturing the essential business characteristics and requirements.

Robustness diagrams, used extensively in ICONIX, can be created as Analysis diagrams.

Example Diagram: [Example Analysis Diagram](#)^[1189]

Tools:

Select Analysis diagram elements and connectors from the Analysis pages of the Toolbox.

Analysis Diagram Elements	Analysis Diagram Connectors
Actor	Information Flow
Object	Object Flow
Process	Associate
Collaboration	Realize

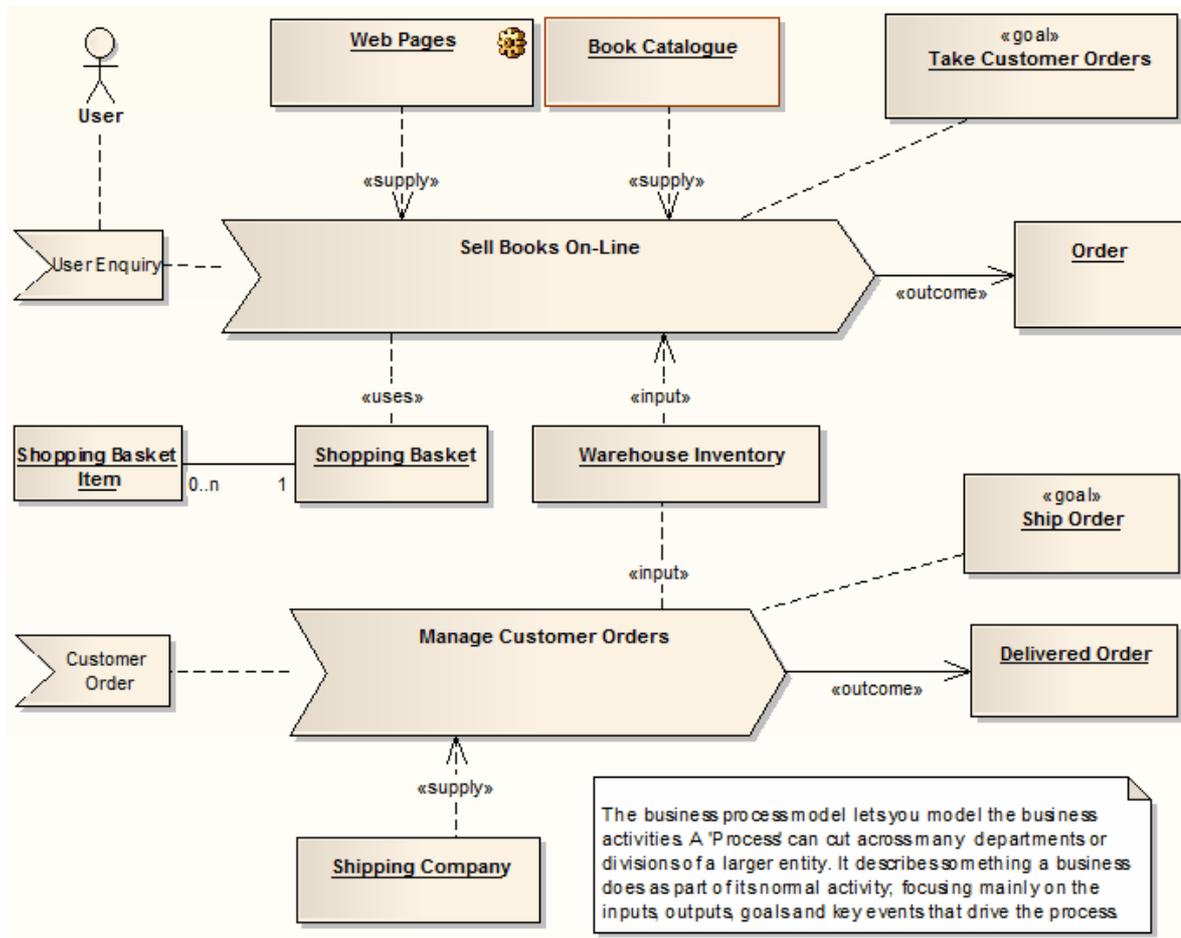

Analysis Diagram Elements	Analysis Diagram Connectors

8.3 Business Models

Enterprise Architect provides specific modeling tools for a range of analysis and Business Modeling types.

Topic	Detail	See also
Requirements	Enterprise Architect is one of the few UML tools that integrate Requirements Management with other software development disciplines in the core product, by defining requirements within the model	Requirements modeling ^[1152]
Business Modeling	Modeling the business process is an essential part of any software development process, enabling the analyst to capture the broad outline and procedures that govern what it is a business does	Business modeling ^[1193]
Business Rules	Business Rule modeling captures the rules that govern a business, and their relationships with the entities and specific tasks within the organization or system	Business Rule modeling ^[1199]
BPMN	The Business Process Modeling Notation is specifically targeted at the business modeling community and has a direct mapping to UML through BPMN Profiles; these profiles enable you to develop BPMN diagrams quickly and simply	BPMN modeling ^[1219]
BPEL	Business Process Execution Language is an executable language for specifying interactions with Web Services Enterprise Architect uses the BPMN profile as a graphical front-end to capture BPEL Process descriptions	BPEL modeling ^[1235]
SPEM	The Software and Systems Process Engineering Meta-model (SPEM) is a conceptual framework for modeling, documenting, presenting, managing, interchanging, and enacting development methods and processes SPEM 2.0 focuses on providing the additional information structures that you require for processes modeled with UML 2 Activities or BPMN/BPDM	Software Process modeling (SPEM) ^[408]
ArchiMate	ArchiMate is an open-standard enterprise architecture language based on the IEEE 1471 standard, providing a common language for describing the construction and operation of business processes, organizational structures, information flows, IT systems and technical infrastructure It enables Enterprise Architects to clearly describe, analyse and visualize the relationships among business domains	ArchiMate ^[1272]
Data Flow Diagrams	A data flow diagram (DFD) is a graphical representation of the flow of data through an information system, and can also be used to visualize data processing (structured design) Developing a DFD helps in identifying the transaction data in the data model	Data Flow Diagrams ^[1184]

Topic	Detail	See also
Entity Relationship Diagrams	Entity-relationship modeling is an abstract and conceptual database modeling method, used to produce a schema or semantic data model of, for example, a relational database and its requirements, visualized in Entity-Relationship Diagrams (ERDs) ERDs in Enterprise Architect assist you in building conceptual data models through to generating Data Definition Language (DDL) for the target DBMS	Entity Relationship Diagrams ^[1382]
Eriksson-Penker Extensions	Eriksson-Penker extensions provide a framework for UML business processing model extensions, to which an Enterprise Architect can add stereotypes and properties appropriate to their business In Enterprise Architect, the Eriksson-Penker profile provides, through a set of stereotypes, a unique and powerful means of visualizing and communicating business processes and the necessary flow of information within an organization	Eriksson-Penker Extensions ^[1273]
Mind Mapping	A Mind Map is an image-centered diagram used to represent semantic or other connections between words, ideas, tasks or other items arranged radially around a central key word or idea A Mind Map is used to generate, visualize, structure and classify ideas, and as an aid in study, organization, problem solving, decision making, and writing	Mind Mapping ^[1182]
SoaML	Service Oriented Architecture (SOA) is an architectural paradigm for defining how people, organizations and systems provide and use services to achieve results	SoaML ^[1624]
SOMF	The service-oriented modeling framework (SOMF) is a service-oriented development life cycle methodology, offering a number of modeling practices and disciplines that contribute to a successful service-oriented life cycle management and modeling	SOMF ^[1628]

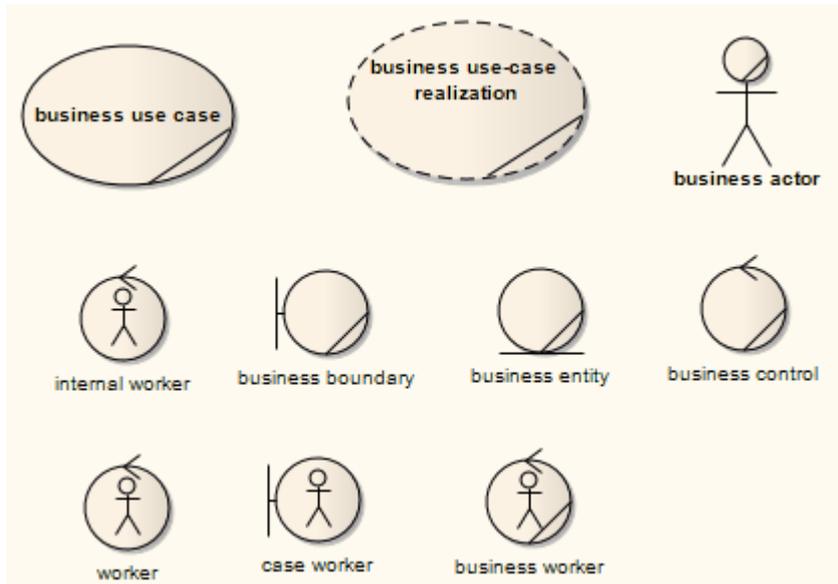

8.3.1 Business Modeling/Interaction

Business Modeling diagrams and Business Interaction diagrams enable you to model both the structure and behavior of a business system. Business Modeling diagrams are based on a Class (UML Structural) diagram, whilst Business Interaction diagrams are based on a Sequence (UML Behavioral) diagram. Both diagram types have the same default Toolbox, which consists of a Business Modeling element page. The available elements include stereotyped Objects, and a stereotyped Actor (Business Actor), Use Case (Business Use Case) and Collaboration (Business Use Case Realization).

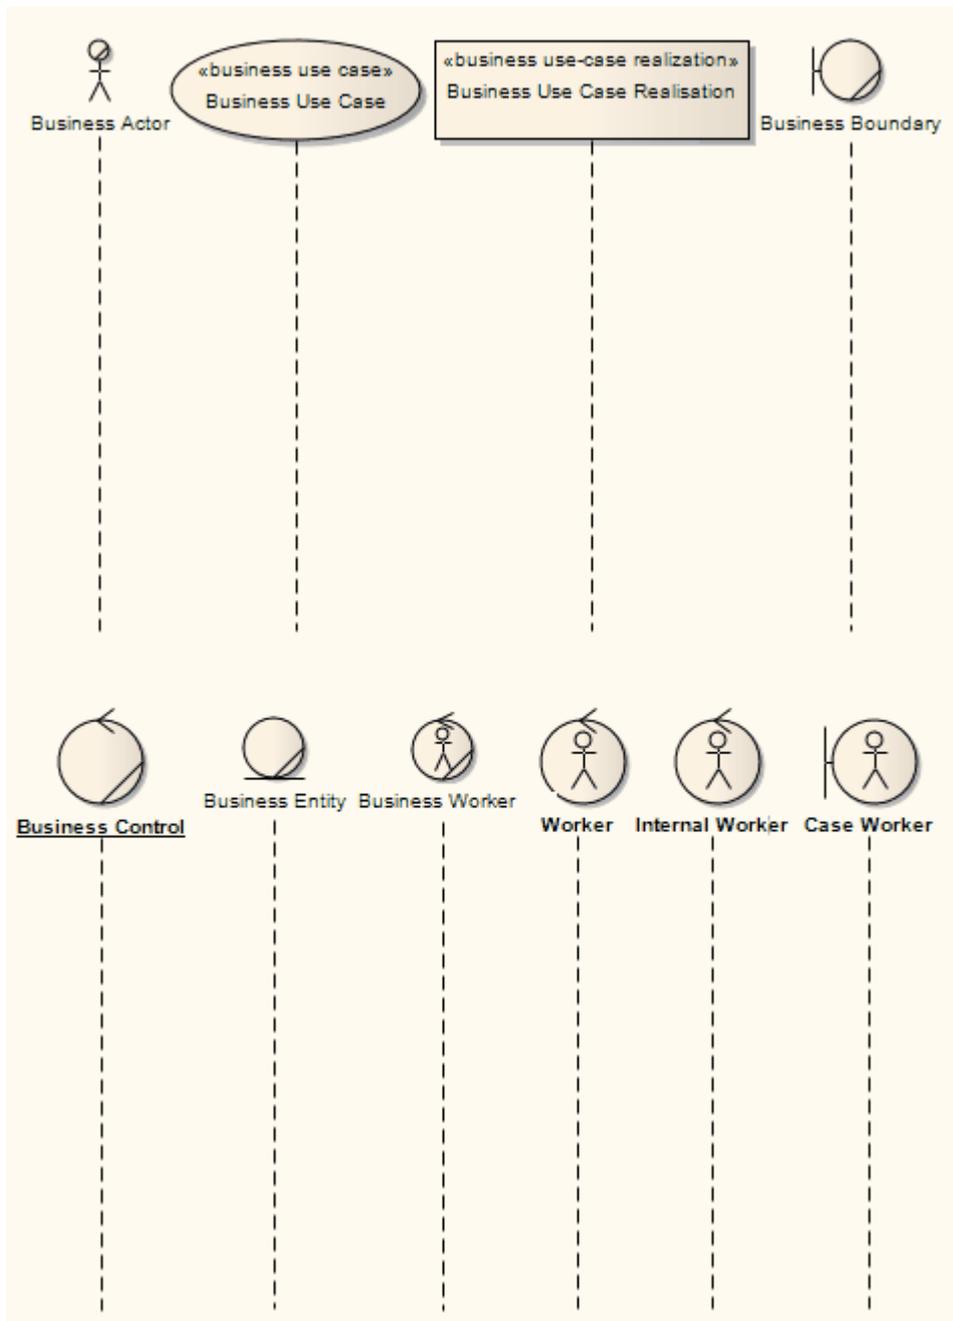

Example Diagram: [Example Business Modeling Diagram](#) ^[1192]

8.3.1.1 Example Business Modeling Diagram

The following diagram shows the appearance of the elements when dragged and dropped onto a Business Modeling diagram:

The following diagram shows the appearance of the elements when dragged and dropped onto a Business Interaction diagram:

8.3.2 Business Models

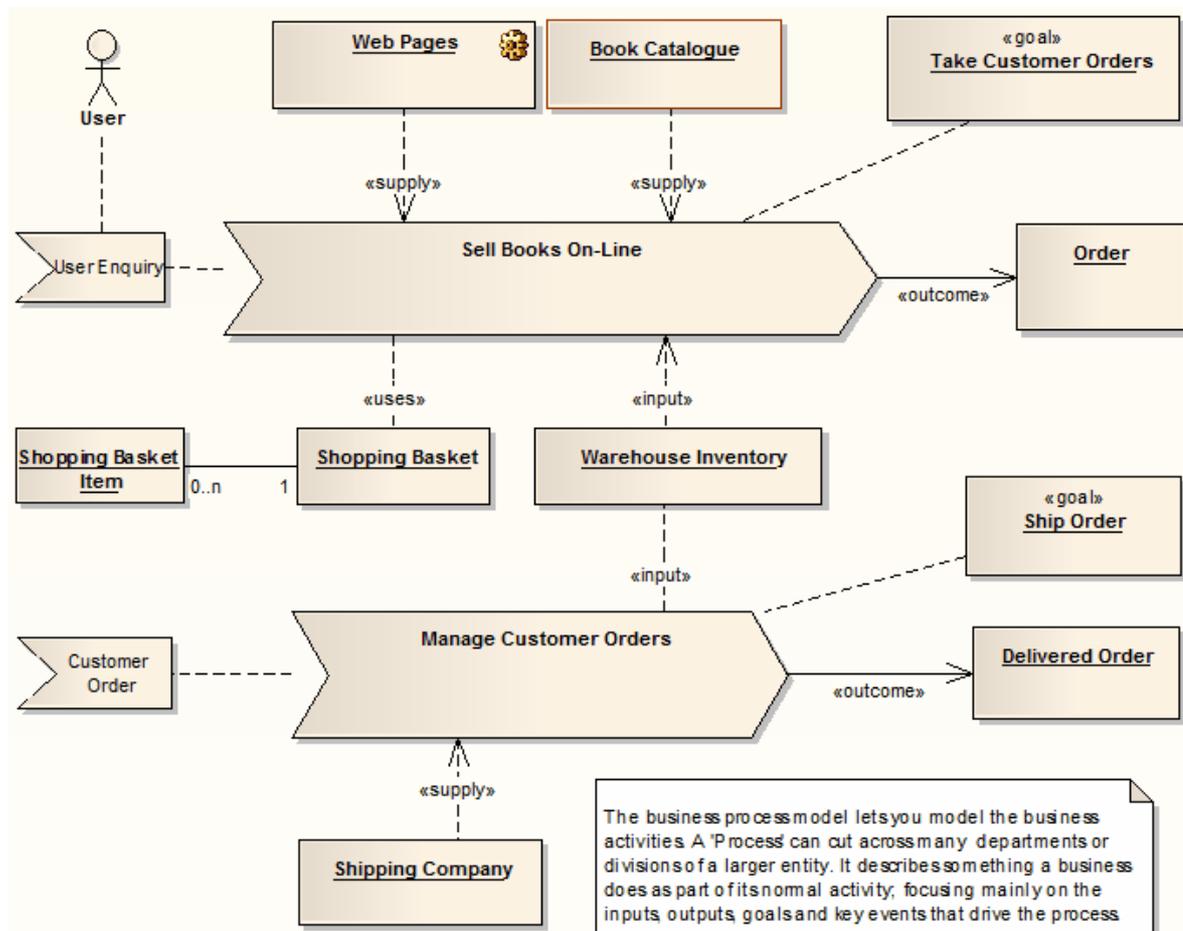

Topics:

Topic	Detail	See also
Modeling the Business Process	Modeling the business process is an essential part of any software development process. It enables the analyst to capture the broad outline and procedures that govern what it is a business does. This analysis model provides an overview of where the proposed software system being considered fits into the organizational structure and daily activities. It can also provide the justification for building the system by capturing the current manual and automated procedures	Analysis Model [1193]

Topic	Detail	See also
	<p>that are to be rolled up into a new system, and the associated cost benefit.</p> <p>As an early model of business activity, it enables the analyst to capture the significant events, inputs, resources and outputs associated with business process. By connecting later design elements (such as Use Cases) back to the business process model through Implementation connectors, it is possible to build up a fully traceable model from the broad process outlines to the functional requirements and eventually to the software artefacts actually being constructed.</p> <p>As the Business Process Model typically has a broader and more inclusive range than just the software system being considered, it also enables the analyst to clearly map what is in the scope of the proposed system and what is to be implemented in other ways (such as a manual process).</p>	

Example:

The example below demonstrates the kind of model that can be built up to represent a business process. In this model, the goal of the business process is to take customer orders and to ship those orders out. A user starts the process with an inquiry, which leads to the involvement of the Book Catalogue, Shopping Cart, on-line pages and warehouse inventory. The output of significance to the business is a customer order.

The second half of the process model is to respond to a customer order and ship the required items. The second process involves the warehouse inventory and shipping company, and completes when an order is delivered to the customer.

8.3.2.1 Analysis Models

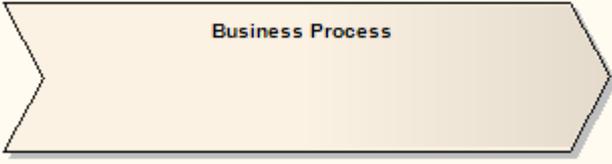

This section discusses the development of analysis models to construct business processes. It describes:

Topic	Link
Process Modeling Notation	Process Modeling Notation ^[1195]
Inputs, Resources and Information	Inputs, Resources and Information ^[1196]
Events	Events ^[1197]
Outputs	Outputs ^[1197]
Goals	Goals ^[1198]
A Complete Business Process	A Complete Business Process ^[1198]

8.3.2.1.1 Process Modeling Notation

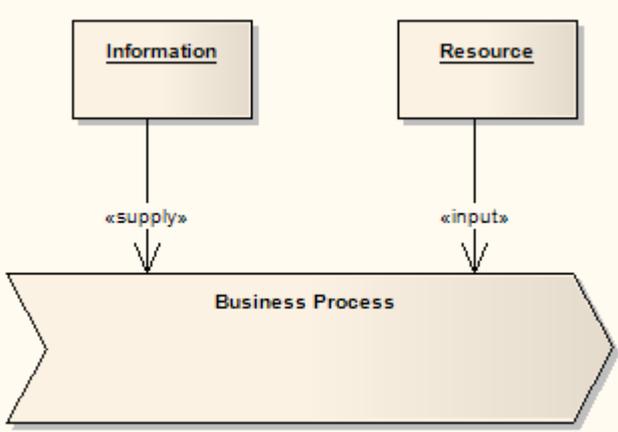

Topics:

Topic	Detail	See also
Abstract	<p>A business process model typically defines the following elements:</p> <ul style="list-style-type: none"> • The goal or reason for the process • Specific inputs • Specific outputs • Resources consumed • Activities that are performed in some order, and • Events that drive the process <p>The business process:</p> <ul style="list-style-type: none"> • Can affect more than one organizational unit • Can have a horizontal organizational impact • Creates value of some kind for the customer; customers can be internal or external <p>A business process is a collection of activities designed to produce a specific output for a particular customer or market. It implies a strong emphasis on how the work is done within an organization, in contrast to a product's focus on what. A process is thus a specific ordering of work activities across time and place, with a beginning, an end, and clearly defined inputs and outputs: a structure for action. The notation used to depict a business process is illustrated below.</p>	<p>Process^[1297]</p> <p>Events^[1197]</p> <p>Activity^[873]</p>

Topic	Detail	See also
	 <p>The process notation implies a flow of activities from left to right. Typically an Event element is placed to the left of the process and the output to the right. To specifically notate the internal activities, Activity elements can be placed inside the process element.</p>	
The BPMN File	<p>One popular notation and approach to business modeling is the Business Process Modeling Notation (BPMN). This notation is specifically targeted at the business modeling community and has a relatively direct mapping to UML through a BPMN Profile. Sparx Systems provides a built-in profile for BPMN modeling in Enterprise Architect.</p>	BPMN Models <small>[1219]</small>

8.3.2.1.2 Inputs, Resources and Information

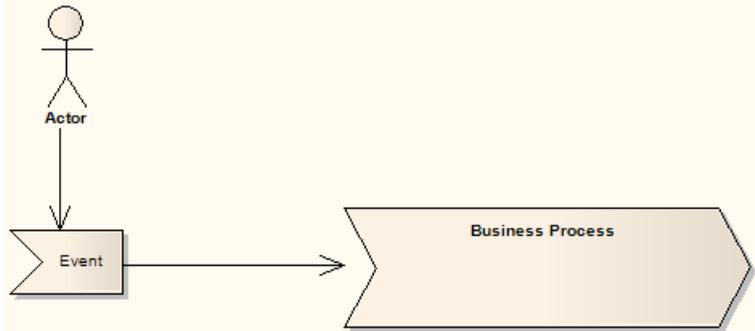

Topics:

Topic	Detail	See also
Abstract	<p>Business processes use information to tailor or complete their activities. Information, unlike resources, is not consumed in the process; rather it is used as part of the transformation process. Information can come from external sources, from customers, from internal organizational units and could even be the product of other processes. A resource is an input to a business process and, unlike information, is typically consumed during the processing. For example, as each daily train service is run and actuals recorded, the service resource is 'used up' as far as the process of recording actual train times is concerned.</p> <p>The notation to illustrate information and resources is shown below.</p>  <p>A <i>Supply</i> connector indicates that the information or object linked to the process is not used up in the processing phase. For example, order templates can be used over and over to provide new orders of a</p>	

Topic	Detail	See also
	<p>certain style; the templates are not altered or exhausted as part of this activity.</p> <p>An <i>Input</i> connector indicates that the attached object or resource is consumed in the processing procedure. As an example, as customer orders are processed they are completed and signed off, and typically are used only once per unique resource (order).</p>	

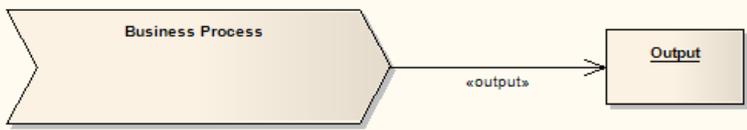

8.3.2.1.3 Events

Topics:

Topic	Detail	See also
Abstract	<p>An event is the receipt of some object, a time or date reached, a notification or some other trigger that initiates the business process. The event might be consumed and transformed (for example a customer order) or simply act as a catalyst (for example, nightly batch job).</p>  <p>The diagram illustrates the flow from an Actor to an Event and then to a Business Process. An Actor (represented by a stick figure) has a downward arrow pointing to an Event (represented by a trapezoidal shape with a pointed right side). From the Event, a horizontal arrow points to a Business Process (represented by a large arrow-shaped box pointing to the right).</p>	<p>Event^[1292]</p>

8.3.2.1.4 Outputs

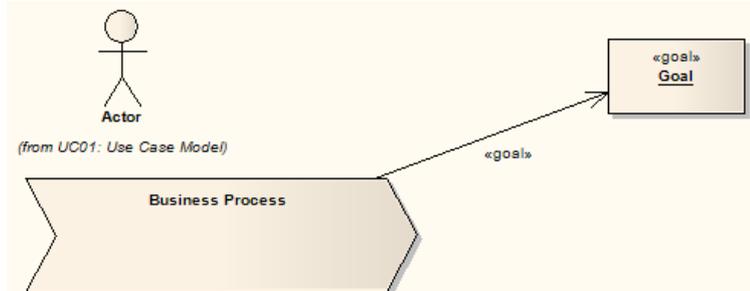

Topics:

Topic	Detail	See also
Abstract	<p>A business process typically produces one or more outputs of value to the business, either for internal use or to satisfy external requirements. An output might be a physical object (such as a report or invoice), a transformation of raw resources into a new arrangement (a daily schedule or roster) or an overall business result such as completing a customer order.</p> <p>An output of one business process might feed into another process, either as a requested item or a trigger to initiate new activities.</p>  <p>The diagram shows a Business Process (represented by a large arrow-shaped box pointing right) with an arrow labeled «output» pointing to an Output (represented by a rectangular box).</p> <p>An Output connector indicates that the business process produces</p>	

Topic	Detail	See also
	some object (either physical or logical) that is of value to the organization, either as an externally visible item or as an internal product (possibly feeding another process).	

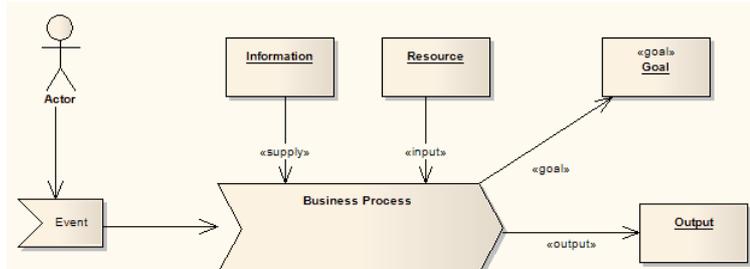

8.3.2.1.5 Goals

Topics:

Topic	Detail	See also
Abstract	<p>A business process has some well defined goal. This is the reason the organization does this work, and should be defined in terms of the benefits this process has for the organization as a whole and in satisfying the business requirements.</p>  <p>A Goal connector indicates that the attached object to the business process describes the goal of the process. A goal is the business justification for performing the activity.</p>	

8.3.2.1.6 A Complete Business Process

Topics:

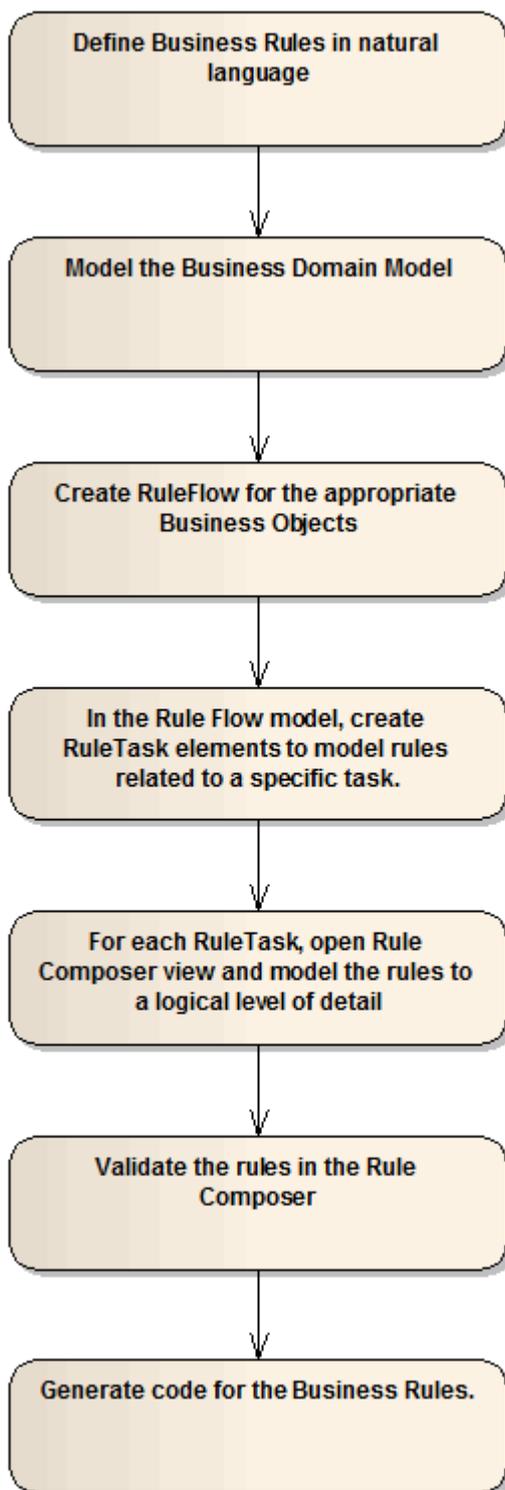

Topic	Detail	See also
Abstract	<p>The diagram below illustrates how the various model elements can be grouped together to produce a coherent picture of a named business process. Included are the inputs, outputs, events, goals and other resources that are of significance.</p> 	

8.3.3 *Business Rules*

To model Business Rules in Enterprise Architect, work through the following steps

Example:

These steps are represented graphically in the following flow:

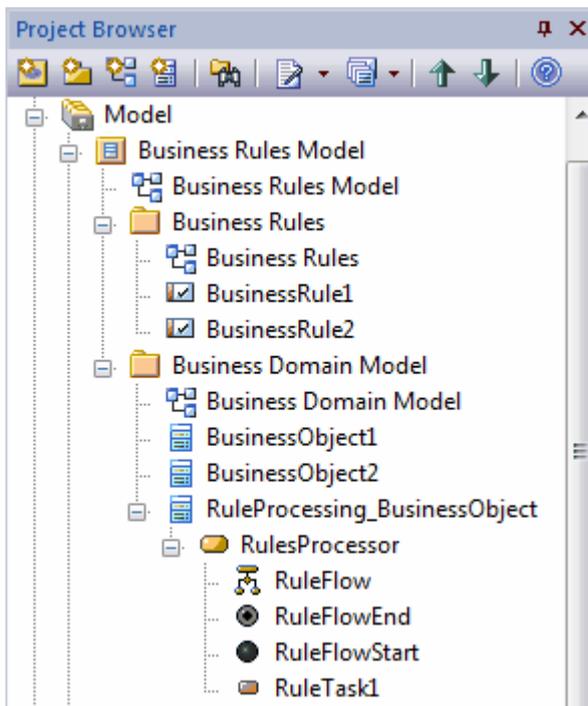

To create a Business Rule Model from a template provided with Enterprise Architect, follow the steps below

How To:

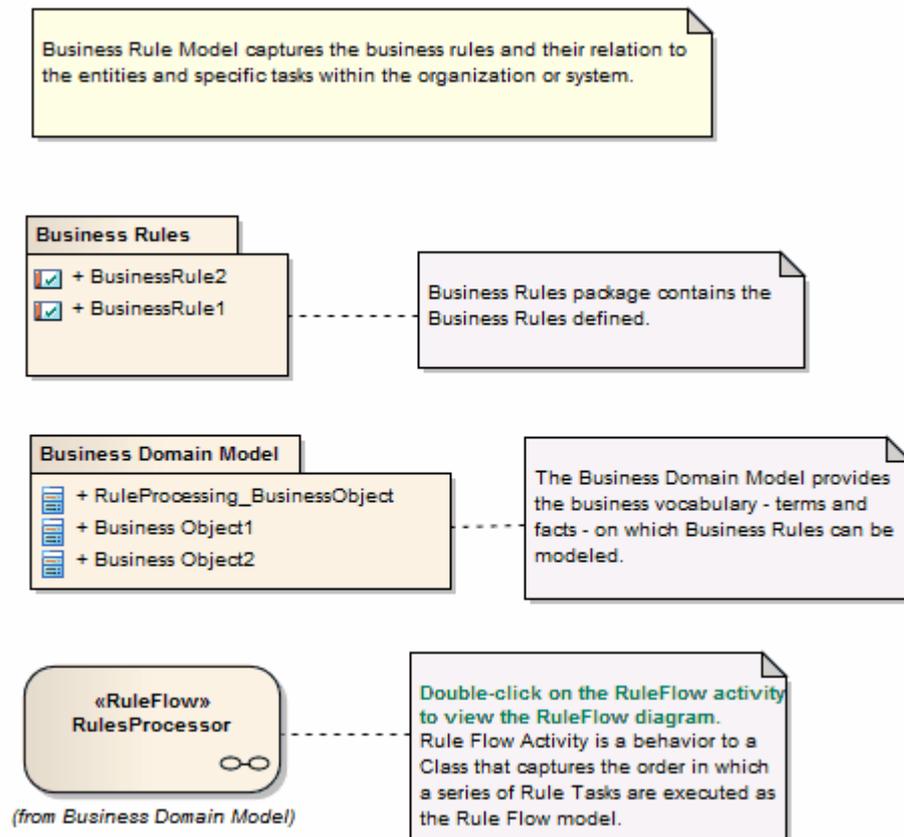

Step	Action	See Also
1	<p>In the Project Browser, either:</p> <ul style="list-style-type: none"> • Click on the New Model From Pattern icon in the toolbar • Right-click on a model root node and select the Add a New Model using Wizard context menu option • Right-click on a package and select the Add Add a New Model using Wizard context menu option <p>The Select Model(s) dialog displays.</p>	
2	<p>In the Select From field, click on the drop-down arrow and select Business Rule Model. Alternatively, if it is listed in the Technology panel, select the Business Rule Model item.</p>	
3	<p>In the Name panel, select the checkbox next to the Business Rule Model icon.</p>	
4	<p>Click on the OK button.</p>	

The following model structure is created in the **Project Browser**:

Example:

The *Business Rules Model* diagram, shown below, encapsulates the components of the Business Rules model.

**Notes:**

- Business Rule Modeling is available in the Business and Software Engineering edition and Ultimate edition of Enterprise Architect

Learn More:

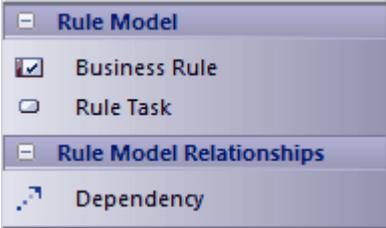

- [Create a Rule model](#) ^[1200]
- [Create a Business Domain Model](#) ^[1204]
- [Create a Rule Flow Model](#) ^[1206]
- [Compose Business Rules](#) ^[1211]
- [Validate Business Rules](#) ^[1216]
- [Code Generation for Business Rules](#) ^[1217]

8.3.3.1 Model Business Rules For RuleTasks

The *Rule Model* enables you to define *Business Rule* elements and associate them with a Rule Task. In the example, you might define a set of rules to perform an eligibility check for a customer, to determine if the customer is eligible to rent a car.

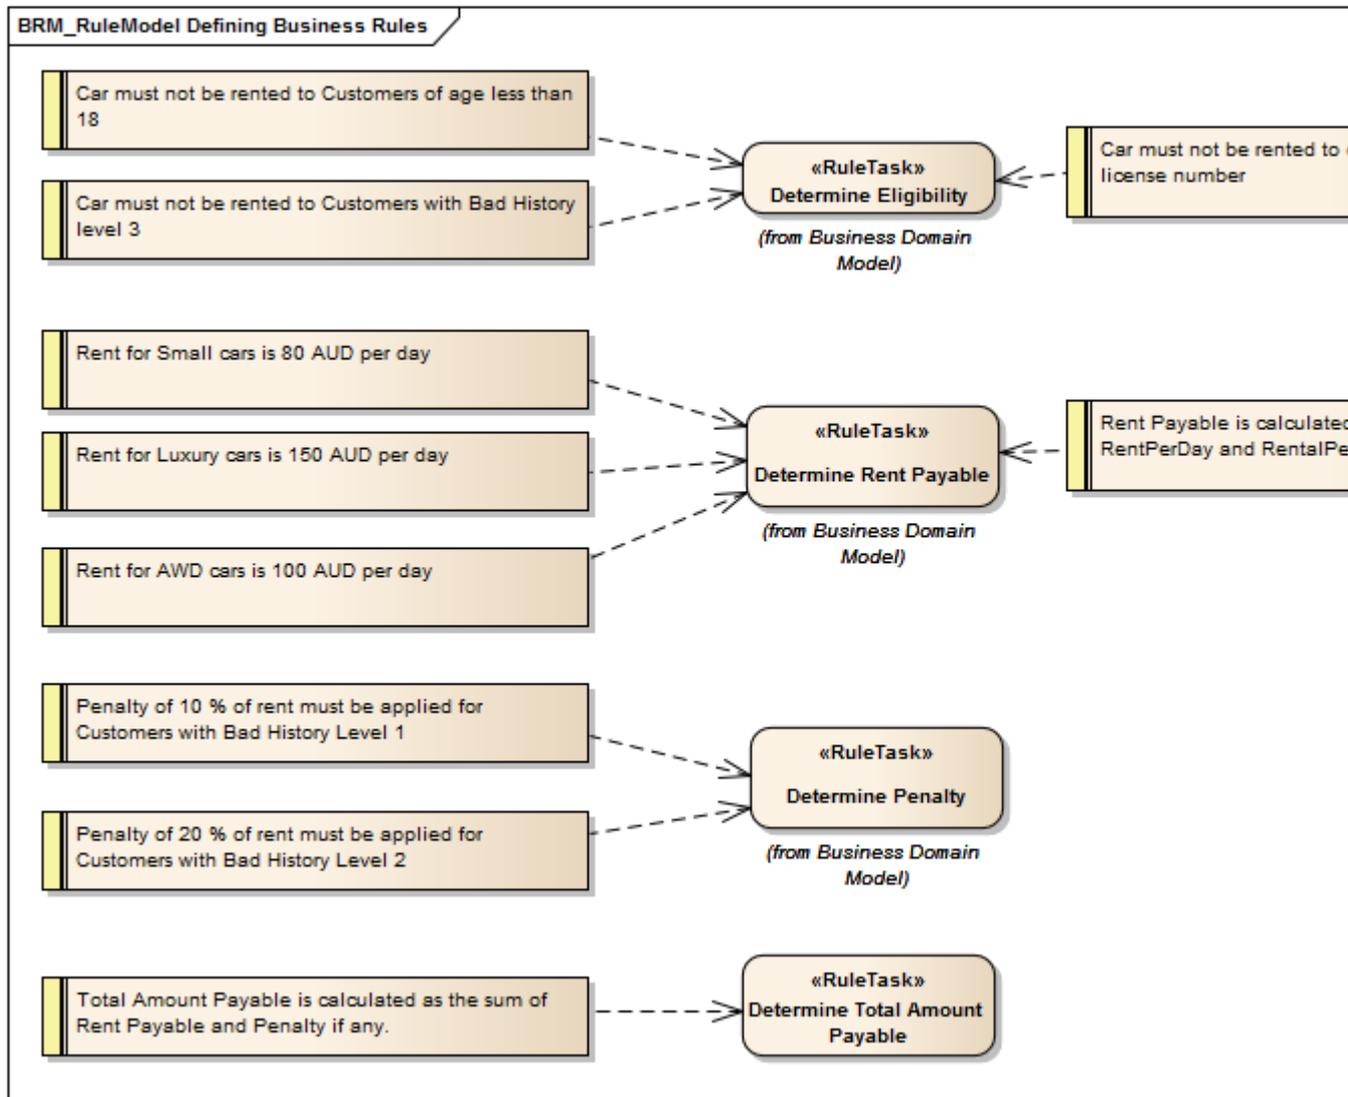

How To:

To define Business Rule elements and associate them with a Rule Task, follow the steps below:

Step	Action	See Also
1	Create a diagram of type <i>Rule Model</i> ; the Rule Model pages display in the Toolbox 	
2	Drag and drop a Rule Task element (<i>Determine Eligibility</i> in the example) from the Rule Flow Activity diagram package onto the Rule Model diagram	
3	Drag as many Business Rule elements as necessary from the Toolbox (or Project Browser if they exist already) onto the diagram You type the rule as the element name here, then define the parameters of the rules using the Rule Composer	Composing Business Rules <small>1217</small>
4	Create a Dependency relationship between each Business Rule element and the Rule Task element However, when you bring the rule into the Rule Composer, it automatically creates the Dependency relationship anyway	
5	Repeat steps 2 - 4 for the next Rule Task element	

Example:

The resulting Rule Model resembles the following diagram:

After you have modeled rules for all the Rule Task elements in the Rule Flow diagram, the Business Domain model is ready for **code transformation**. The code templates for generating technology-specific rule code work hand-in-hand with the **EASL code templates** to generate the code for the Rule Flow diagram.

Learn More:

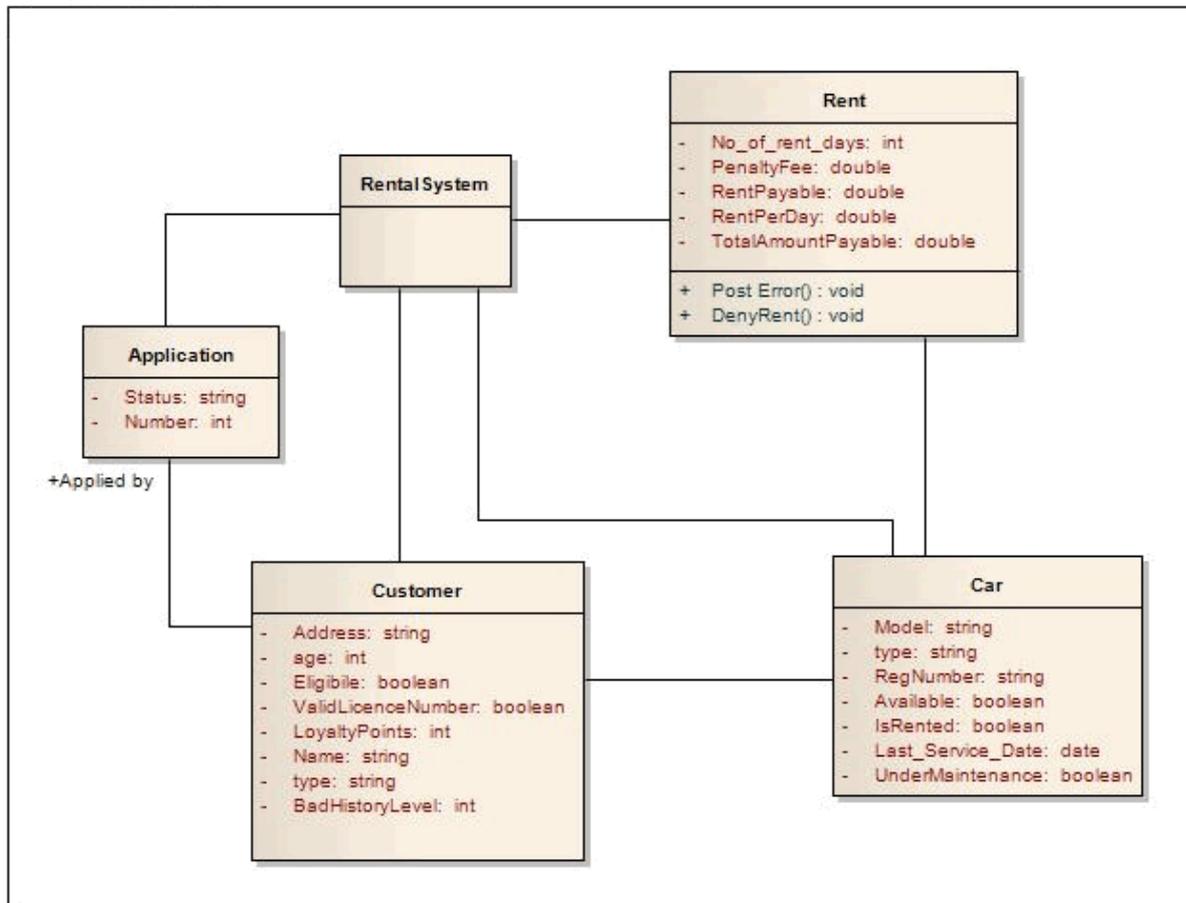

- [Code Generation for Business Rules](#) ^[1217]
- [EASL code templates](#) ^[1137]

8.3.3.2 Create a Business Domain Model

The *Business Domain Model* provides the business vocabulary - terms and facts - on which Business Rules can be modeled. In Enterprise Architect a Business Domain model is created as a conceptual Class diagram.

Example:

The following diagram shows an example Business Domain model, for a Car Rental system.

In the example Business Domain model, the Classes *Rent*, *Customer*, *Car* and *Application*, together with their attributes and operations, provide the terms for the business vocabulary. The Class *Rental System* processes the rules. To make *Rental System* process the rules, you add a **RULE FLOW ACTIVITY** as a behavior for this Class.

When you create a Rule Flow behavior (Activity) under a Class you can model the rules as *Rule Tasks* (Actions). When code is generated the rule flow behavior is rendered as a method inside the corresponding Class.

Alternatively, if you have existing operations in the Class that already suit the purpose, you can **model business rules in those operations**. When code is generated for the Class the rules logic is generated as the method body for the corresponding operation.

Notes:

- When you create Classes in the Business Domain model, select the correct language for code generation to ensure that the correct data type is set for attributes and operation parameters
- Business Rules code generation is supported for the following languages:
 - C++
 - C#
 - Java
 - VB.Net

Learn More:

- [Create a Rule Flow Activity](#)^[1206]
- [Model Rules in an Operation](#)^[1209]

8.3.3.3 Create a Rule Flow Model

You create a *Rule Flow Activity* as a behavior for a Class, to enable that Class to process a set of rules.

To add a Rule Flow Activity to a Class, follow the steps below

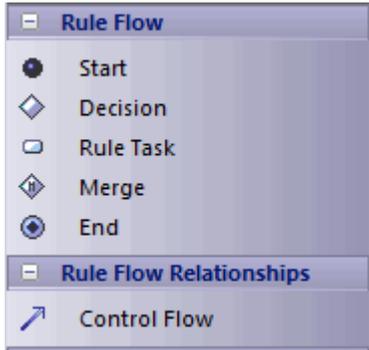

How To:

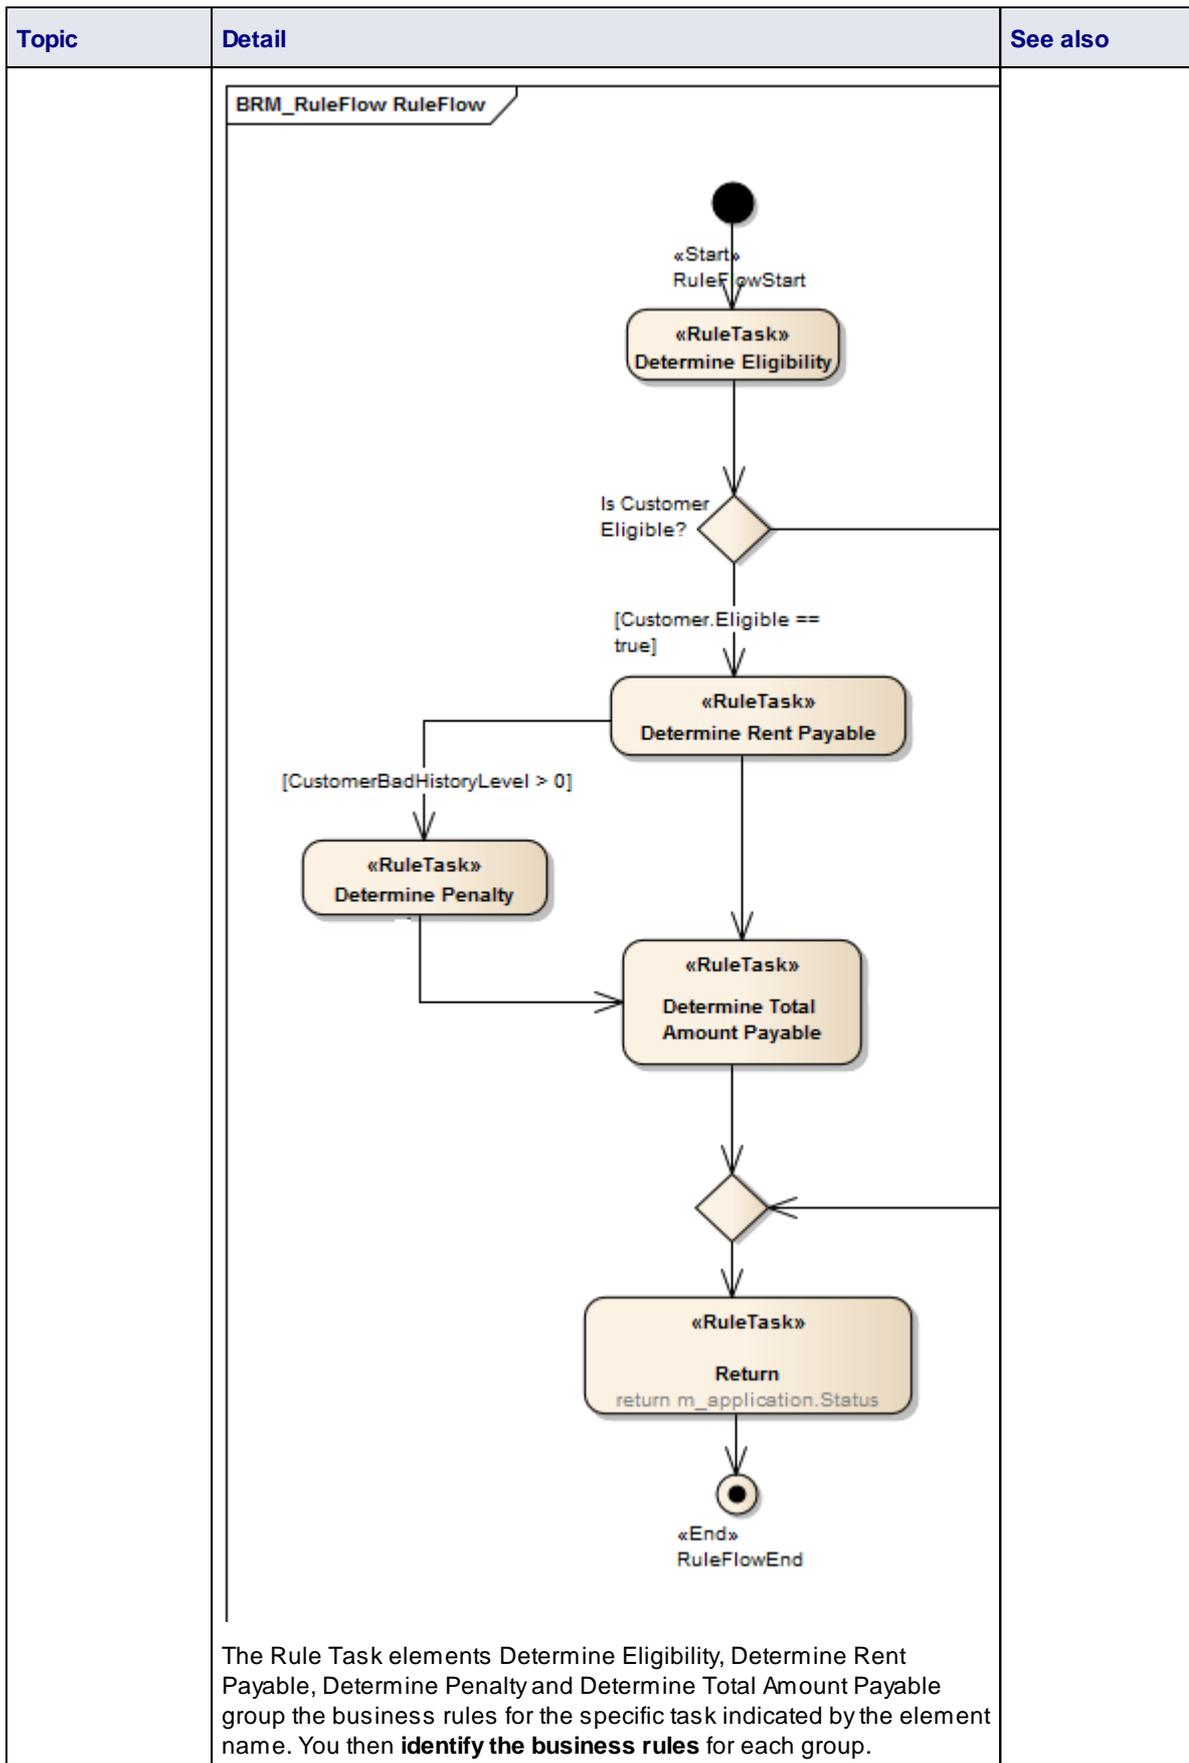

Step	Action	See Also
1	On the Business Domain model diagram, right-click on the Class that processes the rules (in the example, <i>Rental System</i>).	
2	From the context menu select the Add RuleFlow Activity menu option.	

A new Rule Flow Activity with a *Rule Flow diagram* is created as a behavior for the selected Class. The Rule Flow diagram models the sequence in which a series of *Rule Tasks* are executed.

Code generation for a Rule Flow model renders each RuleFlow Activity as a set of operations or methods. Depending on what you want these methods to do, you might want to pass in some parameters to be used within the Rule Flow Activity. See the **Pass Parameters to Rule Flow Activity** topic.

Topics:

Topic	Detail	See also
Add a Rule Task	<p>A Rule Task is a stereotyped Action that groups Business Rules for a specific task. You create Rule Task elements in a Rule Flow diagram using the associated Rule Flow pages of the Toolbox.</p>  <p>The following illustration is of a possible Rule Flow diagram for the car rental example.</p>	Model Business Rules ^[1202]

Notes:

- In a Rule Flow diagram, every Decision Node has a matching *Merge Node* to ensure proper code generation
- For code generation, the Rule Task elements must be grouped inside the appropriate Rule Flow Activity in the **Project Browser**. However, Rule elements can be defined anywhere in the model, as they can be used in more than one Rule Task

Learn More:

- [Pass Parameters to Rule Flow Activity](#)^[1208]

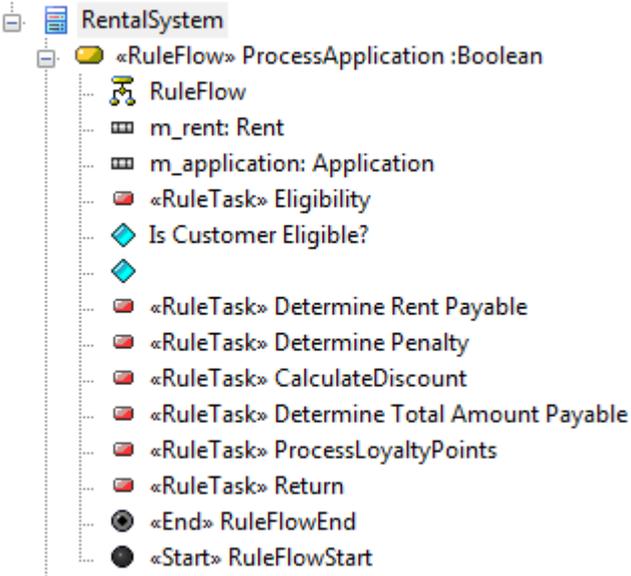

8.3.3.3.1 Pass Parameters to Rule Flow Activity**How To:**

To pass in parameters to be used within a Rule Flow Activity, follow the steps below:

Step	Action	See Also
1	In the Project Browser , double-click on the Rule Flow Activity The element Properties dialog displays	
2	Click on the Behavior tab	
3	Click on the Edit Parameters button The Parameters dialog displays	
4	Create and define each parameter, setting Type and Default values	Parameters Dialog ^[717]
5	Save each parameter and, when you have finished setting the parameters, close both dialogs	

Topics:

Topic	Detail	See also
Rule Flow Activity Parameters	The Rule Flow Activity parameters can be accessed by the Rule Tasks within the parent Rule Flow Activity. In the following hierarchy, the parameters <i>m_rent</i> and <i>m_application</i> can be used by any of the Rule Tasks under the <i>ProcessApplication</i> Rule Flow Activity.	Compose Business Rules ^[1217]

Topic	Detail	See also
	 <p>You can use the parameters as condition variables or action variables in the Business Rule Decision Table, or as rule variables in the Computation Table for any of the Rule Tasks. If the Activity parameter is not accessible to a Rule Task, Enterprise Architect displays an error message.</p>	

8.3.3.3.2 Model Rules In an Operation

You can model business rules either in the **Business Rule** elements attached to the Rule Task element in a **RuleFlow Activity** diagram, or in the operations of the rule Class in the **Business Domain model**.

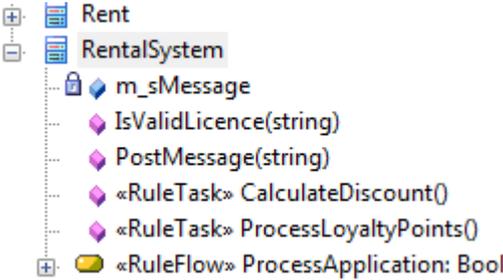

To model business rules for an operation:

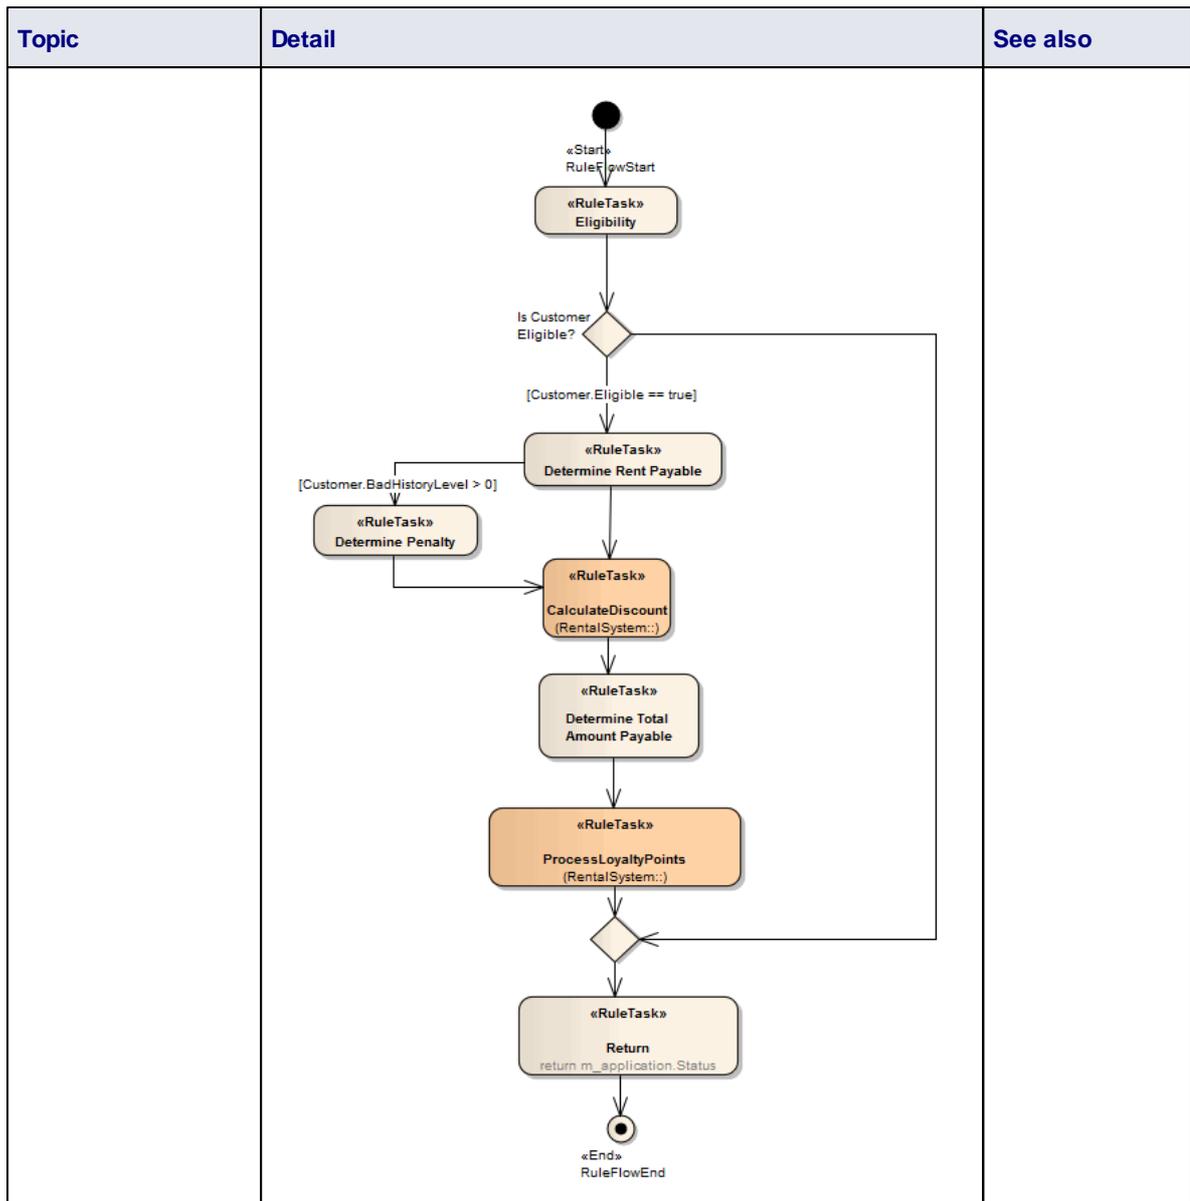

How To:

Step	Action	See Also
1	Open the Properties dialog for the operation and, in the Stereotype field on the General tab, type the value RuleTask	
2	In the Project Browser , right-click on the operation and select the Rule Composer option to open the Rule Composer	
3	Model the rules for the operation	Compose Business Rules 121

Topics:

Topic	Detail	See also
Usage	The operations appear in the Project Browser as shown below:	Behaviour Calls 715

Topic	Detail	See also
	 <p>On code generation, the code for rules logic is generated in the method body.</p> <p>When you drag and drop a RuleTask operation onto a Rule Flow diagram, an operation call behavior action is created. To pass the parameters for this operation call, open the Properties dialog and select the Call tab. Set the Behavior field to the operation to be called. Under the Arguments field, click on the Edit Arguments button and edit the argument values to be passed.</p> <p>On the diagram, the call behavior actions for the RuleTask operations are indicated as shown below:</p>	Behaviour Call Arguments ⁷¹⁶

- [Business Rules](#) ^[1202]
- [RuleFlow Activity Diagram](#) ^[1206]
- [Business Domain Model](#) ^[1204]

8.3.3.4 Compose Business Rules

You use the **Rule Composer** to define a business rule written in plain text within a Business Rule element or Class operation. The **Rule Composer** enables you to model conceptual-level business rules at a logical level in tabulated format, which assists in transforming the rules to technology-specific rules (code).

You can also **download** the contents of the **Rule Composer** to a spreadsheet application such as Microsoft Excel, via a **CSV** file.

Topics:

Topic	Detail	See also
Access The Rule Composer	<p>To access the Rule Composer, right click on a Rule Task element and select the Rule Composer context menu option. The Rule Composer displays in the central work area on its own tab.</p> <p>The Rule Composer consists of:</p> <ul style="list-style-type: none"> • a Rule Statements list • a Decision Table and • a Computation Rule Table <p>To assist with traceability, as the Rule Composer is completed, selections in one table automatically highlight the corresponding rows and columns of the other tables. For example, If a Rule Statement is selected, the related rule column in the Decision Table and row in the Computation Rule Table are highlighted. Similarly, if a Computational Rule is selected, the corresponding column in the Decision Table and row in the Rule Statements list are highlighted.</p>	
Rule Statements Table	<p>The Rule Statements table lists the rules associated with the selected Rule Task. You add a rule to the table by dragging an existing Business Rule element from the Project Browser onto an empty row in the Rule Statements table. You cannot create new rules within the table.</p>	
Decision Table	<p>The Decision Table enables you to model <i>conditional</i> rules (for example: <i>Cars must not be rented to customers of age less than 18</i>).</p> <p>The table has three sections:</p> <ul style="list-style-type: none"> • Rule Conditions – to model condition variables • Rule Actions – to model action variables • Rule Bindings – to link the rule in the rule table 	
Computation Rule Table	<p>The Computation Rule table enables you to model rules involving computations.</p> <p>The table has the following columns:</p> <ul style="list-style-type: none"> • Computation Rule Actions • Expression • Rule Bindings • Rule Dependency 	

How To:

To define a business rule associated with the selected Rule Task, follow the steps below

Step	Action	See Also
1	For the first rule, select the text within the Business Rule element and drag it onto the empty row.	
2	For a subsequent rule, click on the No column and select the Add Row context menu option. An empty row is added to the Rule Statements table.	

Step	Action	See Also
3	Drag the required Business Rule element from the Project Browser onto the new row. If the Business Rule element is not already on the diagram, this adds the element to the diagram and creates a Dependency relationship between the Business Rule and Rule Task elements.	

To remove a rule that is no longer required in the **Rule Composer**, right-click on the appropriate **No** field and select the **Remove Rule** context menu option. This removes the rule from the **Rule Composer** and deletes the Dependency relationship with the Rule Task element. However, it does not remove the Business Rule element from either the diagram or the **Project Browser** (where, in either case, it might be in use with other Rule Task elements).

To model Rule Conditions in the Rule Conditions Section, follow the steps below

Step	Action	See Also
1	The Business Domain model defines the business terms (such as <i>Customer</i>) and their associated attributes. From the appropriate Class element in the Project Browser , drag and drop the required condition attribute (such as age) or operation (such as <i>IsValidLicense()</i>) onto the Rule Conditions column. <ul style="list-style-type: none"> The Rule Condition field enables you to use intellisense to display a list of possible entries for the field. Press (Ctrl+Spacebar) in the field to display the list of entries If the Rule Condition is of type <i>enum</i>, the Allowable Values fields are automatically set with the <i>enum</i> literals. The procedure then ends here 	
2	Define a range of accepted values for the Rule Condition.	
3	Right-click on the Allowable Values column and select the Edit Allowable Values context menu option. The Edit Allowable Values dialog displays. Type each required value or range of values in the Value field, and click on the Save button to display the value in the Allowable Values list box; for example: age could have the values: <18 >18 and <50 >50 <i>IsValidLicense()</i> could return: True False	
4	Click on the OK button to save the values and close the dialog. A new constraint <i>AllowableValues</i> is created for the attribute. <ul style="list-style-type: none"> You can check this constraint by opening the Properties dialog for the attribute and selecting the Constraints tab If the Rule Condition references an enumeration, the enum literals are not editable in the Edit Allowable Values dialog 	
5	If the Rule Condition is an operation, you can pass parameters to it. Right click on the Allowable Values field, and select the Edit Parameters context menu option. The Edit Parameters dialog displays. Select the parameters	

Step	Action	See Also
	<p>and type their values into the Value text box. Click on the OK button to cancel the dialog.</p> <ul style="list-style-type: none"> You can add an operation as a Rule Condition more than once, to allow calling the operation with different sets of parameters. To add another Rule Condition, right-click on the No column and select the Add Row context menu option. An empty row is added to the table. <p>To remove a Rule Condition from the table, right-click on the appropriate No field and select the Delete Row context menu option. This does not affect the original attribute or <i>the new constraint</i> in the model. You can either re-use the attribute with its constraint, or use the attribute Properties dialog to remove the constraint.</p>	

To model Rule Actions in the Rule Actions section, follow the steps below:

Step	Action	See Also
1	<p>In the Rule Actions section, when a specific value of a Rule Condition calls an operation (such as <i>post error</i>) or decision attribute (such as <i>Eligible - Yes/No</i>), you assign the operation or attribute as an action.</p> <p>From a business term Class element in the Project Browser, drag and drop the required attribute or operation onto the Rule Actions field.</p> <p>The Rule Actions field enables you to use intellisense to display a list of possible entries for the field. Press (Ctrl+Spacebar) in the field to display the list of entries.</p>	
2	<p>For an attribute, double-click on the Allowable Values/Parameters field. The Edit Allowable Values dialog displays; type the range of values in the text box (such as Yes, No; or Accept, Reject), click on the Save button and close the dialog. Select the appropriate response in the Result column fields.</p> <p>If the dropped action variable is of type <i>enum</i>, the Allowable Values/Parameters fields are automatically set with the enum literals.</p>	
3	<p>For an operation, a checkbox displays in each of the Result column fields. To call the operation, select the checkbox in the appropriate column.</p> <p>To pass parameters to the operation, double-click on the Allowable Values/Parameters field. The Edit Parameters dialog displays. Select the parameters and type the values into the Value text box. Click on the Save button and close the dialog.</p> <p>You can add an operation as a Rule Action more than once, to allow calling the operation with different sets of parameters.</p>	
4	<p>Click on the Save button in the Rule Composer toolbar to save the values.</p> <p>Alternatively, you can <i>right-click</i> on an Allowable Values/Parameters field to display a context menu with two options:</p> <ul style="list-style-type: none"> If the Rule Action is an attribute, the Edit Allowable Values option is enabled and this displays the Edit Allowable Values dialog If the Rule Action is an operation, the Edit Parameters option is enabled and this displays the Edit Parameters dialog <p>To add another Rule Action, right-click on the No column and select the Add</p>	

Step	Action	See Also
	<p>Row context menu option. An empty row is added to the table.</p> <p>To remove a Rule Action from the table, right-click on the appropriate No field and select the Delete Row context menu option. This does not affect the original attribute or operation in the model.</p>	

To bind a rule in the Rule Bindings Section, follow the steps below

Step	Action	See Also
1	<p>The Rule Bindings section lies on top of the Rule Conditions section. It binds the Rule Condition and Rule Action values to the appropriate rule in the Rule Table.</p> <p>Select the rule number in the Rule Bindings field over one of the Value<n> or Result<n> columns.</p>	
2	<p>Ensure that the values set in the Value<n> or Result<n> field for the Rule Condition or Rule Action, underneath the rule number, all satisfy the rule.</p>	
3	<p>Click on the Save icon in the Rule Composer toolbar.</p> <p>For example, (referring to the screen diagram at the top of this <i>Rule Composer</i> topic) if rule 2 is <i>Car must not be rented to Customers of age less than 18</i>:</p> <ul style="list-style-type: none"> • Select 2 in the Rule field over the Value1 column • Select < 18 against <i>Customer.age</i> in the Value1 column in the Rule Conditions table • Select No against <i>Customer.Eligible</i> in the Result1 column in the Rule Action table • Select Reject against <i>Application.Status</i> in the Result1 column in the Rule Action table 	

To define a computation rule, follow the steps below:

Step	Action	See Also
1	<p>From the Project Browser, drag and drop the appropriate attribute from a Class in the <i>Fact</i> model into the Computation Rule Actions field.</p> <p>Both the Computation Rule Actions field and the Expression field enable you to use intellisense to display a list of possible entries for the fields. Press (Ctrl+Spacebar) in the field to display the list of entries.</p>	
2	<p>In the Expression field, type the expression to be evaluated.</p>	
3	<p>In the Rule Bindings field, type the rule number from the Rule table of the rule being modeled, to link the table data to the rule.</p>	
4	<p>If the rule depends on another rule being satisfied first, type the number of that rule in the Rule Dependency field.</p>	
5	<p>Click on the Save icon in the Rule Composer toolbar to save the computation rule.</p>	

Step	Action	See Also
	If the computation rule is also a Rule Conditions rule, add the condition variable in the Decision table and bind the appropriate rule in the Rule Bind section.	

To export the contents of the Rule Composer to a CSV file, follow the steps below

Step	Action	See Also
1	Click on the Export to CSV icon () in the Rule Composer toolbar. The Windows Browser dialog displays.	
2	Browse to the required file location and type in a .CSV filename to export to.	
3	Click on the Save button to export the data.

8.3.3.5 Validate Business Rules

Topics:

Topic	Detail	See also
Usage	<p>It is recommended practice to validate the business rules in the Rule Composer before you generate code for the Rule Task elements. To do this, click on the Validation (green tick) icon in the Rule Composer toolbar.</p>  <p>The business rules on the Rule Composer are parsed and any errors or warnings that might indicate incomplete or unfavorable code generation are displayed on a Rule Composer Validation tab on the Output screen.</p> <p>To highlight and investigate the faulty data in the Rule Composer, double-click on the appropriate warning or error message.</p>	

8.3.3.6 Code Generation For Business Rules

After you have modeled the business rules for all the Rule Task elements in the Rule Flow diagram, you can generate code from the Rule Flow behavior.

How To:

To return a value from the Rule Flow behavior, follow the steps below:

Step	Action	See Also
1	Double-click on the last Rule Task element before the end node of the Rule Flow diagram. The element's Properties dialog displays.	
2	Click on the Effect tab.	
3	In the Effect field, type the <i>return</i> statement; for example, <i>return true</i> .	
4	Click on the Save button, and on the OK button to close the dialog. Generate code for the Class containing the rule flow behavior (in our initial example, Rental System). The code for business rules logic is generated, with the rule statements expressed in natural language as comments.	Generate code for a single class ^[149] Create a Business Domain Model ^[120]

Example:

The following code snippet was generated from the *Rental System* Class element in our example:

```

////////////////////////////////////
// RentalSystem.cs
// Implementation of the Class RentalSystem
// Generated by Enterprise Architect
// Created on:      08-May-2009 2:39:23 PM
////////////////////////////////////

public class RentalSystem {

    public Customer m_Customer;
    public Car m_Car;
    public Rent m_Rent;

    public RentalSystem() {

    }

    ~RentalSystem() {

    }

    public virtual void Dispose() {

    }

    /* Begin - EA generated code for Activities and Interactions */
    public bool ProcessApplication(Rent m_rent, Application m_application)
    {
        // behavior is an Activity

        /* CAR MUST NOT BE RENTED TO CUSTOMERS W THOUT A VALID

```

```

LICENCE NUMBER*/
    if( m_Customer.ValidLicenceNumber == "FALSE" )
    {
        m_application.Status = "Reject";
        m_Customer.Eligible = false;
    }
/* CAR MUST NOT BE RENTED TO CUSTOMERS OF AGE LESS THAN
18*/
    if( m_Customer.age < 18 )
    {
        m_application.Status = "Reject";
        m_Customer.Eligible = false;
    }
/* CAR MUST NOT BE RENTED TO CUSTOMERS WITH BAD HISTORY
LEVEL 3*/
    if( m_Customer.BadHistoryLevel == 3 )
    {
        m_application.Status = "Reject";
        m_Customer.Eligible = false;
    }
    if ( Customer.Eligible == true)
    {
        /* RENT FOR SMALL CARS IS 80 AUD PER DAY*/
        if( m_Car.type == Small )
        {
            m_rent.Rent Per Day = 80;
        }
        /* RENT FOR AWD CARS IS 100 AUD PER DAY*/
        if( m_Car.type == AWD )
        {
            m_rent.Rent Per Day = 100;
        }
        /* RENT FOR LUXURY CARS IS 150 AUD PER DAY*/
        if( m_Car.type == Luxury )
        {
            m_rent.Rent Per Day = 150;
        }
        /* RENT PAYABLE IS CALCULATED AS THE PRODUCT OF
RENTPERDAY AND RENTALPERIOD IN DAYS*/
        m_rent.Rent Payable = m_rent.Rent Per Day * m_rent.
No_of_rent_days;
        if ( Customer.BadHistoryLevel > 0)
        {
            /* PENALTY OF 20 % OF RENT MUST BE APPLIED FOR
CUSTOMERS WITH BAD HISTORY LEVEL 2*/
            if( m_Customer.BadHistoryLevel == 2 )
            {
                m_rent.PenaltyFee = m_rent.Rent Payable
* 0.2;
            }
            /* PENALTY OF 10 % OF RENT MUST BE APPLIED FOR
CUSTOMERS WITH BAD HISTORY LEVEL 1*/
            if( m_Customer.BadHistoryLevel == 1 )
            {
                m_rent.PenaltyFee = m_rent.Rent Payable
* 0.1;
            }
        }
    }
else
{
}

/* TOTAL AMOUNT PAYABLE IS CALCULATED AS THE SUM OF
RENT PAYABLE AND PENALTY IF ANY.*/
    m_rent.Total Amount Payable = m_rent.Rent Per Day +
m_rent.PenaltyFee;
}
else

```

```

    {
    }
    return m_application.Status;
}

/* End - EA generated code for Activities and Interactions */

} // end Rental System

```

8.3.4 BPMN Models

The BPMN notation is specifically targeted at the business modeling community and has a direct mapping to UML through BPMN Profiles integrated with the Enterprise Architect installer. Through use of these profiles, Enterprise Architect enables you to develop BPMN diagrams quickly and simply.

The Enterprise Architect installer for releases later than 8.0 provides you with separate versions of the MDG Technology for BPMN that support BPMN versions 1.0, 1.1 and 2.0, and BPEL.

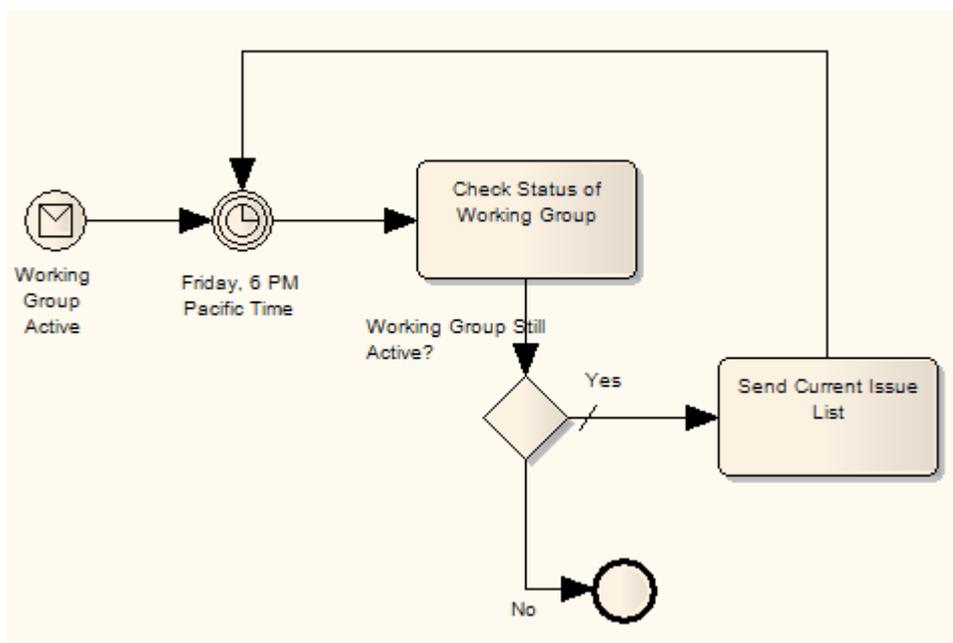

Use To:

- Maintain existing diagrams created in BPMN 1.0 format, and create new diagrams in BPMN 1.0
- Create and maintain diagrams in the BPMN 1.1 and BPEL formats
- Create and maintain diagrams in the BPMN 2.0 and BPEL formats
- Migrate a BPMN 1.0 model (or part of a model) to BPMN 1.1

Access: The BPMN facilities are provided in the form of:

- A BPMN diagram type, accessed through the New Diagram dialog
- BPMN pages in the Toolbox
- BPMN element and relationship entries in the Toolbox **Shortcut** menu and Quick Linker

Specifications of BPMN elements and relationships are defined by Tagged Values (for example, to define the *Message*, *Timer* and *Default Path (/)* symbols in the diagram below).

BPMN Toolbox Pages:

You can access the BPMN Toolbox pages through the **View | Toolbox: More tools...** option; select the **BPMN 1.0, 1.1** or **2.0** options as appropriate.

You can also set BPMN as the active default technology to access the Toolbox pages directly.

Disable BPMN:

If you prefer not to use BPMN in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (**Settings | MDG Technologies**).

8.3.4.1 BPMN 1.0 and 1.1 Toolbox Pages

The BPMN 1.0 and BPMN 1.1 pages of the Diagram Toolbox enable you to create graphical (Core) and non-graphical (Types) BPMN elements and relationships on business process diagrams in BPMN 1.0, BPMN 1.1 and BPEL formats.

Access: **View | Toolbox: More tools | BPMN 1.0**
View | Toolbox: More tools | BPMN 1.1

The elements and relationships available are shown below, and described in the following table.

Example:

Page	Item	Action
Core	Business Process	Extend a <i>composite Activity</i> that defines a business process
	BPEL Process	Define the behavior of an executable or abstract business process
	Activity	Define an activity within a business process
	Start Event	Define the initiating event in a process
	Intermediate Event	Define an intermediate event in a process
	End Event	Define the terminating event in a process
	Gateway	Define a decision point in a business process If a condition is true , then processing continues one way; if not, then another
	Pool	Extend a <i>Partition</i> element to logically organize an Activity
	Lane	Extend a <i>Partition</i> element to subdivide a Pool

Page	Item	Action
	Data Object	Extend an <i>Artifact</i> element to define a physical piece of information used or produced by a system
	Group	Extend a <i>Boundary</i> element to group other elements
	Text Annotation	Create a comment
Relationships	Sequence Flow	Extend a <i>Control Flow</i> relationship to define the flow of activity
	Message Flow	Extend a <i>Control Flow</i> relationship to define the flow of communications in the process
	Association	Associate information and artifacts with flow objects
Types	Assignment	Define the <i>properties</i> (Tagged Values) of the Core BPMN 1.1 elements such as Activities, Events and Gates
	Condition	
	Message	
	Participant	
	Signal	
	Rule	
	Transaction	
	Web Service	
	Property	

8.3.4.2 BPMN 2.0 Toolbox Pages

The BPMN 2.0 pages of the Diagram Toolbox enable you to create BPMN elements and relationships on business process diagrams in BPMN 2.0 and BPEL formats.

Access: [View](#) | [Toolbox: More tools](#) | [BPMN 2.0](#)

Enterprise Architect provides a set of pages for each of the following BPMN 2.0 diagram types:

Topic	Link
Business Process - contains the constructs needed to build Business Process models (and, effectively, Collaboration models)	Business Process ^[1222]
Choreography - contains the constructs needed to build Choreography models	Choreography ^[1224]
Conversation - contains the constructs needed to build Conversation models	Conversation ^[1225]
Types - contains the constructs common to all BPMN 2.0 diagrams	Type ^[1227]

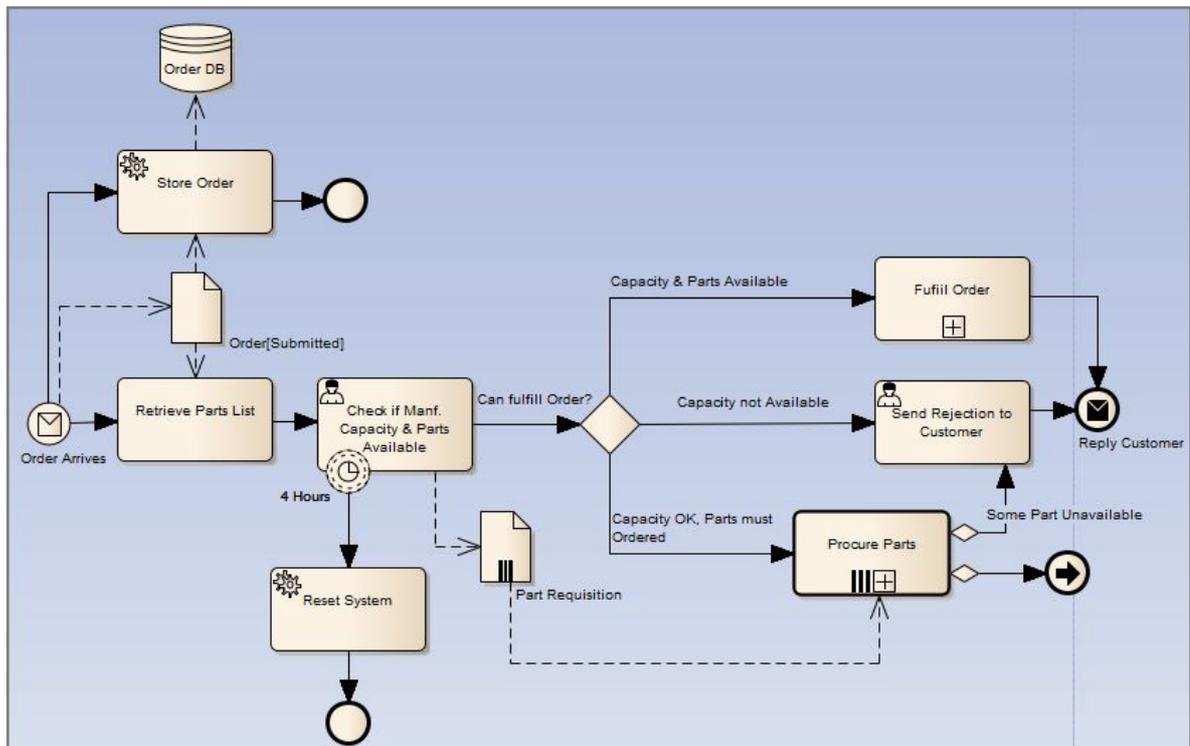

8.3.4.2.1 BPMN 2.0 Business Process Toolbox Pages

The BPMN 2.0 Business Process pages of the Diagram Toolbox enable you to create BPMN elements and relationships on business process diagrams in BPMN 2.0 and BPEL formats.

Access: [View](#) | [Toolbox: More tools](#) | [BPMN 2.0](#) | [BPMN 2.0 Business Process](#)

Page	Item	Use to
BPMN 2.0 Business Process	Business Process	Extend a composite Activity that defines a business process
	BPEL	Define the behavior of an executable or abstract business process
	Activity	Define an activity within a business process
	Choreography	Extend an Activity element to represent a process unit of information exchange between Participants Enterprise Architect currently supports two to four participant bands within one Choreography Activity/Task
	Conversation	Extend a Class element to group a set of Message Flows together based on a certain concept
	Data Object	Provide or store the information for an Activity
	Data Store	Represent a mechanism for an Activity to retrieve or update stored information
	Start Event	Define the initiating event in a process
	Intermediate Event	Define an intermediate event in a process
	End Event	Define the terminating event in a process
	Gateway	Define a decision point in a business process If a condition is true then processing continues one way; if false , then another
	Pool	Extend a Partition element to logically organize an Activity
	Lane	Extend a Partition element to subdivide a Pool
	Message	Represent the contents of a communication between two Participants
	Group	Extend a Boundary element to group other elements
Text Annotation	Create a comment	
BPMN 2.0 Business Process Connectors	Sequence Flow	Extend a Control Flow relationship to define the flow of activity
	Message Flow	Extend a Control Flow relationship to define the flow of communications in the process
	Data Association	Move data between Data Objects, Data Store, Properties and Activities, Processes
	Association	Link the information and Artifacts with BPMN graphic elements
	Conversation Link	Connect a Conversation Node with a Participant, in either direction

Example of a BPMN 2.0 Business Process Diagram:

Notes

- The appearance and specification of some elements and connectors are defined by Tagged Values

Learn More:

- [Change BPMN Element Appearance](#) ^[1226]

8.3.4.2.2 BPMN 2.0 Choreography Toolbox Pages

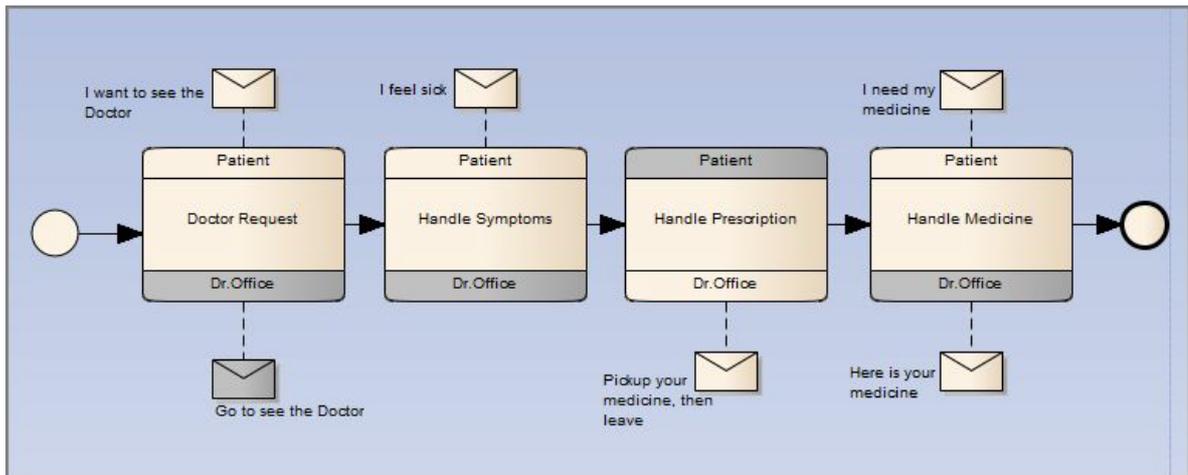

The BPMN 2.0 Choreography pages of the Diagram Toolbox enable you to create BPMN elements and relationships on Choreography diagrams in BPMN 2.0 and BPEL formats.

Access: [View](#) | [Toolbox: More tools](#) | [BPMN 2.0](#) | [BPMN 2.0 Choreography](#)

Page	Item	Use to
BPMN 2.0 Choreography	Choreography Model	Extend a composite Activity that defines a Choreography process
	Choreography	Extend an Activity element to represent a process unit of information exchange between Participants Enterprise Architect currently supports two to four participant bands within one Choreography Activity/Task
	Start Event	Define the initiating event in a process
	Intermediate Event	Define an intermediate event in a process
	End Event	Define the terminating event in a process

Page	Item	Use to
	Gateway	Define a decision point in a business process If a condition is true then processing continues one way; if false , then another
	Message	Represent the contents of a communication between two Participants
	Pool	Extend a Partition element to logically organize an Activity
	Text Annotation	Create a comment
BPMN 2.0 Choreography Connectors	Sequence Flow	Define the order of activity in a Choreography
	Association	Link the information and Artifacts with BPMN graphic elements
	Message Flow	Extend a Control Flow relationship to define the flow of communications in the process

Example of a BPMN 2.0 Choreography Diagram:

Notes

- The appearance and specification of some elements and connectors are defined by Tagged Values

Learn More:

- [Change BPMN Element Appearance](#)^[1228]

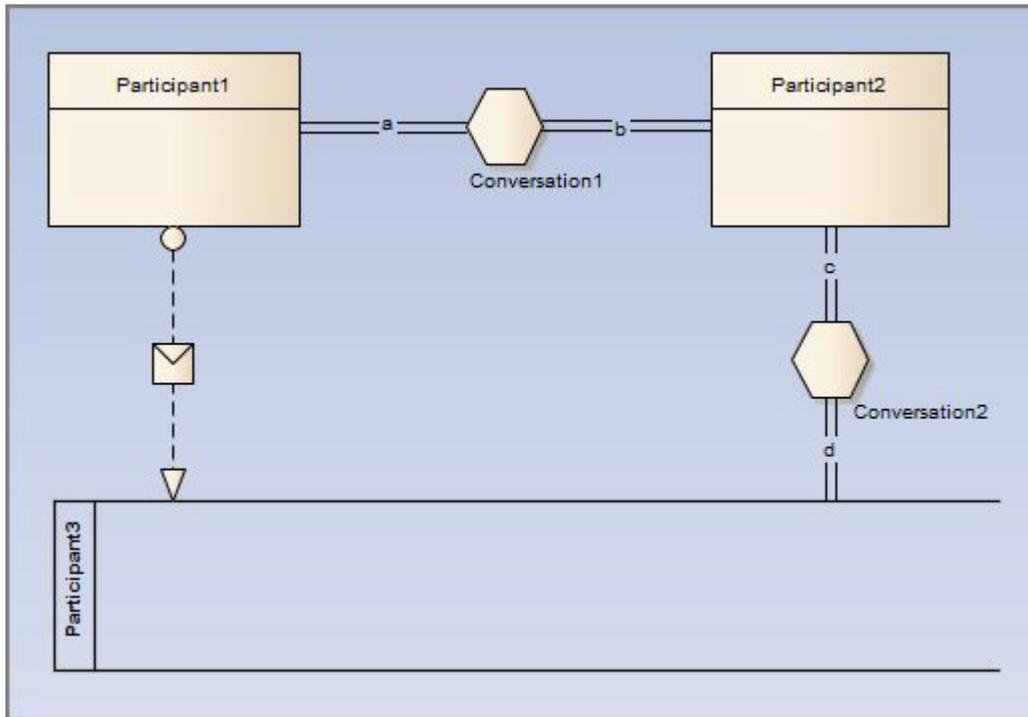

8.3.4.2.3 BPMN 2.0 Conversation Toolbox Pages

The BPMN 2.0 Conversation pages of the Diagram Toolbox enable you to create BPMN elements and relationships on Conversation diagrams in BPMN 2.0 and BPEL formats.

Access: [View](#) | [Toolbox: More tools](#) | [BPMN 2.0](#) | [BPMN 2.0 Conversation](#)

Page	Item	Use to
BPMN 2.0 Conversation	Conversation Model	Extend a composite Activity that defines the logical relationship of Message exchanges between two or more business entities
	Conversation	Extend a Class element to group a set of Message Flows together based on a certain concept
	Participant	Represent a specific organization or individual that is involved in a business process
	Pool	Extend a Partition element to logically organize an Activity
	Activity	Define an activity within a business process
	Start Event	Define the initiating event in a process
	Intermediate Event	Define an intermediate event in a process
	End Event	Define the terminating event in a process
	Gateway	Define a decision point in a business process If a condition is true then processing continues one way; if false , then another
	Text Annotation	Create a comment
BPMN 2.0 Conversation Connectors	Conversation Link	Connect a Conversation Node to or from a Participant
	Message Flow	Extend a Control Flow relationship to define the flow of communications in the process
	Sequence Flow	Extend a Control Flow relationship to define the flow of activity
	Association	Link the information and artifacts with BPMN graphic elements

Example of a BPMN 2.0 Conversation Diagram:

Notes

- The appearance and specification of some elements and connectors are defined by Tagged Values

Learn More:

- [Change BPMN Element Appearance](#) 

8.3.4.2.4 BPMN 2.0 Type Toolbox Page

The BPMN 2.0 Types page of the Diagram Toolbox is common to all BPMN 2.0 diagrams.

Access: [View](#) | [Toolbox: More tools](#) | [BPMN 2.0](#) | [BPMN 2.0 <diagram type>](#)

Page	Item	Use To
BPMN 2.0 Types	Assignment	Define the non-graphic elements or properties (Tagged Values) of the Core BPMN 2.0 graphic elements
	Correlation Key	
	Correlation Property	
	Correlation Property Binding	
	Correlation Property Retrieval	
	Correlation Subscription	
	Complex Behavior Definition	

Page	Item	Use To

	Property	
	Participant Association	
	Conversation Association	

8.3.4.3 Change BPMN Element Appearance

A number of Tagged Values directly affect the appearance of the BPMN element or relationship they apply to. Therefore, by changing the value of the tag you can change the appearance of the object.

Access: [View | Tagged Values](#)

How To:

To define the appearance of BPMN elements and relationships, follow the steps below:

Step	Action	See Also
1	Open the Tagged Values window	Tagged Values [762]
2	Select the required element or relationship in a diagram The Tagged Values window shows the appropriate Tagged Values and provides a list of values to assign to each one	
3	Set the required value, based on the value descriptions in the table below	

Reference:

Element	Tags	Values Setting
Activity	<i>activityType</i>	Set to: <ul style="list-style-type: none"> • Task for no decoration • Sub-Process to display the <i>plus-in-box</i> decoration on the bottom edge of the shape
	<i>adHoc</i>	Set to true to display the <i>tilde</i> decoration on the bottom edge of the shape, indicating that this is an ad-hoc Activity
	<i>adHocOrdering</i>	Set to: <ul style="list-style-type: none"> • Parallel to display three vertical lines on the bottom edge of the shape • Sequential to display three horizontal lines on the bottom edge of the shape • Unspecified to display no lines on the bottom edge of the shape The <i>adHoc</i> tag must first be set to true
	<i>isACallActivity</i>	Set to true to show the boundary of the Activity element as a thick line, indicating that this is a Call Activity
	<i>isATransaction</i>	Set to true to give the Activity element a double-lined border, indicating that this is a Transaction
	<i>isForCompensation</i>	Set to true to display the <i>rewind</i> icon on the bottom edge of the shape, indicating that this is a Compensation Activity
	<i>isSequential</i>	Set to true to display three horizontal bars on the bottom edge of the shape The <i>loopCharacteristics</i> tag must first be set to Multinstance
	<i>loopCharacteristics</i>	Set to: <ul style="list-style-type: none"> • Standard to display three vertical bars at the bottom edge of the shape • Multinstance to display a loop icon at the bottom edge of the shape
	<i>taskType</i>	When set to different value, the associated decoration is displayed at the top-left corner of the shape
<i>triggeredByEvent</i>	Set to true to show the boundary of the Activity element as a dotted line	
Choreography	<i>choreographyType</i>	Set to: <ul style="list-style-type: none"> • Task for no decoration • Sub-Process to display the <i>plus-in-box</i> decoration on the bottom edge of the shape
	<i>initiatingParticipant</i>	Set a value to show the corresponding participant band in a light color, which indicates that this is the initiating participant
	<i>isACallChoreography</i>	Set to true show the boundary of the Choreography element as

Element	Tags	Values Setting
		a thick line
	<i>loopType</i>	Set to: <ul style="list-style-type: none"> • Standard to display three vertical bars at the bottom edge of the shape • Multilinstance to display a loop icon at the bottom edge of the shape Each Participant has its own Multilinstance setting
	<i>numberOfParticipants</i>	Set to the appropriate numerical value to indicate the number of Participant bands for a choreography Activity or Task
	<i>participantA</i> or <i>participantARef</i>	<i>participantA</i> - Type the name of the Participant to show on the Participant band of the Choreography If the Participant is known and referenced, use the <i>participantARef</i> tag and leave the <i>participantA</i> tag blank; the name of the referenced Participant is shown on the Participant band of the Choreography The same usage is applied to other Participant bands
Conversation	<i>isACallConversation</i>	Set to true to show the boundary of the Conversation element as a thick line
	<i>isComposite</i>	Set to true to display a <i>plus-in-box</i> decoration on the bottom edge of the shape, indicating that the Conversation is a composite element
Data Object	<i>dataInOut</i>	Set to: <ul style="list-style-type: none"> • Input to add a light-colored arrow at the top-left corner of the Data Object, indicating that it represents a Data Input element • Output to add a dark-colored arrow at the top-left corner of the Data Object, indicating that it represents a Data Output element
	<i>isCollection</i>	Set to true to add three vertical lines at the bottom edge of the shape, indicating that the object is a collection
Event	<i>cancelActivity</i>	For Intermediate Event only Set to false to show the Intermediate Event border as a dashed line
	<i>catchOrThrow</i>	For Intermediate Event only Set to: <ul style="list-style-type: none"> • Catch or • Throw
	<i>eventDefinition</i>	Use to change the decoration of a Start Event, Intermediate Event or End Event
	<i>isInterrupting</i>	For Start Event only Set to false to show the border of the Start Event as a dashed line, indicating that the Start Event is not an interrupting event

Element	Tags	Values Setting
Gateway	<i>eventGatewayType</i>	Use to define two types of Event-based Gateway: <ul style="list-style-type: none"> • Exclusive and • Parallel
	<i>gatewayType</i>	Set to: <ul style="list-style-type: none"> • Exclusive to render the Gateway as a diamond shape without any marker in the middle; if you also set the <i>markerVisible</i> tag to true, the Gateway is rendered as a diamond shape with an X inside • Complex to render the Gateway as a diamond shape with an asterisk (*) inside • Inclusive to render the Gateway as a diamond shape with a circle (o) inside • Parallel to render the Gateway as a diamond shape with a plus (+) inside • Event to define the Gateway as Event-based
	<i>instantiate</i>	Use only to define the Exclusive and Parallel Event-based Gateway
Message	<i>IsInitiate</i>	Set to true to make the envelope color gray, indicating that this is an initiating Message
Message Flow	<i>messageVisible</i>	<ul style="list-style-type: none"> • Set to Unspecified to make the Message Flow connector without decoration • Set to Initiating to add a white envelope to the Message Flow connector • Set to Non-Initiating to add a gray envelope to the Message Flow connector
Participant	<i>participantMultiplicity</i>	Set to true to display three vertical bars at the bottom edge of a rectangle Pool element. Participant is rendered as a normal UML Class shape exclusively on Conversation diagrams
Pool	<i>blackBoxPool</i>	Set to true to render the Pool element as a rectangle, which is used in a Main Pool diagram
	<i>participantMultiplicity</i>	Set to true to display three vertical bars at the bottom edge of a rectangle Pool element
Sequence Flow	<i>conditionType</i>	<ul style="list-style-type: none"> • Set to Expression to show an unfilled diamond marker at the source end of the connector • Set to Default to show a slash marker at the source end of the connector

Notes:

- Some BPMN elements changed in appearance between BPMN version 1.0 and BPMN version 1.1
- In Enterprise Architect releases later than 7.1, if you work on a BPMN 1.0 model created in an earlier release, existing elements default to their version 1.0 appearance; new elements assume the BPMN version 1.1 appearance and automatically have a Tagged Value BPMNVersion set to 1.1
- If you want a new element to revert to the BPMN version 1.0 appearance, set the BPMNVersion Tagged Value to 1.0
- Conversely, if you want an older element to assume the BPMN version 1.1 appearance, assign the BPMNVersion Tagged Value to it, with the value 1.1

8.3.4.4 Migrate BPMN 1.0 Model to BPMN 1.1

Enterprise Architect enables you to migrate a BPMN 1.0 model (or part of a model) to BPMN 1.1 or BPMN1.1::BPEL, using the Automation Interface. There are two functions you can use:

- *MigrateToBPMN11()*
 - `proj.MigrateToBPMN11 sGUID, "BPMN"`
 - `proj.MigrateToBPMN11 sGUID, "BPEL"`
- *Migrate()*
 - `proj.Migrate sGUID, "BPMN", "BPMN1.1"`
 - `proj.Migrate sGUID, "BPMN", "BPMN1.1::BPEL"`

These functions update the Tagged Values and, if required, stereotypes to BPMN 1.1 for all elements, attributes, connectors and diagrams under the selected package or element.

Example:

The following VB script calls the *MigrateToBPMN11()* function to migrate the Tagged Values to BPMN 1.1:

```
Sub MigrateElement (sGUID, lngPackageID)

    Dim proj as EA.Project
    set proj = Repository.GetProjectInterface
    proj.MigrateToBPMN11 sGUID, "BPMN"

    'refresh the model
    If lngPackageID <> 0 Then
        Repository.RefreshModelView (lngPackageID)
    End If

End Sub

Sub MigrateSelectedItem

    Dim selType
    Dim selElement as EA.Element
    Dim selPackage as EA.Package

    selType = GetTreeSelectedItemType

    If selType = 4 Then 'means Element
        set selElement = GetTreeSelectedObject
        MigrateElement selElement.ElementGUID, selElement.PackageID
        MsgBox "Complete", 0, "BPMN 1.1 Migration"

    ElseIf selType = 5 Then 'means Package
        set selPackage = GetTreeSelectedObject
        MigrateElement selPackage.PackageGUID, selPackage.PackageID
        MsgBox "Complete", 0, "BPMN 1.1 Migration"

    Else
        MsgBox "Select a Package or Element in the Project Browser to
        initiate migration", 0, "BPMN 1.1 Migration"

    End If

End Sub

Sub Main

    MigrateSelectedItem

End Sub

Main
```

Notes:

- In BPMN 1.0, various tags have free-text direct-entry value fields, and you can provide additional information on these tags in the Tagged Value Note dialog, for display at the bottom of the Tagged Values window

In BPMN 1.1, some of these tags (such as the *Categories* tag on a *BusinessProcess* stereotyped element) have been changed to memo type, and you use the Tagged Value Note dialog to enter the value; therefore, you cannot have additional notes for these tags, all information must be within the tag's value

- For such tags, when migrating from BPMN 1.0 to BPMN 1.1, the BPMN 1.0 tag value is moved into the BPMN 1.1 tag notes field and the BPMN 1.0 tag notes are discarded; if you want to preserve the tag notes text, take a copy of the BPMN 1.0 model before migration to enable you to copy the tag notes text into the tag value after migration

Learn More:

- [MigrateToBPMN11\(\)](#)^[1942]
- [Migrate\(\)](#)^[1942]

8.3.4.5 Migrate BPMN 1.1 Model to BPMN 2.0

Enterprise Architect enables you to migrate a BPMN 1.1 model (or part of a model) to BPMN 2.0, using the Automation Interface function *Migrate()*. This function updates the Tagged Values and, if required, stereotypes to BPMN 2.0 for all elements, attributes, connectors and diagrams under the selected package or element.

Example:

The following VB script calls the *Migrate()* function to migrate the package or element to BPMN 2.0:

```
Sub MigrateElement (sGUID, lngPackageID)
    Dim proj as EA.Project
    set proj = Repository.GetProjectInterface
    proj.Migrate sGUID, "BPMN1.1", "BPMN2.0"

    'refresh the model
    If lngPackageID > 0 Then
        Repository.RefreshModelView (lngPackageID)
    End If
End Sub

Sub MigrateSelectedItem
    Dim selType
    Dim selElement as EA.Element
    Dim selPackage as EA.Package
    selType = GetTreeSelectedItemType
    If selType = 4 Then 'means Element
        set selElement = GetTreeSelectedObject
        MigrateElement selElement.ElementGUID, selElement.PackageID
        MsgBox "Element Migration Completed", 0, "BPMN 2.0 Migration"
    ElseIf selType = 5 Then 'means Package
        set selPackage = GetTreeSelectedObject
        MigrateElement selPackage.PackageGUID, selPackage.PackageID
        MsgBox "Package Migration Completed", 0, "BPMN 2.0 Migration"
    Else
        MsgBox "Select a Package or Element in the Project Browser to
        initiate migration", 0, "BPMN 2.0 Migration"
    End If
End Sub

Sub Main
```

```

    MigrateSelectedItem
End Sub

```

```

Main

```

Notes:

- Please backup your project before you run the BPMN 2.0 Migrator
- Normalization occurs on the following tags:
 - BPMN1.1::Activity::InMessageRef
 - BPMN1.1::Activity::OutMessageRef
 - BPMN1.1::Activity::IORules
 - BPMN1.1::Activity::InputSets
 - BPMN1.1::Activity::OutputSets
 - BPMN1.1::Activity::ComplexML_FlowCondition
 - BPMN1.1::Activity::Performers
 - BPMN1.1::BusinessProcess::InputSets
 - BPMN1.1::BusinessProcess::OutputSets
 - BPMN1.1::BusinessProcess::Performers
 - BPMN1.1::EndEvent::ErrorCode
 - BPMN1.1::IntermediateEvent::ErrorCode

Taking *BPMN1.1::Activity::InMessageRef* as an example, the following steps take place:

- (1) Create a new element *BPMN2.0::Operation*
- (2) Insert the reference tag *BPMN2.0::Activity::operationRef*
- (3) Migrate *BPMN1.1::Activity::InMessageRef* to *BPMN2.0::Operation::InMessageRef*

- Denormalization occurs on the following tags:
 - BPMN1.1::Transaction::TransactionProtocol
 - BPMN1.1::WebService::Operation
 - BPMN1.1::WebService::Interface
 - BPMN1.1::WebService::ParticipantRef
 - BPMN1.1::Condition::ConditionExpression
 - BPMN1.1::BPELProcess::InputSets
 - BPMN1.1::BPELProcess::OutputSets

Taking *BPMN1.1::Transaction::TransactionMethod* as an example, the following steps take place:

- (1) Find element *BPMN1.1::Transaction* by '*BPMN1.1::Transaction::TransactionProtocol*
- (2) Migrate *BPMN1.1::Transaction::TransactionMethod* to *BPMN2.0::transactionMethod*
- (3) Migrate *BPMN1.1::Transaction::TransactionProtocol* to *BPMN2.0::transactionProtocol*

- If a BPMN1.1 stereo tag is discarded in BPMN2.0, it is preserved if the tag has a value

Learn More:

- [Migrate\(\)](#)^[1942]

8.3.4.6 BPMN 2.0 XML

Enterprise Architect supports serializing **BPMN 2.0 Models** in **BPMN 2.0 XML**. The serialized XML file contains both the model semantics as well as the diagram-interchange information.

Access: Click on a package in the Project Browser, then:

Project | Model Publisher

**Project | Model Import/Export | Export Package to XMI File: Publish, or
Right-click | Import/Export | Export Package to XMI: Publish**

How To:

Step	Action	See Also
1	Open the Publish Model Package dialog	Publish Model Package [32]
2	In the XML Type field, select BPMN 2.0 XML	
3	Click on the Export button to initiate the BPMN 2.0 XML serialization	

Notes:

1. The package being serialized is assumed to be self-contained
2. Only the contents of the selected package are considered for serialization - child packages (and their contents) are ignored
3. Serialization of the *Group* element in the BPMN 2.0 Business Process Tool-box is not supported
4. Serialization of the following items in the BPMN 2.0 Types section of the Tool-box is not supported :
 - *InputOutputBinding*
 - *Participant Association*
 - *Conversation Association*

Learn More:

- [XML Schema for BPMN 2.0 XML](#) (Online Resource)
- [BPMN 2.0 Toolbox Pages](#) [1222]

8.3.5 BPEL Models

The following text is derived from the **BPEL** entry in the online Wikipedia:

Business Process Execution Language (BPEL), short for **Web Services Business Process Execution Language (WS-BPEL)**, is an executable language for specifying interactions with **Web Services**. Processes in Business Process Execution Language export and import information by using Web Service interfaces exclusively.

Web service interactions can be described in two ways :

1. Executable business processes, which model the actual behavior of a participant in a business interaction.
2. Abstract business processes, which are partially specified processes that are not intended to be executed. An Abstract Process may hide some of the required concrete operational details.

BPEL is an **Orchestration** language, serialized in XML, which specifies an executable process that involves message exchanges with other systems. This messaging facility depends on the use of the **Web Services Description Language (WSDL) 1.1** to describe outgoing and incoming messages.

BPEL in Enterprise Architect:

Enterprise Architect supports generating **BPEL** from executable processes in the **Business and Software Engineering** and the **Ultimate** editions. Although there is no standard graphical notation for **WS-BPEL**, Enterprise Architect uses **BPMN** profile as a graphical front-end to capture **BPEL** Process descriptions. With the help of the **BPMN** Profile, Enterprise Architect enables you to develop **BPEL** diagrams quickly and simply.

While **BPMN** provides a graphical notation for visualizing business process, **BPEL** provides a way for visualizing this graphical business process in XML.

Enterprise Architect supports generating:

- BPEL 1.1 [\[1238\]](#) from models created using constructs in BPMN 1.1 Profile
- BPEL 2.0 [\[1254\]](#) from models created using constructs in BPMN 2.0 Profile

Notes:

- BPEL is supported in the **Business and Software Engineering** and the **Ultimate** editions of Enterprise Architect.
- Enable BPMN 1.1 Technology for BPEL 1.1 and BPMN 2.0 Technology for BPEL 2.0 modeling in the MDG Technologies dialog (**Settings | MDG Technologies**).

Learn More:

- [BPEL](#) (Online Resource)
- [Orchestration](#) (Online Resource)
- [BPEL 1.1 Model](#) [\[1236\]](#)
- [BPEL 2.0 Model](#) [\[1254\]](#)
- [BPMN Model](#) [\[1219\]](#)

8.3.5.1 BPEL 1.1 Model

Enterprise Architect uses **BPMN 1.1** as a graphical front-end to capture **BPEL 1.1** Process description (as **BPEL 1.1** does not have not a standard graphical notation). Enterprise Architect uses the partial mapping specified in the **OMG BPMN 1.1** specification to map **BPMN 1.1** constructs to **BPEL 1.1**.

Step	Action	See Also										
1	<p>Create a BPEL 1.1 Package Structure</p> <p>Alternative:</p> <table border="1"> <thead> <tr> <th>Step</th> <th>Action</th> </tr> </thead> <tbody> <tr> <td>a</td> <td>Create a package in the Project Browser</td> </tr> <tr> <td>b</td> <td>Click on the New Diagram icon in the Project Browser</td> </tr> <tr> <td>c</td> <td>Select BPMN 1.1 in the Select From field and BPEL in the Diagram</td> </tr> <tr> <td>d</td> <td>Click on the BPEL Process icon from the BPMN 1.1 Core toolbox at the created BPEL diagram</td> </tr> </tbody> </table>	Step	Action	a	Create a package in the Project Browser	b	Click on the New Diagram icon in the Project Browser	c	Select BPMN 1.1 in the Select From field and BPEL in the Diagram	d	Click on the BPEL Process icon from the BPMN 1.1 Core toolbox at the created BPEL diagram	<p>BPEL 1.1 Package Structure [1238]</p> <p>Project Browser Toolbar [452]</p>
Step	Action											
a	Create a package in the Project Browser											
b	Click on the New Diagram icon in the Project Browser											
c	Select BPMN 1.1 in the Select From field and BPEL in the Diagram											
d	Click on the BPEL Process icon from the BPMN 1.1 Core toolbox at the created BPEL diagram											
2	Open the BPEL diagram under the <i>BPELProcess</i> stereotyped element											
3	<p>Model the <i>BPEL Process</i> using the constructs in the BPMN 1.1 Core toolbox. Use the following constructs in this toolbox to model BPEL 1.1:</p> <p>BPMN 1.1 - Core page:</p> <ul style="list-style-type: none"> • BPEL Process • Activity • Start Event • Intermediate Event 	<p>BPMN 1.1 Core Toolbox [1220]</p> <p>Model BPEL 1.1 Process [1246]</p>										

	<ul style="list-style-type: none"> • End Event • Gateway • Pool <p>BPMN 1.1 - Relationships page:</p> <ul style="list-style-type: none"> • Sequence Flow • Message Flow • Association <p>BPMN 1.1 Types page:</p> <ul style="list-style-type: none"> • Assignment • Condition • Message • Participant • Web Service 	
4	Create Web Service for the <i>BPEL Process</i> and other related <i>Pools</i> , if required	BPEL Web Service <small>[125]</small>
5	Generate BPEL 1.1 code from the <i>BPEL Process</i>	Generate BPEL 1.1 <small>[125]</small>

Notes:

- Generating **BPEL 1.1** from a **BPMN 1.1** model is supported in the **Business and Software Engineering** and the **Ultimate** editions of Enterprise Architect.
- Ensure that **BPMN 1.1** Technology is enabled in the **MDG Technologies** dialog (**Settings | MDG Technologies**).

BPEL 1.1 Example:

- The Enterprise Architect Example file (**EAExample.EAP**) has a sample **BPMN 1.1** model from which **BPEL 1.1** can be generated.
- If you have installed Enterprise Architect at the default location, open this file: **C:\Program Files\Sparx Systems\EA\EAExample.EAP**
- The **BPMN 1.1** model package is in: **Project Models | Analysis and Business Modeling | BPEL Example | BPEL 1.1 Model**.

Modeling Restrictions:

1. Every *BPEL Process* and *Sub-Process* should start with a *Start Event* and end with an *End Event*.
 - A *Start Event* or an *End Event* should not be attached to the boundary of a *Sub-Process*.
2. *Sequence Flow* Looping is not supported - only *Activity* looping is supported. All *Sequence Flows* should flow downstream and not upstream.
3. Mapping of an *Intermediate Event* with multiple triggers to **BPEL 1.1** is not supported.
4. Mapping of *Multi-Instance Parallel While* loops to **BPEL 1.1** is not supported.
5. Mapping of *Independent Sub-Process* to **BPEL 1.1** is not supported.
6. *Pools* are treated as *black box* (i.e., they do not expose any details) and hence they cannot contain any child elements or have any incoming/outgoing *Sequence Flow* connectors.

8.3.5.1.1 Create BPEL 1.1 Model Structure

A **BPEL 1.1** model consists of a *BPEL Process* (containing a **BPEL** diagram and mappable **BPMN 1.1** constructs) and other supporting elements (like **BPMN 1.1 Assignment**, **BPMN 1.1 Web Service**) required for generating **BPEL 1.1** code. A sample **BPEL 1.1** package structure can be created in the **Project Browser**, using the **Select Model(s)** (Model Wizard) dialog. You can use this package structure as a template for developing your *BPEL Process*.

Access:

- Right-click on a package in the **Project Browser** and select the following context menu : **Add | Add a New Model using Wizard** (or)
- Select the **New Model from Pattern** icon in the **Project Browser** toolbar

Use to:

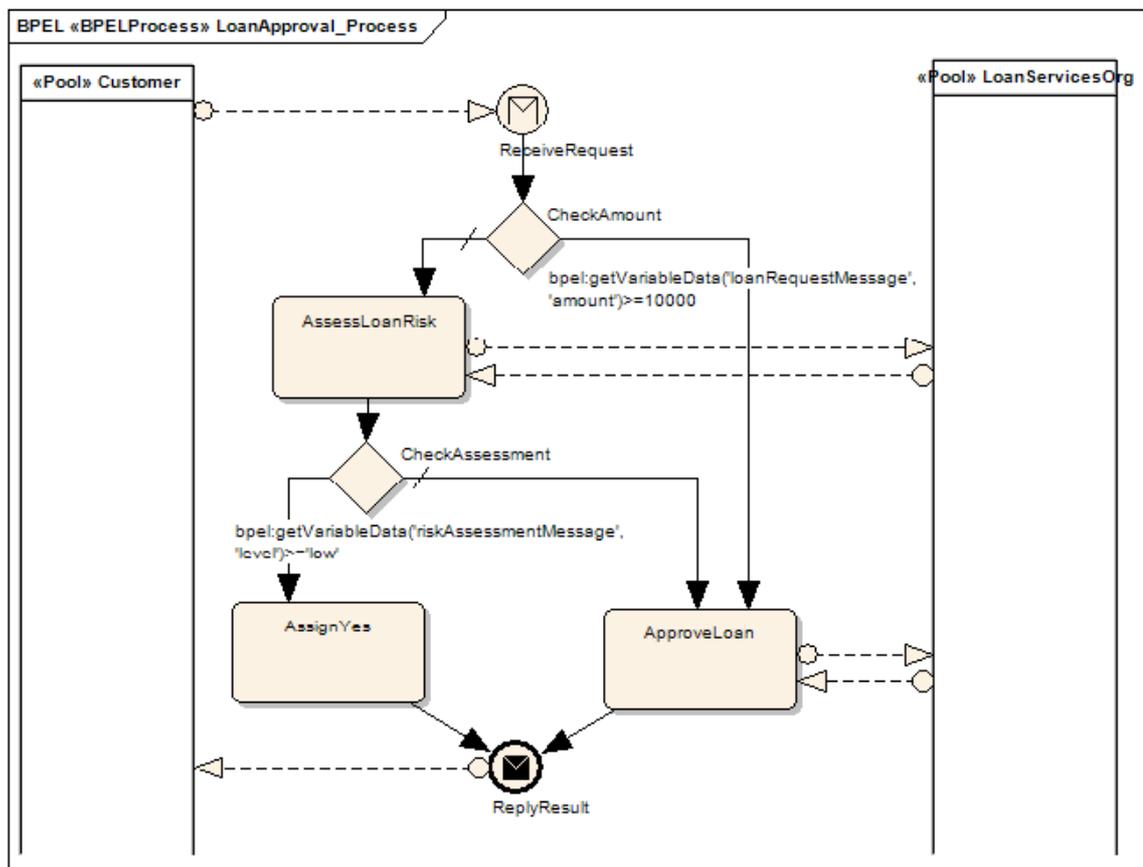

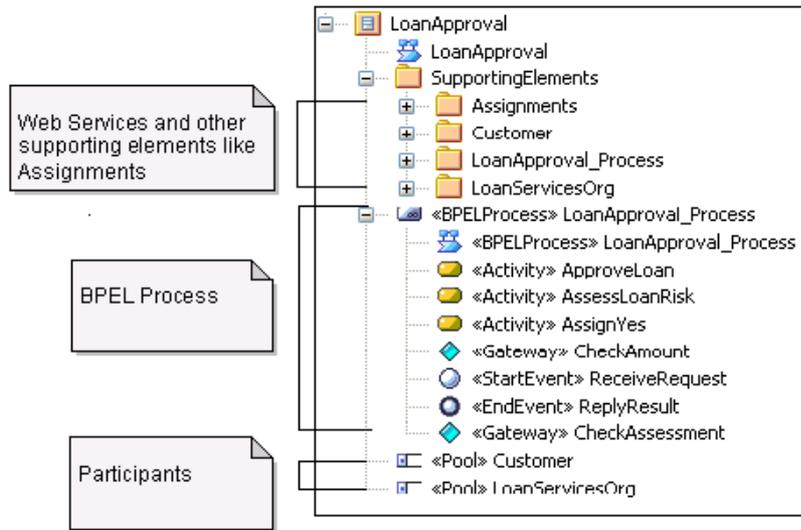

- Create a new **BPEL 1.1** package structure that can be used as a starting point for developing your *BPEL Process*.

How to:

Step	Action	See also
1	Select the root node or a package in the Project Browser	
2	Click on the New Model from Pattern icon in the Project Browser	Project Browser Toolbar 
3	Select the value BPMN 1.1 in the Technology section	Model Wizard 
4	Check the option BPEL 1.1 Model in the Name section	
5	Click on the OK button to create the sample BPEL 1.1 package structure	

Example BPEL 1.1 Package Structure:

The *BPEL Process* **LoanApproval_Process** acts as container for the **BPEL** diagram and elements. The *SupportingElements* package contains supporting components like **Assignments** and **Web Services**.

Learn More:

- [Model a BPEL 1.1 Process](#) ^[1240]
- [Create a BPEL 1.1 Web Service](#) ^[1251]
- [Generate BPEL 1.1](#) ^[1253]

8.3.5.1.2 Model a BPEL 1.1 Process

The *BPEL Process* in Enterprise Architect represents the top-level container for the BPMN 1.1 elements, from which BPEL 1.1 can be generated. Conceptually it maps to the BPEL *process* element.

BPEL Properties:

- Double-click on the *BPEL Process* in the **BPEL** diagram
- Right-click on the *BPEL Process* in the **BPEL** diagram (or the **Project Browser**) and select the following context menu : **BPEL | BPEL Properties**

Reference:

Field/Button	Usage	See Also
Name	Specify the name for the <i>BPEL Process</i>	
Query Language	Specify the value of the language used in the <i>BPEL Process</i> for the selection of nodes in <i>Assignments</i> . Defaults to XPath 1.0	
OK	Save the values entered in the dialog	
Cancel	Discard the values entered in the dialog	
Help	Display this Help topic	
General	Open the UML Properties dialog	Properties [660]

Learn More:

The *BPEL Process* element acts as a container for the following **BPMN 1.1** constructs:

- [Start Event](#) [1240]
- [Intermediate Event](#) [1242]
- [Activity](#) [1244]
- [Gateway](#) [1246]
- [End Event](#) [1247]
- [Sequence Flow](#) [1248]

The following **BPMN 1.1** constructs can be optionally used in **BPEL** modeling :

- [Pool](#) [1249]
- [Assignment](#) [1250]

8.3.5.1.2.1 Start Event

A **BPMN 1.1 Start Event** indicates where a particular *Process* begins. Every *Process* in Enterprise Architect must begin with a *Start Event*.

BPEL Properties:

- Double-click on the *Start Event* in the **BPEL** diagram (or)
- Right-click on the *Start Event* in the **BPEL** diagram (or the **Project Browser**) and select the following context menu : **BPEL | BPEL Properties**

Reference:

Notes:

- **Cancel**, **None** and **Signal Event** types cannot be mapped to **BPEL 1.1**.
- Either set **Time Cycle** or **Time Date** for **Timer Trigger Type** but not both as they are mutually exclusive fields.
- For a **Compensation Intermediate Event** edge-mounted on an *Activity*, create a **BPMN 1.1 Association** from this event to the **Compensation Activity**. Ensure that the *IsCompensation* tag for the *Activity* is set to true.
- **Link Intermediate Event** can be used either as a GOTO or an off-page connector. So, this event can have either incoming or outgoing *Sequence Flows* - but not both.

8.3.5.1.2.3 Activity

A **BPMN 1.1 Activity** represents work that is performed within a *Process*. An *Activity* can be modeled as a:

- **Sub-Process** - a compound *Activity* that is defined as a flow of other **BPMN 2.0** elements or
- **Task** - an atomic *Activity* that cannot be broken down into a smaller unit.

Activities - both *Tasks* and *Sub-Processes* - can also, optionally, act as *Looping constructs*. The **OMG BPMN 2.0 Specification** defines two types of *Looping construct*:

- **Standard Loop** (*while* or *until*)
- **Multi-Instance Loop** (*for each*)

BPEL Properties:

- Double-click on the *Activity* in the **BPEL** diagram
- Right-click on the *Activity* in the **BPEL** diagram (or the **Project Browser**) and select the following context menu : **BPEL | BPEL 2.0 Properties**

Reference:

- **Reusable Sub-Process** types cannot be mapped to **BPEL 1.1**

8.3.5.1.2.4 Gateway

A **BPMN 1.1 Gateway** control the way in which *Sequence Flows* converge and diverge within a *Process*. They provide a gating mechanism that either allows or blocks a *Sequence Flow*.

BPEL Properties:

- Double-click on the *Gateway* in the **BPEL** diagram
- Right-click on the *Gateway* in the **BPEL** diagram (or the **Project Browser**) and select the following context menu : **BPEL | BPEL Properties**

Reference:

Field/Button	Usage	See Also				
Name	Specify the name for the <i>Gateway</i>					
Gateway	Select the type for the <i>Gateway</i> , namely: <ul style="list-style-type: none"> • Complex • Exclusive • Inclusive • Parallel 					
Details	Depending on the selected Gateway , the Details tab changes as follows : <table border="1" data-bbox="512 1935 1295 2045"> <thead> <tr> <th>Field</th> <th>Usage</th> </tr> </thead> <tbody> <tr> <td></td> <td></td> </tr> </tbody> </table>	Field	Usage

Notes:

- The target of the outgoing *Sequence Flows* of this **Event Exclusive Gateway** must be either a:
 - **Receive Task**
 - **Message** or **Timer Intermediate Event**
- If a **Message Task** is one of the targets of the outgoing *Sequence Flow* of an **Event Exclusive Gateway**, then a **Message Intermediate Event** cannot be the target of the other outgoing *Sequence Flows* of this **Event Exclusive Gateway**

8.3.5.1.2.5 End Event

A **BPMN 1.1 End Event** indicates where a particular *Process* ends. Every *Process* in Enterprise Architect must end with an End Event.

BPEL Properties:

- Double-click on the *End Event* in the **BPEL** diagram
- Right-click on the *End Event* in the **BPEL** diagram (or the **Project Browser**) and select the following context menu : **BPEL | BPEL Properties**

Reference:

Field/Button	Usage	See Also
Name	Specify the name for the <i>End Event</i>	
Result Type	Select the type for the <i>End Event</i> , namely: <ul style="list-style-type: none"> • Cancel • Compensation • Error • Link • Message • Multiple • None • Signal • Terminate 	
Details	Depending on the selected Result Type , the Details tab changes as follows :	

	Field	Usage

Notes:

- **Cancel**, **Link**, **None** and **Signal Event** types cannot be mapped to **BPEL 1.1**

8.3.5.1.2.6 Sequence Flow

A **BPMN 1.1 Sequence Flow** connector shows the order in which the activities (*Tasks* and *Events*) are performed in a *BPEL Process*.

BPEL Properties:

- Double-click on the *Sequence Flow* in the **BPEL** diagram
- Right-click on the *Sequence Flow* in the **BPEL** diagram (or the **Project Browser**) and select the following context menu : **BPEL | BPEL Properties**

Reference:

Field/Button	Usage	See Also
Condition Type	Specify the type of the condition on the <i>Sequence Flow</i> , namely : <ul style="list-style-type: none"> • None • Default • Expression 	
Expression	This field gets enabled when the Condition Type is set to Expression . Specify a boolean expression to act as a gating condition.	
Ordering	This field gets enabled when the Condition Type is set to Expression . Specify a numerical value that determines the order in which the condition set in the Expression field is to be evaluated.	
Assignments	Select one or more <i>Assignment</i> elements created in the SupportingElements package in this tab (Optional)	Assignment ^[1250] Create BPEL 1.1 Model Structure ^[1238]
OK	Save the values entered in the dialog	
Cancel	Discard the values entered in the dialog	
Help	Display this Help topic	
General	Open the UML Properties dialog	Properties ^[660]

8.3.5.1.2.7 Pool

A **BPMN 1.1 Pool** represents a **Participant** in a *Process* and does not map to any specific **BPEL 1.1** element. Enterprise Architect uses *Pools* to represent external **Participants**, with which the *BPEL Process* communicates. These are 'black box' *pools* i.e., they are abstract and do not expose any details (they do not contain any **BPMN 1.1** elements inside them).

BPEL Properties:

- Double-click on the *Pool* in the **BPEL** diagram
- Right-click on the *Pool* in the **BPEL** diagram (or the **Project Browser**) and select the following context menu : **BPEL | BPEL Properties**

Reference:

Field/Button	Usage	See Also
Name	Specify the name for the <i>Pool</i>	
OK	Save the values entered in the dialog	
Cancel	Discard the values entered in the dialog	
Help	Display this Help topic	

General	Open the UML Properties dialog	Properties [660]
---------	---------------------------------------	-------------------------------------

Notes:

- A *BPEL Process* should not contain a *Pool* as its child element.
- A **BPEL** diagram under a *BPEL Process* contains an implicit *Pool* - so it is invalid to add a *Pool* in this **BPEL** diagram to represent the *BPEL Process*.
- *Pool* cannot have any incoming or outgoing *Sequence Flow* connectors - it can have only incoming or outgoing *Message Flow* connectors.

8.3.5.1.2.8 Assignment

A **BPMN 1.1 Assignment** element enables data to be copied between messages and new data to be inserted, using expressions within a *BPEL Process*. A **BPMN 1.1 Assignment** element maps to a **BPEL 1.1 assign** activity and copies the specified value from the source to the target.

In Enterprise Architect, *Assignment* elements should be created in the **Assignments** package in **SupportingElements** [1258]. If they are created elsewhere, they cannot be enacted correctly.

Access: [View](#) | [Toolbox > More tools](#) | [BPMN 1.1](#) | [BPMN 1.1 Types](#)

BPEL Properties:

- Double-click on the *Assignment* in the **BPEL** diagram
- Right-click on the *Assignment* in the **BPEL** diagram (or the **Project Browser**) and select the following context menu : **BPEL | BPEL Properties**

Reference:

Field/Button	Usage	See Also
Name	Specify the name for the <i>Assignment</i>	
Assign Time	Select either Start or End to determine whether the assignment occurs at the start or end of an <i>Activity/Event</i> .	
Copy From section		
Type	Depending on the value selected in this field, further details are required	
Literal	Specify a literal value	
Expression / Message	Select a BPMN 1.1 Message in the package representing the <i>BPEL Process / Pool</i> under the SupportingElements package	Create BPEL 1.1 Model Structure [1238] Create a BPEL 1.1 Web Service [1257]
Part	Select a BPMN 1.1 Property belonging to the selected Message (Optional)	
Copy To section		
Message	Select a BPMN 1.1 Message in the package representing the <i>BPEL Process / Pool</i> under the SupportingElements	Create BPEL 1.1 Model Structure [1238]

	package	Create a BPEL 1.1 Web Service <small>[1251]</small>
Part	Select a BPMN 1.1 Property belonging to the selected Message (Optional)	
OK	Save the values entered in the dialog	
Cancel	Discard the values entered in the dialog	
Help	Display this Help topic	
General	Open the UML Properties dialog	Properties <small>[660]</small>

Notes:

- Messages are created when you create a **Web Services**
- If you select **Expression**, Enterprise Architect uses the **getVariableData XPATH 1.0** function to create the expression from the selected **Message** and **Part**.

8.3.5.1.3 Create BPEL 1.1 Web Service

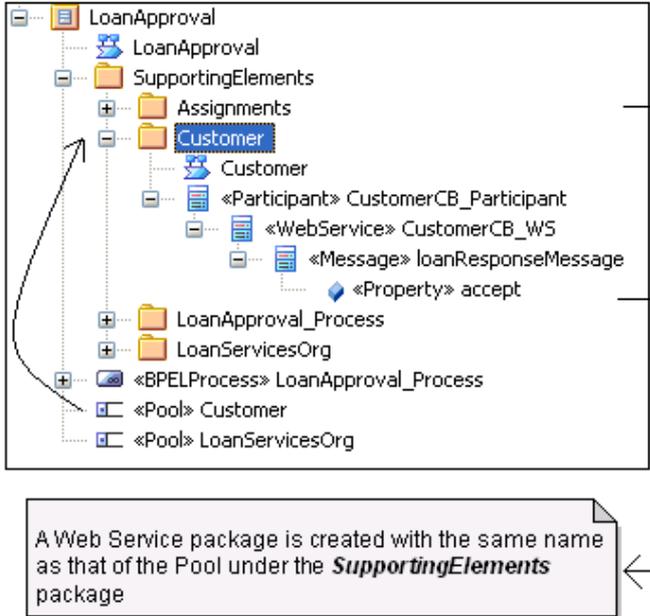

BPEL is an **Orchestration** language, which orchestrates services that are exposed using **WSDL 1.1**. It coordinates the execution of the various operations of these involved services. **BPEL 1.1** supports **WSDL 1.1 one-way** and **request-response** operations only (and not **solicit-response** and **notification** operations). Enterprise Architect enables you to create, for *BPEL Process* and *Pool* elements, **Web Service Operations** that support either *synchronous* (request-response) or *asynchronous* (one-way) interactions.

Access: Right-click on a *BPEL Process* or *Pool* and select the following context menu : **BPEL | Create WebService**

Reference:

Field/Button	Usage	See Also
Operation	Specify whether to create a new Web Service or create one from an existing WSDL created / imported into EA (using the Import WSDL dialog) by selecting either : <ul style="list-style-type: none"> • Create New (or) • Create from existing WSDL 	Model WSDL <small>[1612]</small> Import WSDL <small>[1622]</small>
Type	Specify whether to create a <i>one-way</i> or <i>request-response</i> Operation by selecting either : <ul style="list-style-type: none"> • Asynchronous (or) • Synchronous 	
Partnership Details	The interaction between the Web Service and the <i>BPEL Process</i> is modeled as a BPEL partnerLink . For this interaction, provide a:	
	Field	Usage

8.3.5.2 BPEL 2.0 Model

Enterprise Architect uses **BPMN 2.0** as a graphical front-end to capture **BPEL 2.0 Process** description (as **BPEL 2.0** does not have not a standard graphical notation). Enterprise Architect uses the partial mapping specified in the **BPMN 2.0** specification to map **BPMN 2.0** constructs to **BPEL 2.0**.

How To:

Step	Action	See Also										
1	<p>Create a BPEL 2.0 Package Structure</p> <p>Alternative:</p> <table border="1"> <thead> <tr> <th>Step</th> <th>Action</th> </tr> </thead> <tbody> <tr> <td>a</td> <td>Create a package in the Project Browser</td> </tr> <tr> <td>b</td> <td>Click on the New Diagram icon in the Project Browser</td> </tr> <tr> <td>c</td> <td>Select BPMN 2.0 in the Select From field and BPEL in the Diagram</td> </tr> <tr> <td>d</td> <td>Click on the BPEL icon from the BPMN 2.0 - Business Process to into the created BPEL diagram</td> </tr> </tbody> </table>	Step	Action	a	Create a package in the Project Browser	b	Click on the New Diagram icon in the Project Browser	c	Select BPMN 2.0 in the Select From field and BPEL in the Diagram	d	Click on the BPEL icon from the BPMN 2.0 - Business Process to into the created BPEL diagram	<p>BPEL 2.0 Package Structure^[1256]</p> <p>Project Browser Toolbar^[452]</p>
Step	Action											
a	Create a package in the Project Browser											
b	Click on the New Diagram icon in the Project Browser											
c	Select BPMN 2.0 in the Select From field and BPEL in the Diagram											
d	Click on the BPEL icon from the BPMN 2.0 - Business Process to into the created BPEL diagram											
2	Open the BPEL diagram under the <i>BPELProcess</i> stereotyped element											
3	<p>Model the <i>BPEL Process</i> using the constructs in the BPMN 2.0 - Business Process toolbox. Use the following constructs in this toolbox to model BPEL 2.0:</p> <p>BPMN 2.0 - Business Process page:</p> <ul style="list-style-type: none"> • BPEL • Activity • Data Object • Start Event • Intermediate Event 	<p>BPMN 2.0 Business Process Toolbox^[1221]</p> <p>Model BPEL 2.0 Process^[1257]</p>										

	<ul style="list-style-type: none"> • Event • Gateway • Pool <p>BPMN 2.0 - Business Process Connectors page:</p> <ul style="list-style-type: none"> • Sequence Flow • Association • Message Flow <p>BPMN 2.0 Types page:</p> <ul style="list-style-type: none"> • Assignment • Error • Interface • Operation • Participant • Property 	
4	Create Web Service Operations for the <i>BPEL Process</i> and other related <i>Pools</i> , if required	Web Service Operation <small>[1268]</small>
5	Generate BPEL 2.0 code from the <i>BPEL Process</i>	Generate BPEL 2.0 <small>[1271]</small>

Notes:

- Generating **BPEL 2.0** from a **BPMN 2.0** model is supported in the **Business and Software Engineering** and the **Ultimate** editions of Enterprise Architect.
- Ensure that **BPMN 2.0** Technology is enabled in the **MDG Technologies** dialog (**Settings | MDG Technologies**).

BPEL 2.0 Example:

- The Enterprise Architect Example file (*EAExample.EAP*) has a sample **BPMN 2.0** model from which **BPEL 2.0** can be generated.
- If you have installed Enterprise Architect at the default location, open this file: **C:\Program Files\Sparx Systems\EA\EAExample.EAP**
- The **BPMN 2.0** model package is in: **Project Models | Analysis and Business Modeling | BPEL Example | BPEL 2.0 Model**.

Modeling Restrictions:

1. Every *BPEL Process* and *Sub-Process* should start with a *Start Event* and end with an *End Event*.
 - *Boundary Start* and *End Events* are not supported
2. *Sequence Flow* Looping is not supported in both **Normal** and **Exception Paths**.
 - All *Sequence Flows* should flow downstream and not upstream.
3. *Sub-Process* cannot be a **Loop** node and have boundary *Intermediate Events*.
4. *Event Sub-Process* cannot act as a **Loop** Node.
5. *Assignments* are not supported on :
 - *Start Events* on *Event Sub-Process*
 - *End Events*
 - *Sub-Process*
 - *Boundary Intermediate Event*
 - *Gateway*
 - *Task* and *Intermediate Event* that immediately follow an *XOR Event Gateway*
6. **Exception Path** has to merge back into the **Normal Path**.
 - An exception to this rule is boundary *Compensation Intermediate Event* which should have a **BPMN 2.0 Association** to a *Compensation Activity* (that has no incoming or outgoing *Sequence Flows*)

- Multiple **Exception Paths** from an *Activity* must join at the same location in the **Normal Path**
 - An **Exception Path** should not cross another **Exception Path**.
7. *Activities* in an **Exception Path** cannot have boundary **Intermediate Events**.
8. *Pools* are treated as *black boxes* (i.e., they do not expose any details) and hence they cannot contain any child elements or have any incoming/outgoing *Sequence Flow* connectors.

8.3.5.2.1 Create BPEL 2.0 Model Structure

A **BPEL 2.0** model consists of a *BPEL Process* (containing a **BPEL** diagram and mappable **BPMN 2.0** constructs) and other supporting elements (like **BPMN 2.0 Assignment**, **BPMN 2.0 Operation**) required for generating a **BPEL 2.0** code. A sample **BPEL 2.0** package structure can be created in the **Project Browser**, using the **Select Model(s)** (Model Wizard) dialog. You can use this package structure as a template for developing your *BPEL Process*.

Access:

- Right-click on a package in the **Project Browser** and select the following context menu : **Add | Add a New Model using Wizard** (or)
- Select the **New Model from Pattern** icon in the **Project Browser** toolbar

Use to:

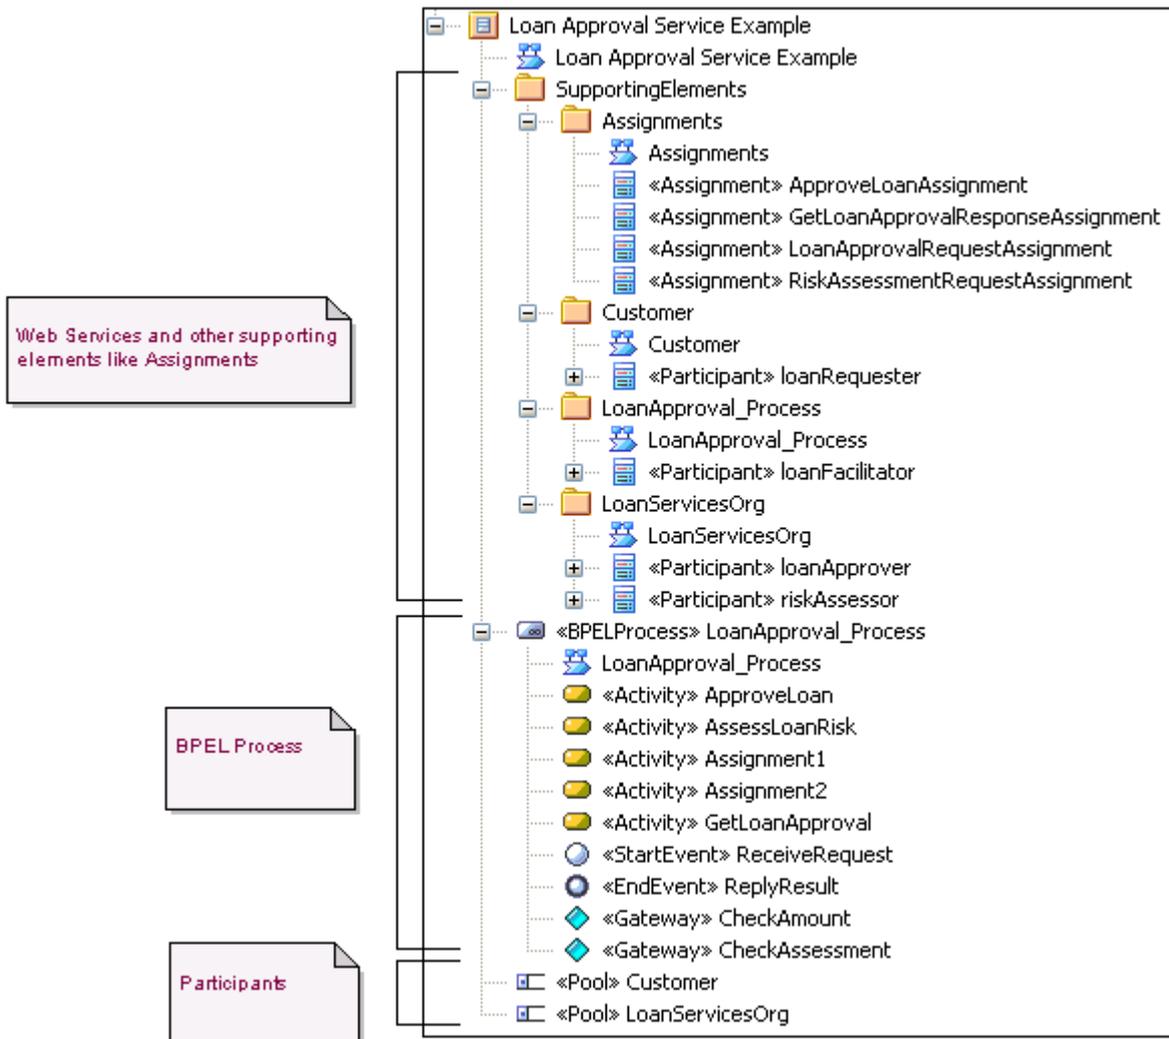

- Create a new **BPEL 2.0** package structure that can be used as a starting point for developing your *BPEL Process*.

How to:

Step	Action	See also
1	Select the root node or a package in the Project Browser	
2	Click on the New Model from Pattern icon in the Project Browser	Project Browser Toolbar [452]
3	Select the value BPMN 2.0 in the Technology section	Model Wizard [518]
4	Check the option BPEL 2.0 Model in the Name section	
5	Click on the OK button to create the sample BPEL 2.0 package structure	

Example BPEL 2.0 Package Structure:

The *BPEL Process* **LoanApproval_Process** acts as container for the **BPEL** diagram and elements. The **SupportingElements** package contains supporting components like **Assignments** and **Web Service Operations**.

**Learn More:**

- [Model a BPEL 2.0 Process](#)^[1257]
- [Create a Web Service Operation](#)^[1268]
- [Generate BPEL 2.0](#)^[1271]

8.3.5.2.2 Model a BPEL 2.0 Process

The *BPEL Process* in Enterprise Architect represents the top-level container for the **BPMN 2.0** elements, from which **BPEL 2.0** can be generated. Conceptually it maps to the BPEL *process* element.

BPEL Properties:

- Double-click on the *BPEL Process* in the **BPEL** diagram (or)
- Right-click on the *BPEL Process* in the **BPEL** diagram (or the **Project Browser**) and select the following context menu : **BPEL | BPEL 2.0 Properties**

Reference:

Field/Button	Usage	See Also
Name	Specify the name for the <i>BPEL Process</i>	
Query Language	Specify the value of the language used in the <i>BPEL Process</i> for the selection of nodes in <i>Assignments</i> . Defaults to XPath 1.0

Cancel	Discard the values entered in the dialog	
Help	Display this Help topic	
General	Open the UML Properties dialog	Properties [660]

Learn More:

The *BPEL Process* element acts as a container for the following **BPMN 2.0** constructs:

- [Start Event](#) [1258]
- [Intermediate Event](#) [1259]
- [Activity](#) [1261]
- [Gateway](#) [1263]
- [End Event](#) [1264]
- [Data Object](#) [1265]
- [Property](#) [1266]
- [Sequence Flow](#) [1266]

The following BPMN 2.0 constructs can be optionally used in BPEL modeling:

- [Pool](#) [1249]
- [Assignment](#) [1250]

8.3.5.2.2.1 Start Event

A **BPMN 2.0 Start Event** indicates where a particular *Process* begins. Every *Process* in Enterprise Architect must begin with a *Start Event*.

BPEL Properties:

- Double-click on the *Start Event* in the **BPEL** diagram (or)
- Right-click on the *Start Event* in the **BPEL** diagram (or the **Project Browser**) and select the following context menu : **BPEL | BPEL 2.0 Properties**

Reference:

Notes:

- **Cancel, Conditional, Escalation, Multiple, None, Parallel Multiple** and **Signal** event type cannot be mapped to **BPEL 2.0**
- **Assignments** tab is not available on *Intermediate Events* that are attached to the boundary of an *Activity*
- Either set **Time Cycle** or **Time Date** for **Timer Trigger Type** but not both as they are mutually exclusive fields.
- **Error** event type is valid only on an *Intermediate Event* attached to the boundary of an **Activity**
- **Compensation** event type is valid only on an *Event Sub-Process* or when attached to the boundary of an *Activity*
- **Link Intermediate Event** can be used either as a *GOTO* or an *off-page* connector. So, this event can have either incoming or outgoing *Sequence Flows* - but not both.

8.3.5.2.2.3 Activity

A **BPMN 2.0 Activity** represents work that is performed within a *Process*. An *Activity* can be modeled as a:

- **Sub-Process** - a compound *Activity* that is defined as a flow of other **BPMN 2.0** elements or
- **Task** - an atomic *Activity* that cannot be broken down into a smaller unit.

Activities - both *Tasks* and *Sub-Processes* - can also, optionally, act as *Looping constructs*. The **OMG BPMN 2.0 Specification** defines two types of *Looping* construct:

- **Standard Loop** (*while* or *until*)
- **Multi-Instance Loop** (*for each*)

BPEL Properties:

- Double-click on the *Activity* in the **BPEL** diagram
- Right-click on the *Activity* in the **BPEL** diagram (or the **Project Browser**) and select the following context menu : **BPEL | BPEL 2.0 Properties**

Reference:

8.3.5.2.2.9 Pool

A **BPMN 2.0 Pool** represents a **Participant** in a *Process* and does not map to any specific **BPEL 2.0** element. Enterprise Architect uses *Pools* to represent external **Participants**, with which the *BPEL Process* communicates. These are 'black box' *pools* i.e., they are abstract and do not expose any details (they do not contain any **BPMN 2.0** elements inside them).

BPEL Properties:

- Double-click on the *Pool* in the **BPEL** diagram
- Right-click on the *Pool* in the **BPEL** diagram (or the **Project Browser**) and select the following context menu : **BPEL | BPEL 2.0 Properties**

Reference:

Field/Button	Usage	See Also
Name	Specify the name for the <i>Pool</i>	
OK	Save the values entered in the dialog	
Cancel	Discard the values entered in the dialog	
Help	Display this Help topic	
General	Open the UML Properties dialog	Properties [660]

Notes:

- A *BPEL Process* should not contain a *Pool* as its child element.
- A **BPEL** diagram under a *BPEL Process* contains an implicit *Pool* - so it is invalid to add a *Pool* in this **BPEL** diagram to represent the *BPEL Process*.
- *Pool* cannot have any incoming or outgoing *Sequence Flow* connectors - it can have only incoming or outgoing *Message Flow* connectors.

8.3.5.2.2.10 Assignment

A **BPMN 2.0 Assignment** element enables data to be copied between messages and variables within a *BPEL Process*. An *Assignment* element maps to a **BPEL 2.0 assign** activity and copies the specified value from the source to the target.

In Enterprise Architect, *Assignment* elements should be created in the **Assignments** package in **SupportingElements** [1258]. If they are created elsewhere, they cannot be enacted correctly.

Access: [View](#) | [Toolbox > More tools](#) | [BPMN 2.0](#) | [BPMN 2.0 Business Process](#) | [BPMN 2.0 Types](#)

BPEL Properties:

- Double-click on the *Assignment* in the **BPEL** diagram
- Right-click on the *Assignment* in the **BPEL** diagram (or the **Project Browser**) and select the following context menu : **BPEL | BPEL 2.0 Properties**

Notes:

- Messages are created when you create a **Web Service Operation**

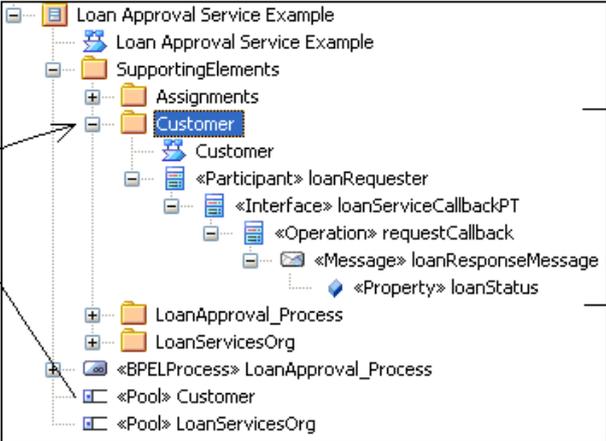

8.3.5.2.3 Create BPEL 2.0 Web Service Operation

BPEL is an **Orchestration** language, which orchestrates services that are exposed using **WSDL 1.1**. It coordinates the execution of the various operations of these involved services. **BPEL 2.0** supports **WSDL 1.1 one-way** and **request-response** operations only (and not **solicit-response** and **notification** operations). Enterprise Architect enables you to create, for *BPEL Process* and *Pool* elements, **Web Service Operations** that support either *synchronous* (request-response) or *asynchronous* (one-way) interactions.

Access: Right-click on a BPEL Process or Pool and select the following context menu: **BPEL | Create WebService**

Reference:

Field/Button	Usage	See Also																
Operation	Specify whether to create a new Web Service Operation or create one from an existing WSDL created / imported into EA (using the Import WSDL dialog) by selecting either : <ul style="list-style-type: none"> • Create New (or) • Create from existing WSDL PortType Operation 	Model WSDL ^[1612] Import WSDL ^[1622]

8.3.5.2.4 Generate BPEL 2.0

BPEL 2.0 code can be generated from a *BPEL Process*. Enterprise Architect validates the *BPEL Process* before generating the **BPEL 2.0** code. In addition to generating the **BPEL 2.0** code, **WSDL 1.1** files are generated for the *BPEL Process* and all the involved *Pools* (provided **Web Service Operations** are defined for them).

Access: Right-click on a BPEL Process and select the following context menu: **BPEL | Generate BPEL 2.0**

Reference:

Field/Button	Usage	See Also
File Name	Specify the path where the BPEL 2.0 file is to be generated	
Namespace Details	Double-click on an entry (if any) in this field to open the Namespace Details dialog and add / edit the namespace details The entry DefaultPool represents the current <i>BPEL Process</i>	
Generate BPEL	Validate the model and generate BPEL 2.0	BPEL Model Validation ^[1271]
Close	Close this dialog	
Help	Display this Help topic	
View BPEL	View the generated BPEL 2.0 file	

Learn More:

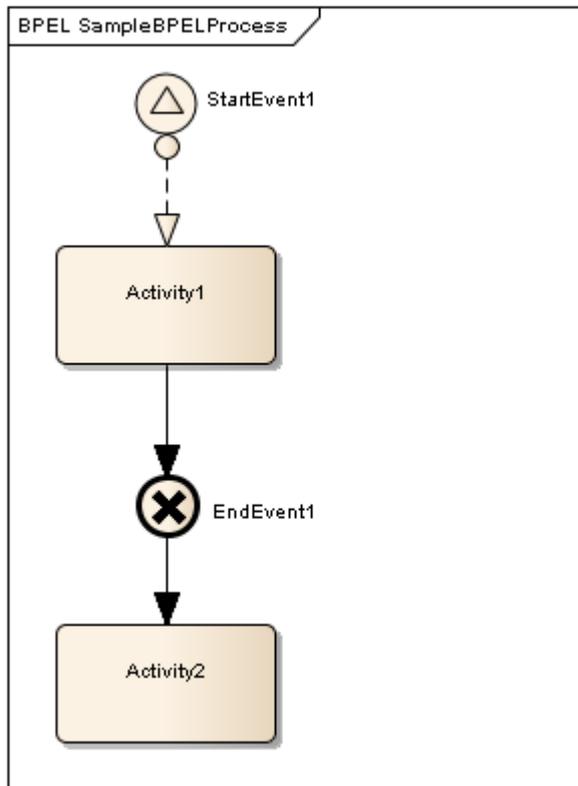

- [Model a BPEL 2.0 Process](#) ^[1257]
- [Create a Web Service Operation](#) ^[1265]

8.3.5.3 BPEL Model Validation

The **BPEL** model is validated for both *syntax* and *semantic* errors before generating the **BPEL** code. Upon successful validation, the **BPEL** file (and the associated **WSDL 1.1** files, if any) are generated. The results of the validation, as well as the progress of the **BPEL** generation, are displayed in the BPEL Progress tab of the Output window.

Example BPEL Model Violation

The following model shows several basic **BPEL** violations:

1. *StartEvent1* is of type **Signal**, which cannot be mapped to **BPEL**.
2. The *Message Flow* connector between *StartEvent1* and *Activity1* is invalid, as *Message Flow* cannot be used to connect *Activities* or *Events* within a *Process*.
3. *EndEvent1* is of type **Cancel**, which cannot be mapped to **BPEL**.
4. *EndEvent1* cannot have any outgoing *Sequence Flow* connector, as it represents the end of a *Process*.
5. *Activity2* is not valid, as only an *End Event* represents the end of a *Process*.

Notes:

- Double-click on a validation error entry in the BPEL Progress tab of the Output window to go to the source of the error in the Project Browser

8.3.6 ArchiMate

ArchiMate is an open-standard enterprise architecture language from The Open Group, based on the IEEE 1471 standard. It offers a common language for describing the construction and operation of business processes, organizational structures, information flows, IT systems and technical infrastructure, enabling Enterprise Architects to describe, analyse and visualize the relationships among business domains in an unambiguous way.

Access: From the Toolbox select: **More Tools | ArchiMate**

Topics:

Images	Topic	Detail	See also
	ArchiMate in Enterprise Architect	Enterprise Architect enables you to develop ArchiMate diagrams quickly and simply, through use of an ArchiMate MDG Technology integrated with the Enterprise Architect installer. The ArchiMate facilities are provided in the form of: <ul style="list-style-type: none"> • An ArchiMate diagram type, accessed through the New Diagram dialog • A set of ArchiMate pages in the Toolbox • ArchiMate element and relationship entries in the Toolbox Shortcut Menu and Quick Linker 	New Diagram ^[568] Toolbox Shortcut ^[55] Quick Linker ^[622]
	ArchiMate Toolbox Pages	The toolbox pages provide three categories of elements - Information, Behavior and Structure - and a page of connectors that are largely based on the UML connectors. <p>The appearance of elements can be modified with the use of Tagged Values, as suggested below:</p> <ul style="list-style-type: none"> • For <i>Artifact, Process, Function, Interaction, Service, Event, Actor, Role, Collaboration, Interface, Component, Node</i> and <i>Device</i> elements: • <i>iconstyle=true</i> shows the iconic representation of the element • <i>iconstyle=false</i> shows a rectangle with a decoration in the top corner • An Interface element (if <i>iconstyle=true</i>) can be provided, required, symmetric or assembly, and can be rotated, by setting the Tagged Values • A Function element (if <i>iconstyle=true</i>) can be rotated • An Actor element (if <i>iconstyle=false</i>) can be compound • Process and Function elements can be marked <i>atomic</i> Because there is a large range of ArchiMate elements, you should make good use of the Quick Linker arrow to guide you in selecting appropriate source and target elements and relationship types to model your enterprise architecture.	
	Disable ArchiMate	If you prefer not to use ArchiMate in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (Settings MDG Technologies).	MDG Technologies ^[1033]

8.3.7 Eriksson-Penker Extensions

Eriksson-Penker extensions (developed by H. E. Eriksson and M.Penker) provide a framework for UML business processing model extensions, to which an enterprise architect can add stereotypes and properties appropriate to their business.

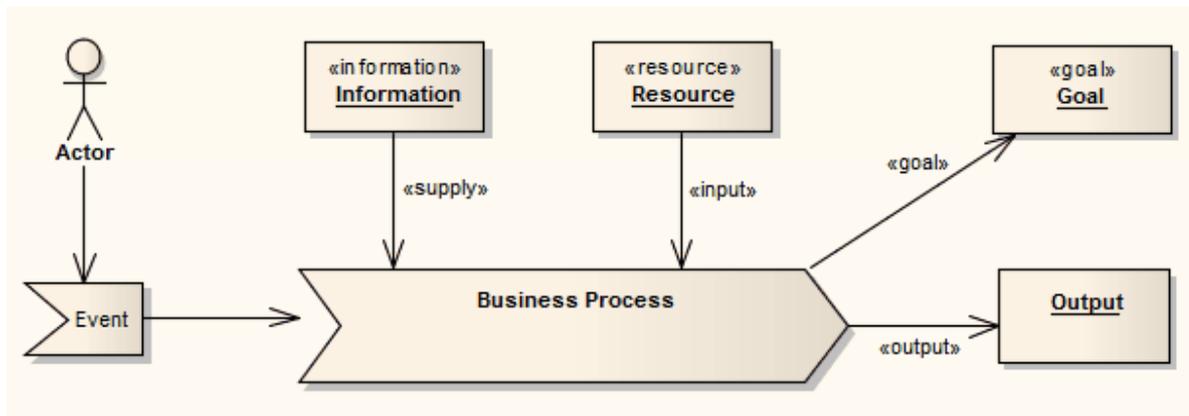

Access: From the Toolbox select: **More Tools | Eriksson-Penker Extensions**

Topics:

Images	Topic	Detail	See also
	Eriksson-Penker in Enterprise Architect	<p>Enterprise Architect provides - through the integration of MDG Technologies with the installer - two well-respected and proven UML extensions that further enhance the capture of business activities, processes, objects and information flows. One of these is Business Process Modeling Notation (BPMN). The other is the Eriksson-Penker profile which, through a set of stereotypes, provides a unique and powerful means of visualizing and communicating business processes and the necessary flow of information within an organization.</p> <p>The Eriksson-Penker extensions are provided in the form of:</p> <ul style="list-style-type: none"> • An Eriksson-Penker diagram type, accessed through the New Diagram dialog • An Eriksson-Penker page in the Toolbox • Eriksson-Penker element and relationship entries in the Toolbox Shortcut Menu and Quick Linker 	Business Process Modeling Notation ^[1219] New Diagram ^[568] Toolbox Shortcut ^[551] Quick Linker ^[622]

8.4 Data Models

Data Modelers and Information Architects are challenged with creating data models that span multiple levels of abstraction - from concept to physical implementation. They might also be responsible for maintaining traceability between these models. Enterprise Architect helps to meet these challenges with easy-to-use tools for building and maintaining all of the fundamental data models: Conceptual, Logical and Physical data models.

Topics:

Topic	Detail	See also
Conceptual Data Models	<p>Conceptual data models, also called Domain models, establish the basic concepts and semantics of a given domain and help to communicate these to a wide audience of stakeholders</p> <p>Conceptual models also serve as a common vocabulary during the analysis stages of a project; they can be created in Enterprise Architect using Entity-Relationship or UML Class models</p>	
Logical Data Models	<p>Logical data models add further detail to conceptual model elements and refine the structure of the domain; they can be defined using UML Class models</p> <p>One benefit of a Logical data model is that it provides a foundation on which to base the Physical model and subsequent database implementation</p>	
Physical Data Models	<p>Physical data models in Enterprise Architect help you visualize your database structure and automatically derive the corresponding database schema; you use Enterprise Architect's UML Profile for Data Modeling specifically for this purpose</p> <p>The profile provides useful extensions of the UML standard that map database concepts of tables and relationships onto the UML concepts of Classes and Associations; you can also model database keys, triggers, constraints, referential integrity and other relational database features</p> <p>Because Enterprise Architect lets you visualize each type of data model in the same repository, you can easily manage dependencies between each level of abstraction; this helps you maximize traceability and verify completeness of system implementation</p>

- [Physical data modeling](#)^[1346]

8.4.1 Table

Description:

A Table is a stereotyped Class. It is drawn with a small table icon in the upper right corner. You typically use this element in Data Modeling diagrams.

A Table element has a special Properties dialog, with settings for database type and the ability to set column information and data-related operations such as triggers and indexes. When setting up a Table, make sure you set the default database type for that Table, otherwise you do not have any data types to choose from when creating columns.

Toolbox Icon:

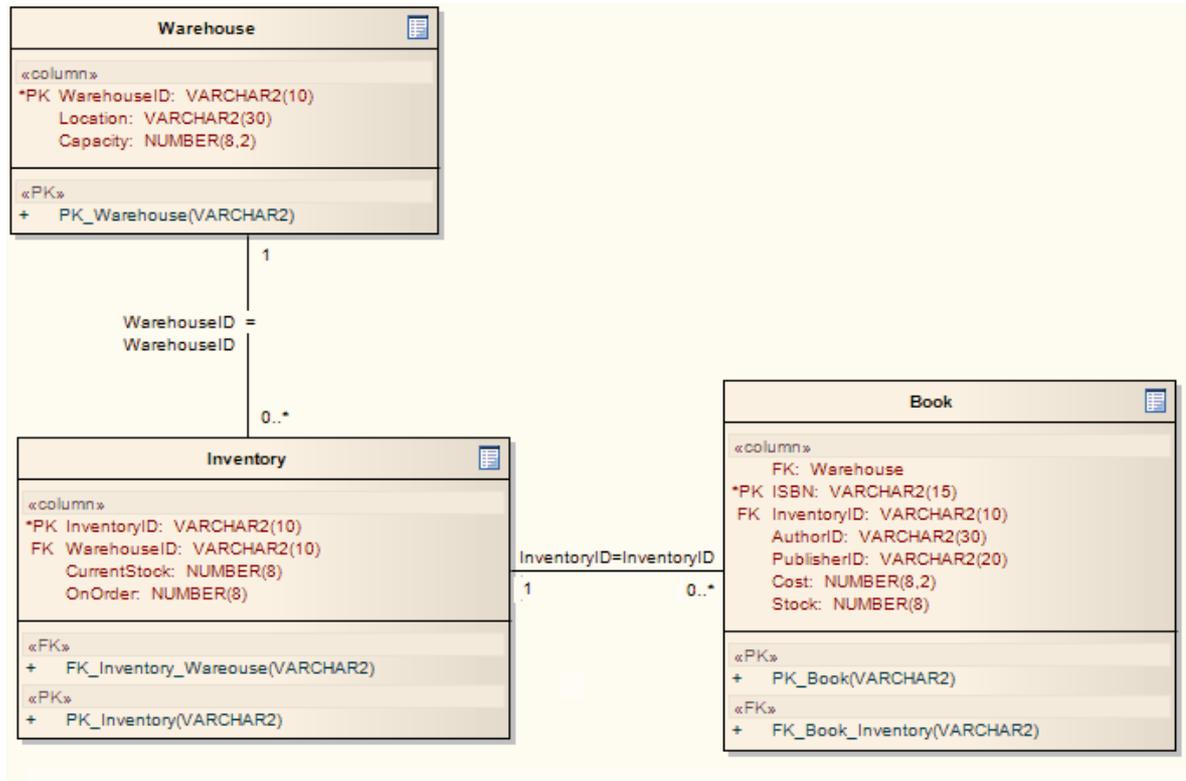

Learn More:

- [Data Modeling Diagram](#)^[1278]
- [Set the Default Database Type](#)^[1348]

8.4.2 Database Schema

The following diagram shows an example Database Schema represented by a **Physical Data Model**.

Learn More:

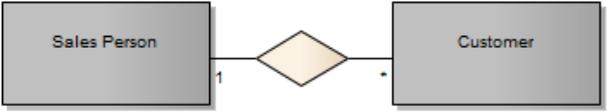

- [Physical Data Model](#)^[1346]
- [Data Modeling Toolbox](#)^[566]

8.4.3 Conceptual Data Model

A Conceptual data model is the most abstract form of data model. It is helpful for communicating ideas to a wide range of stakeholders because of its simplicity. Therefore platform-specific information, such as data types, are omitted from a Conceptual data model. Other implementation details, such as procedures and interface definitions, are also excluded. Below is an example of a Conceptual data model that is rendered using two of the notations supported by Enterprise Architect.

Using Entity-Relationship (ER) notation, we represent the data concepts "Sales Person" and "Customer" as Entities with a 1-many relationship between them.

Topics:

Topic	Detail	See also
<p>Example</p>	<div style="text-align: center;">  </div> <p>A Conceptual data model that uses Entity-Relationship notation</p> <p>We can represent the exactly the same semantic information using UML Classes and Associations</p> <p>Whether you use UML or ER notation to represent data concepts in your project depends on the experience and preferences of the stakeholders involved</p> <div style="text-align: center;">  </div> <p>An equivalent model using UML Class notation</p> <p>The detailed structure of the data concepts illustrated above is defined later by the Logical data model</p>	

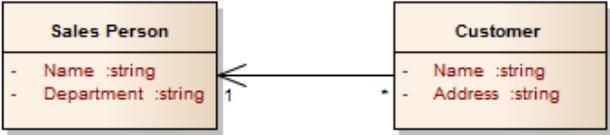

Learn more:

- [Logical data models](#)^[1279]
- [Entity Relationship modeling](#)^[1382]
- [UML Class modeling](#)^[798]

8.4.4 Logical Data Model

Logical data models help to define the detailed structure of the data elements in a system and the relationships between data elements. They refine the data elements introduced by a Conceptual data model and form the basis of the Physical data model. In Enterprise Architect, a Logical data model is typically represented using the UML Class notation.

Topics:

Topic	Detail	See also
<p>Example</p>	<p>A simple example of a Logical data model is provided below</p> <p>Note that the data elements "Sales Person" and "Customer" contain UML Attributes; the Attribute types, however, remain platform-independent</p> <div style="text-align: center;">  </div> <p>A Logical data model defined using UML Class notation</p> <p>Platform-specific Attribute types and other meta-data that relate to</p>

8.5 User Interface Models

User Interface Diagrams are customized UML diagrams used to visually mock-up a system's user interface using forms, controls and labels.

Example Diagram: [Example User Interface Diagram](#) 

Tools:

Select User Interface diagram elements and connectors from the User Interface pages of the Toolbox.

User Interface Diagram Elements	User Interface Diagram Connectors
 Package	 Associate
 Screen	 Aggregate
 UI Control	 Generalize
 Object	 Realize

Notes:

- The Enterprise Architect Professional, Corporate and Suite editions also include the MDG Win32 UI Technology, which enables you to design user interface components that render more precisely as Win32® User Interface elements

Learn More:

- [Win32 UI Technology](#) 

8.5.1 Screen

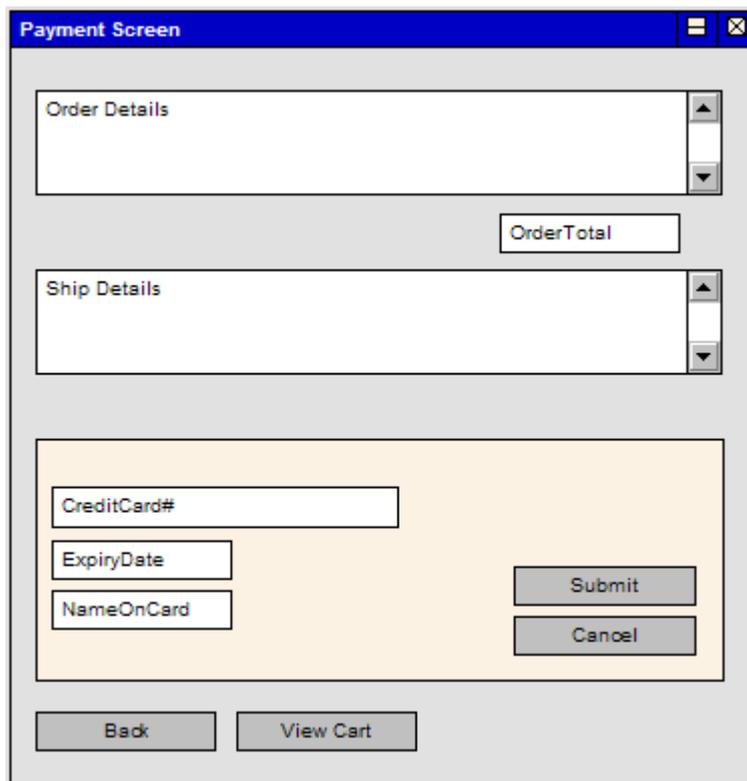

Description

A Screen is used to prototype User Interface screen flow. By using UML features such as requirements, constraints and scenarios against User Interface diagram elements, you can build up a solid and detailed understanding of user interface behavior without having to use code. This becomes an excellent means of establishing the precise behavior the system has from a user perspective, and in conjunction with the Use Case model, defines exactly how a user gets work done.

Web pages can also be prototyped and specified rigorously using Enterprise Architect's custom interface extensions.

Example

The example diagram below illustrates some features of Enterprise Architect's screen modeling extensions that support web page prototyping. By adding requirements, rules, scenarios and notes to each element, a detailed model is built up of the form or web page, without having to resort to GUI builders or HTML.

Enterprise Architect displays [UI Controls](#) ^[1282] as a range of special icons, depending on the stereotype used; for example, a Control stereotyped as a «list» displays with a vertical scroll bar.

Toolbox Icon

Learn More:

- [User Interface Diagram](#) ^[1281]
- [UI Controls](#) ^[1282]

8.5.2 UI Control Elements

Description

A UI Control element represents a user interface control element (such as an edit box). It is used for capturing the components of a screen layout and requirements in a Custom or User Interface diagram.

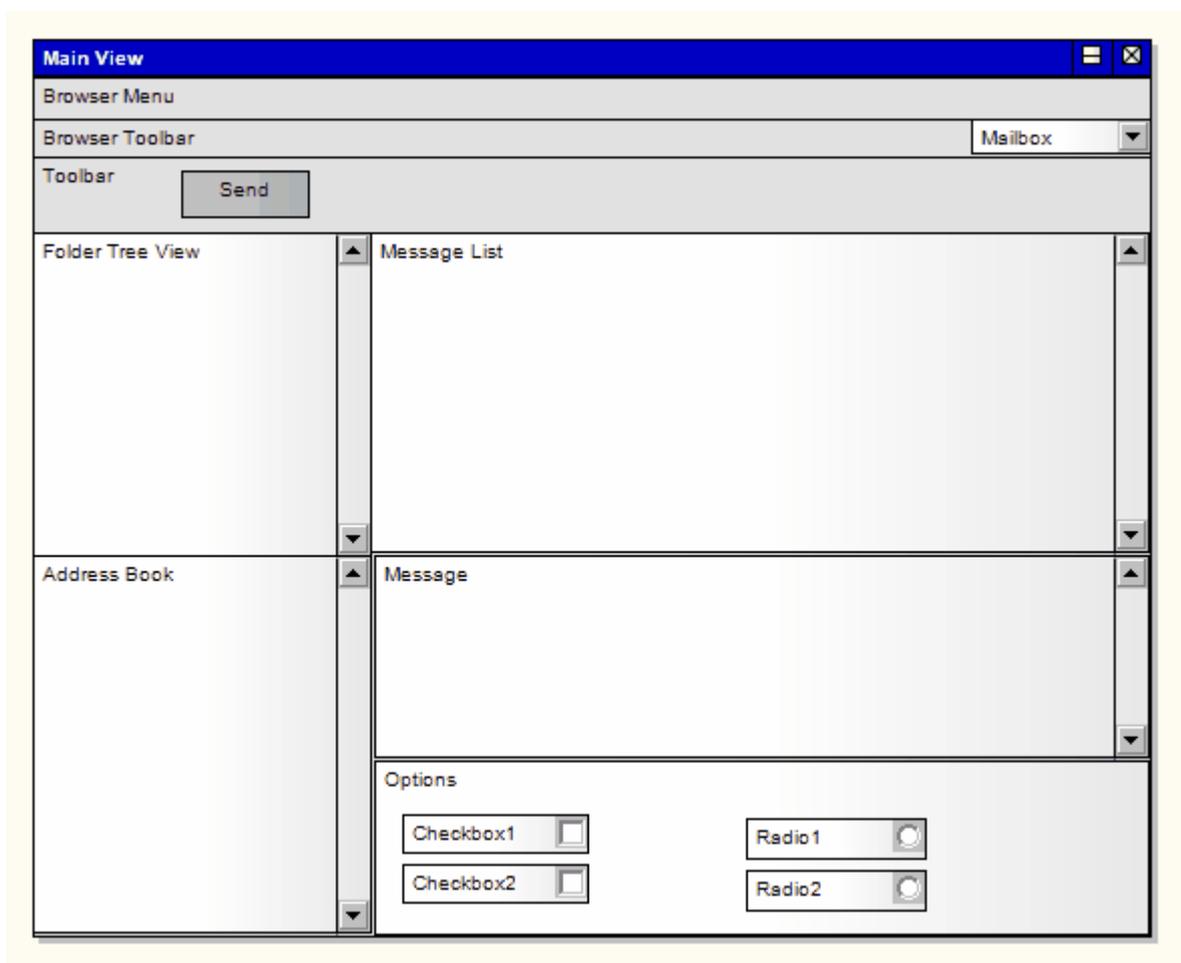

There are a number of UI Control elements available in the User Interface page of the Toolbox. These include:

- List
- Table
- Text Box
- Label
- Form
- Panel

- Button
- Combobox
- Checkbox
- Checkbox (left hand side)
- Radio button
- Radio button (left hand side)
- Vertical Line
- Horizontal Line.

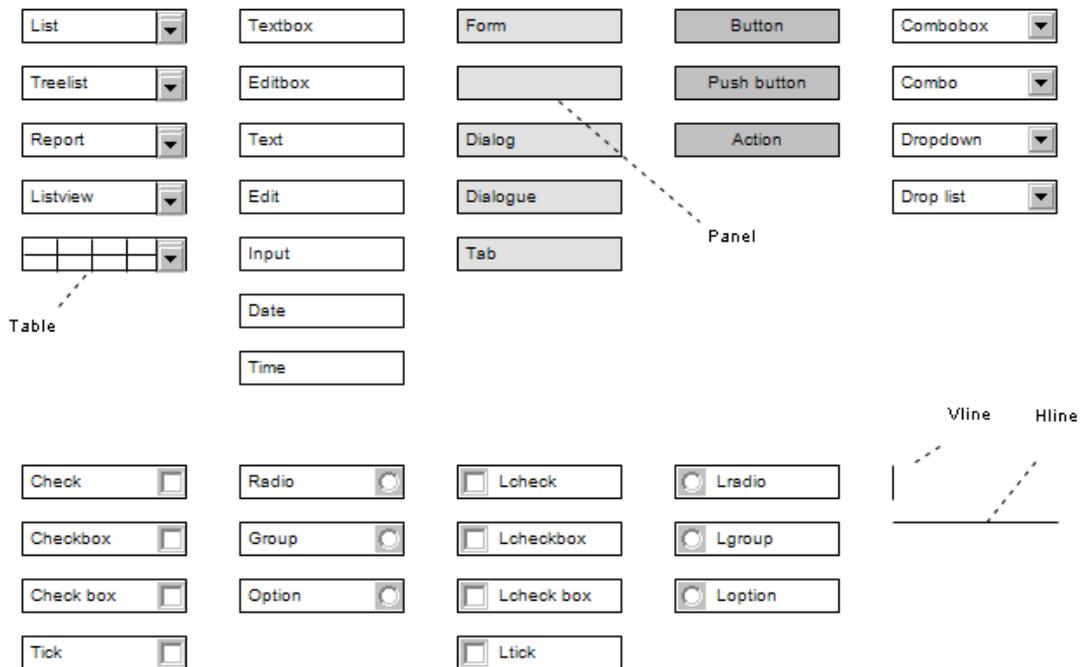

Example

The icons can be combined on a Screen icon to represent the appearance of a user interface screen, as shown:

You can also extend the available icons by selecting other stereotypes in the UI Control Element Properties dialog. The full set of available stereotypes is shown below; type or select the text in the **Stereotype** field to create the corresponding icon.

ui User Interface

Toolbox Icon

(where **UI Control** is the name of the user interface element type)

- [User Interface](#)^[1281]
- [Screen](#)^[1281]

8.5.3 Web Stereotypes

Description

Enterprise Architect supports a number of stereotypes for web page modeling, the graphical elements for which display with a **graphical icon** instead of the usual «*stereotype*» format. These stereotypes are only supported for Class elements. The image below indicates the various graphical icons and their associated stereotypes.

A similar set of web modeling elements and their relationships are also available through dedicated Web Modeling pages in the Toolbox.

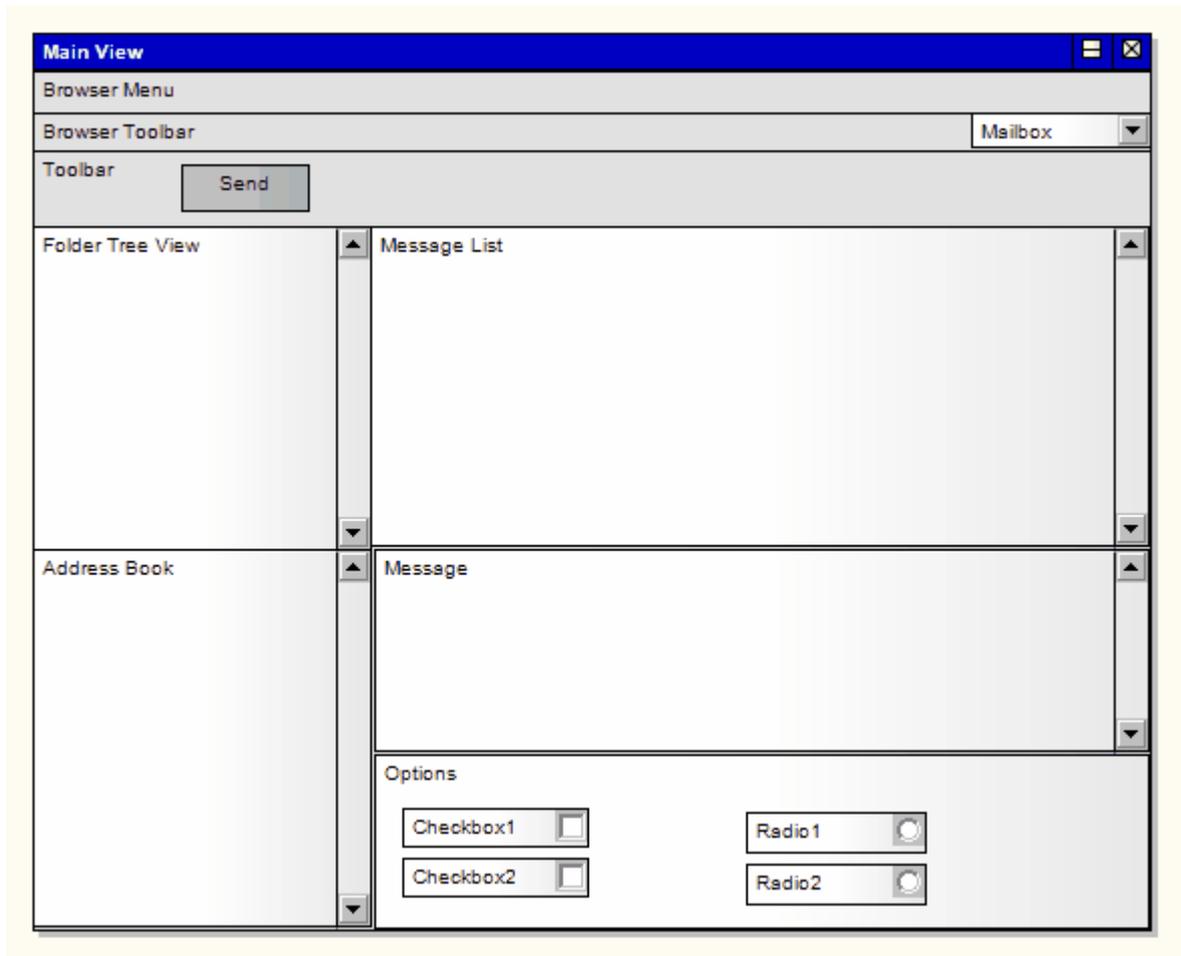

How To:

To set a web icon, follow the steps below:

Step	Action
1	Create a new Class element in a diagram
2	Display the Class Properties dialog
3	In the Stereotype field, either type in the required stereotype name or click on the drop-down arrow and select the required stereotype (as named above)
4	Click on the OK button The Class displays as in one of the examples above

8.5.4 Example User Interface Diagram

In the example User Interface diagram below, forms, controls and labels are arranged on the diagram to describe its appearance. UI Control elements can also be traced to other model elements linking the UI with the underlying implementation.

8.5.5 Win32 UI Technology

The MDG Win32 UI Technology enables you to design user interface screens that render as Win32® user interface elements.

Use To:

- Create and maintain User Interface diagrams in the Win32® User Interface formats

Access: The Win32 UI facilities are provided in the form of:

- A Win32 User Interface diagram type, accessed through the New Diagram dialog
- Win32® User Interface pages in the Toolbox
- Win32 User Interface element and relationship entries in the Toolbox **Shortcut** menu and Quick Linker

Win32 User Interface Toolbox Pages:

You can access the Win32 User Interface Toolbox pages through the **View | Toolbox: More tools... User Interface - Win32** option.

You can also set Win32® User Interface Modeling as the active default technology to access the Toolbox pages directly.

Disable Win32 User Interface Technology:

If you prefer not to use the Win32® UI Technology in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (**Settings | MDG Technologies**).

Notes:

- The MDG Win32® User Interface Technology is available in the Enterprise Architect Professional, Corporate and Suite editions

8.6 Other Stereotypes

There are many other UML elements that you can also work with in Enterprise Architect, most of which are basic elements extended by the use of stereotypes. This topic gives a brief introduction to some of these elements.

8.6.1 Boundary

Description

A Boundary is a stereotyped Object that models some system boundary, typically a user interface screen. You can also create a Boundary as a stereotyped Class. See the [Create a Boundary](#) topic. Boundary elements are used in analysis to capture user interactions, screen flows and element interactions (or 'collaborations').

A Boundary is used in the conceptual phase to capture users interacting with the system at a screen level (or some other boundary interface type). It is often used in Sequence and Robustness (Analysis) diagrams. It is the View in the Model-View-Controller pattern.

Toolbox Icon

Learn More:

- [Create a Boundary](#)^[1289]
- [Analysis Stereotypes](#)^[1186]
- [Sequence Diagram](#)^[849]
- [Communication Diagram](#)^[859]
- [Object Diagram](#)^[799]
- [Analysis Diagram](#)^[1187]

8.6.1.1 Create a Boundary

To create a Boundary element on a diagram as an Object, follow the steps below

Step	Action
1	In the Toolbox , select the More tools Analysis menu option.
2	From the Analysis Elements page, drag the Boundary element onto the diagram.

To create a Boundary element as a stereotyped Class, using the Class Properties dialog, follow the steps below

Step	Action
1	Insert a new Class.
2	Right-click on the element and select the Properties context menu option; the Properties dialog displays.
3	In the Stereotype field, type the value boundary .
4	Click on the Apply and OK buttons.
5	Save the diagram (Ctrl+S).

8.6.2 Control

Description

A Control is a stereotyped Object that models a controlling entity or manager. A Control organizes and schedules other activities and elements, typically in Analysis (including Robustness), Sequence and Communication diagrams. It is the controller of the Model-View-Controller pattern.

You can also create a Control as a stereotyped Class.

Toolbox Icon

Learn More:

- [Create a Control Element](#)^[1290]
- [Analysis Stereotypes](#)^[1186]
 - [Sequence Diagram](#)^[849]
 - [Communication Diagram](#)^[859]
 - [Object Diagram](#)^[799]
 - [Analysis Diagram](#)^[1187]

8.6.2.1 Create a Control Element

How to:

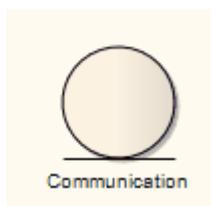

To create a Control element on a diagram as an Object, follow the steps below

Step	Action
1	In the Toolbox, select the More tools Analysis menu option
2	From the Analysis Elements page, drag the Control element onto the diagram

To create a Control element as a stereotyped Class, using the Class Properties dialog, follow the steps below

Step	Action
1	Insert a new Class
2	Right-click on the element and select the Properties context menu option The Properties dialog displays
3	In the Stereotype field, type the value control
4	Click on the Apply and OK buttons
5	Save the diagram (Ctrl+S)

8.6.3 Entity

Description

An Entity is a stereotyped Object that models a store or persistence mechanism that captures the information or knowledge in a system. It is the Model in the Model-View-Controller pattern.

You can also create an Entity as a stereotyped Class. See the Create an Entity topic.

Toolbox Icon

Learn More:

- [Create an Entity](#) ^[1297]
- [Analysis Stereotypes](#) ^[1186]
- [Sequence Diagram](#) ^[849]
- [Communication Diagram](#) ^[859]
- [Object Diagram](#) ^[799]
- [Analysis Diagram](#) ^[1187]

8.6.3.1 Create an Entity

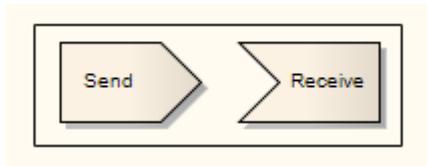

To create an Entity element on a diagram as an Object, follow the steps below

Step	Action
1	In the Toolbox , select the More tools Analysis menu option.
2	From the Analysis Elements page, drag the <i>Entity</i> element onto the diagram.

To create an Entity element as a stereotyped Class, using the Class Properties dialog, follow the steps below

Step	Action
1	Insert a new Class.
2	Right-click on the element and select the Properties context menu option; the Properties dialog displays.
3	In the Stereotype field, type the value entity .
4	Click on the Apply and OK buttons.
5	Save the diagram (Ctrl+S).

8.6.4 Event

Description:

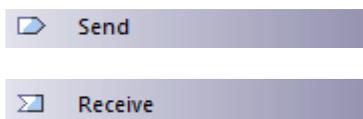

Two elements are used to model *Events*; the:

- *Send Event* which models the generation of a stimulus in the system and the passing of that stimulus to other elements, either within the system or external to the system
- *Receive Event*, depicted as a rectangle with a recessed 'V' on the left side, which indicates that an event occurs in the system due to some external or internal stimulus; typically this invokes further activities and processing

Send and Receive Events can be added from the Analysis and Activity Element pages of the Toolbox.

If you should select the wrong type of event, or otherwise want to change the type, right-click on the Event and select the **Advanced | Make Sender** or **Advanced | Make Receiver** context menu option, as appropriate.

Toolbox Icon:

8.6.5 Hyperlinks

Description

You can place a *Hyperlink* element onto a diagram. This element is a type of text element, but one that can contain a pointer to a range of objects such as associated document files, web pages, Help, model features and even other Enterprise Architect model files. When you double-click on the element, Enterprise Architect executes the link. To add a Hyperlink element, drag the *Hyperlink* icon from the **Common** page of the **Toolbox** onto the diagram.

(Alternatively, click on the **Hyperlink** icon in the **UML Elements** toolbar and then click on the diagram.)

Configure the Hyperlink:

When you add the Hyperlink to the diagram, the **Hyperlink Details** dialog displays. If you want to display the information in a more readable layout, you can resize the dialog.

You first select the type of object to link to; click on the drop-down arrow in the **Type** field and select a type. The **Hyperlink Details** dialog then displays the appropriate fields, prompts or dialog to enable you to specify the object to link to. For example, if you intend to hyperlink to:

- an attribute, the Set Attribute dialog displays to enable you to select that attribute
- a file, the **Action** field displays to enable you to specify whether to **Open** the file in read only mode, or **Edit** the file; in either case the file is opened within Enterprise Architect if possible, or, if not possible, with the Windows default viewer/editor for the file type. For example, if you hyperlink to a .rtf file, you can view it in whichever viewer is appropriate; however, you cannot *edit* .rtf files in Enterprise Architect, so the file always opens in the *Windows* default .rtf editor.
- a diagram, the **Select a Diagram** dialog displays, which enables you to select the diagram from anywhere in the project; you can filter the selection to diagrams of certain types.

In most cases you define the location of the hyperlinked object in the **Address** field, either by overtyping the field or by clicking on the (...) (Browse) button. You can use full paths or local (path substitution) paths.

If you select **EA Command** as the link type, the **Address** field is replaced by a drop-down list of Enterprise Architect commands. You can select **LocalPath** and click on the (...) (Browse) button to display the **Local Paths** dialog, which you complete as required. Subsequently, when you click on the hyperlink the **Local Paths** dialog immediately displays and you can apply, switch, expand or update the current path.

In the **Alias** field, type the text to display in the hyperlink. If you do not provide an alias, either the text defaults to the link itself, or (for certain link targets such as a matrix profile) the dialog generates a simple text instruction.

If you prefer to display only the hyperlink text, without the icon, select the **Hide Icon** checkbox.

Notes:

- If required, you can create a number of empty hyperlinks to complete later; if you then double-click on an empty hyperlink, the **Hyperlink Details** dialog displays and you can enter the details
- Once you have created the hyperlink, you can also edit the hyperlink text by clicking once on the field and once on the text, then right-clicking and selecting the **Edit Selected** context menu option
- You can add notes to the hyperlink, which display in the **Hyperlink Details** dialog when you right-click on the hyperlink and select the **Properties** context menu option; you can format these notes using the **Notes** toolbar

Learn More:

- [Hyperlinks to Files](#)^[1293]
- [Hyperlinks to Scripts](#)^[1294]
- [Add Action as a Hyperlink](#)^[1294]
- [Hyperlinks between Diagrams](#)^[1294]

8.6.5.1 Hyperlinks To Files

To create a hyperlink on a diagram to an external file, simply click on the file in a file list (such as Windows Explorer) or on your Desktop and drag it onto the diagram.

A short context menu displays with two options - **Hyperlink** and **Artifact**. Click on the **Hyperlink** option to create the hyperlink on the diagram.

The link is effective immediately, and you can right-click on it to add or change properties as necessary.

Files of most types - including .sql and .ddl - are opened within the appropriate Enterprise Architect code editor.

Learn More:

- [Hyperlinks](#)^[1292]

8.6.5.2 Script Hyperlinks

You can create a hyperlink on a diagram to execute a script. Simply drag the required script from the [Execution Analyzer](#) ^[1392] window onto the diagram. A context menu displays, from which you select whether the script to be executed is a Build, Test, Run, Debug or Deploy script. The hyperlink is effective immediately; when you click on it, the script executes.

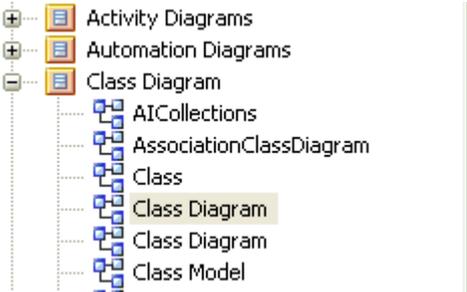

8.6.5.3 Add Action As Hyperlink

To create an Action element to represent a wide range of behaviors and actions, including a hyperlink, follow the steps below

Step	Action
1	Drag an Action element from the Activity page of the Toolbox onto the diagram A context menu immediately displays
2	Select the Other menu option The New Action dialog displays, with the Other radio button selected
3	Click on the drop down arrow on the field in the Select Kind panel, and click on the Hyperlink option
4	Click on the OK button The <i>Hyperlink Action</i> element displays on the diagram
5	Right click on the element and select the Advanced Set Hyperlink menu option The Hyperlink Details dialog displays
6	Set the hyperlink's properties ^[1292]

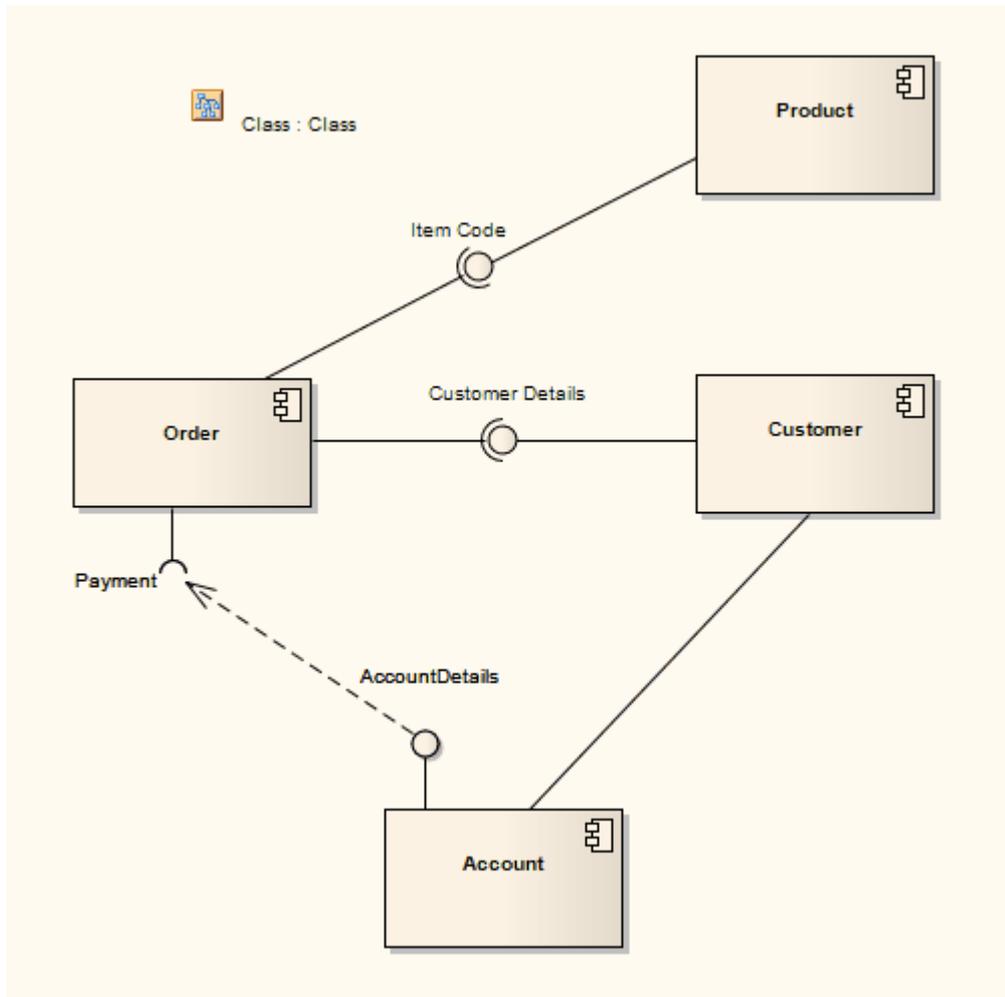

8.6.5.4 Hyperlinks Between Diagrams

To create a hyperlink between diagrams, follow the steps below

Step	Action
1	Open the diagram in which to display the hyperlink to another diagram From the Project Browser select the diagram you want to create a hyperlink to 
2	Drag the diagram on to the current diagram The Select Type dialog displays
3	Select the Hyperlink option and click on the OK button

Step	Action
	The final hyperlinked diagram should resemble the diagram below, where the Class diagram is the diagram to which the Product Order diagram hyperlinks (notice that the hyperlink icon is different)

Example

Notes:

- If the hyperlink appears as a Sub Activity, select the **Tools | Options | Diagram | Behavior** menu option and deselect the **Use Automatic SubActivities** checkbox

8.6.6 Image

Description

An Image is a System Boundary element that automatically displays first the **Boundary Properties** dialog and then the **Select Alternate Image** dialog to change its representation to an imported image. You can use it as an icon for an element or group of elements, or as a diagram background.

Image elements are available from the **Common** page of the **Toolbox**.

Toolbox Icon

Learn More:

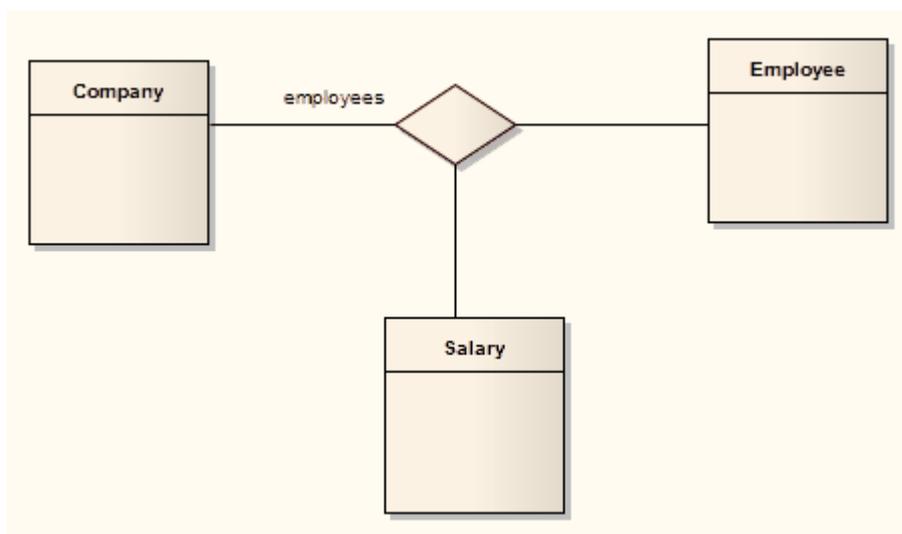

- [System Boundary](#)^[93]

8.6.7 N-Ary Association

Description

An *n*-Ary Association element is used to model complex relationships between three or more elements, typically in a Class diagram. It is not a commonly-employed device, but can be used to good effect where there is a dependant relationship between several elements. It is generally used with the Association connector, but the relationships can include other types of connector.

In the example above there is a relationship between a *Company*, an *Employee* and a *Salary*.

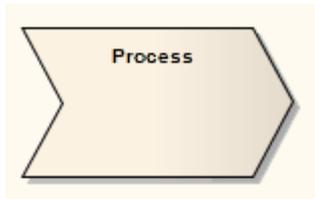

Toolbox Icon

Learn More:

- [Class Diagram](#) ^[798]
- [Association](#) ^[970]

8.6.8 Process

Description:

A Process is an Activity element with the stereotype **process**, which expresses the concept of a business process. Typically this involves inputs, outputs, work flows, goals and connections with other Processes. The Process element is typically used in Analysis diagrams.

Business processes typically range across many parts of the organization and span one or more systems.

Toolbox Icon:

Learn More:

- [Analysis diagram](#) ^[1187]

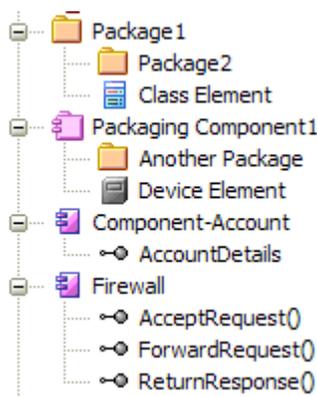

8.6.9 Packaging Component

Description

A *Packaging Component* is an element that appears very similar to a Component in a diagram but behaves as a Package in the **Project Browser** (that is, it can be version controlled and can contain other Packages and elements). It is typically used in Component diagrams.

In the **Project Browser**, the three elements display as shown below:

The Component element cannot contain child Packages or Packaging Components.

Toolbox Icon

Learn More:

- [Component diagrams](#)^[807]
- [Component](#)^[948]
- [Package](#)^[960]

8.6.10 Risk

Description

A Risk is defined as the effect of uncertainty on objectives. In Project Management, it is necessary to try to identify risks and assess:

- the likelihood that they have a negative effect on a project and
- how large that effect is likely to be.

Those risks with a high probability of occurrence and/or a large impact on the project can be mitigated.

A Risk Management process might consist of the following five steps:

1. Identify risks and represent each with a Risk element.
2. Identify which elements (e.g. Components, Use Cases, Features) are vulnerable to each risk. You might decide to create «trace» dependencies from these elements to the Risk elements.
3. Assess the likelihood and magnitude of the risks.
4. Identify ways to mitigate the risks.
5. Prioritize the risk reduction measures based on their likelihood, magnitude and ease of mitigation.

Risk *elements* are not the same as the risks that you assign *to* an element through the Project Management

window. Such risks are internal to the selected element, whilst a Risk element can be associated with a number of elements, either in a logical group or totally separate.

Risk elements are available from the Requirements page of the Toolbox.

Notes:

- Risk elements can be displayed with or without an identifying **R** in the top right corner of the element; to toggle the display of this letter, select or deselect the **Show stereotype icon for requirements** checkbox on the Options dialog, Objects page.

Toolbox Icon

8.6.11 Task

Description

A Task element represents a task that must be performed in relation to an element. The Task element enables you to assign resources to the task itself, rather than just to the parent element.

You can create a hierarchy or tree structure of Task elements to break a large task into separate parts and assign different resources to each part.

9 Model Transformation

Model Driven Architecture (MDA) Transformations provide a fully configurable way of converting model elements and model fragments from one domain to another. This typically involves converting Platform-Independent Model (PIM) elements to Platform-Specific Model (PSM) elements. A single element from the PIM can be responsible for creating multiple PSM elements across multiple domains.

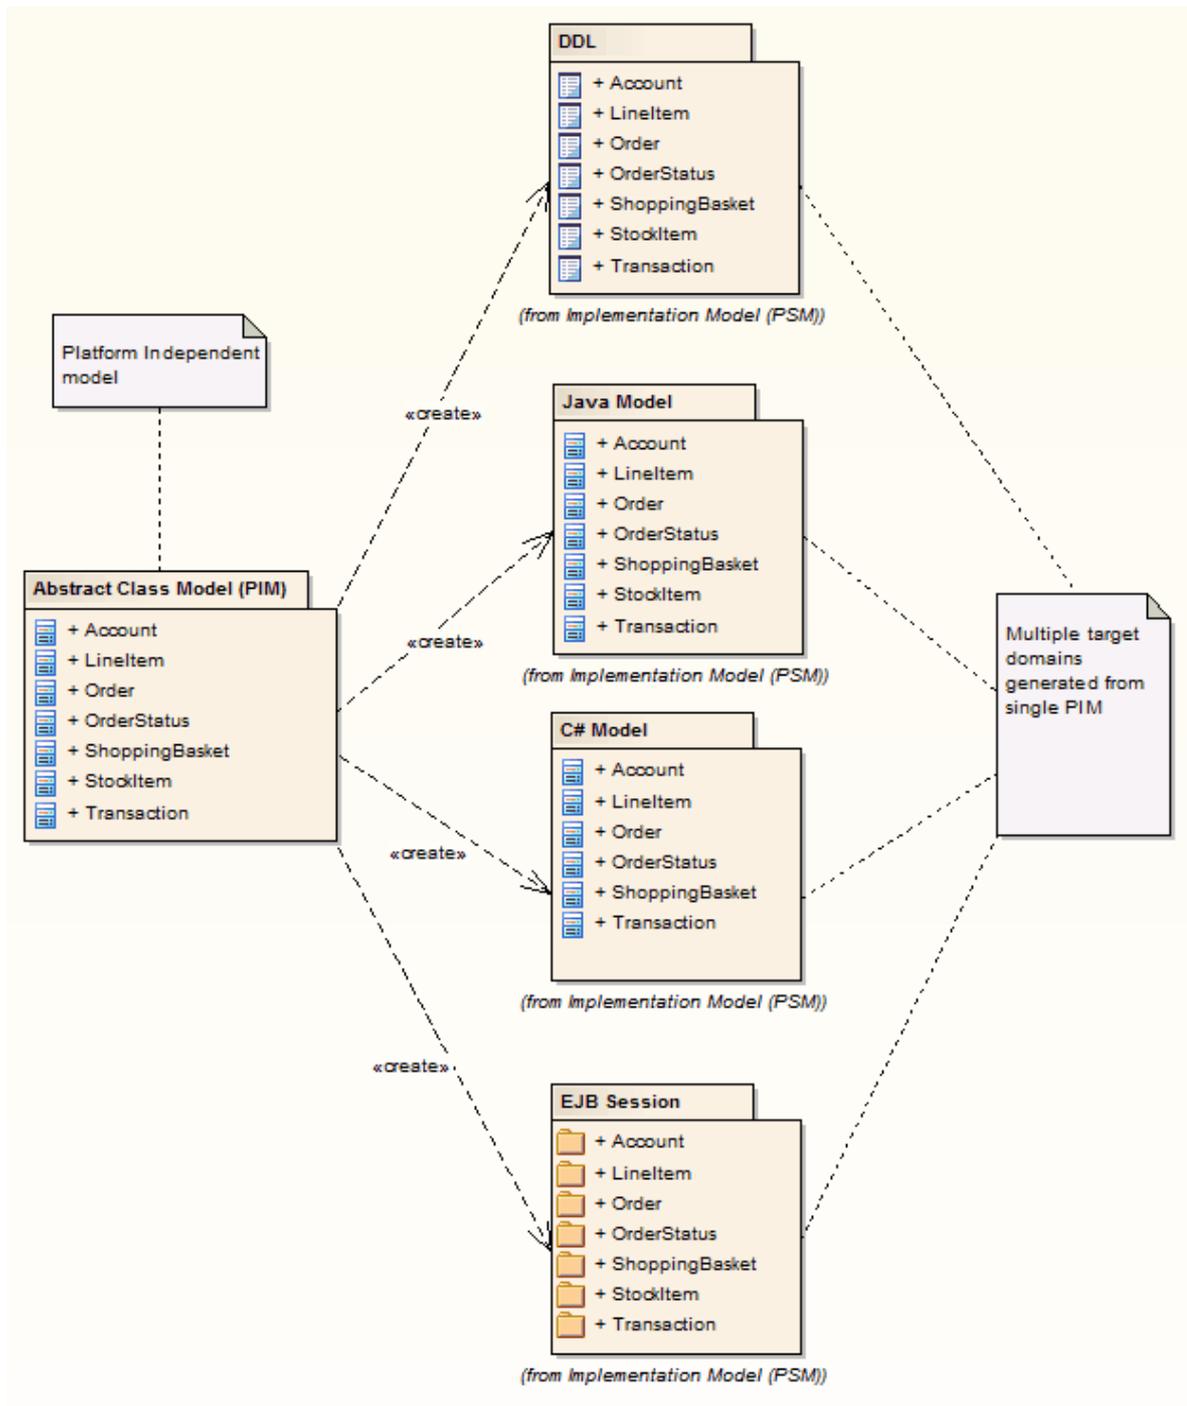

Topics:

Topic	Detail	See also
<p>Overview</p>	<p>Transformations are a huge productivity boost, and reduce the necessity of manually implementing stock Classes and elements for a particular implementation domain; for example, database tables generated from persistent PIM Classes</p> <p>Enterprise Architect includes a number of basic built-in Transformations (see <i>Included Transformations</i>, below); Sparx Systems intend to make further Transformations available over time, either as built in Transformations or as downloadable modules from the Sparx Systems website</p> <p>For a further productivity boost, Enterprise Architect can automatically generate code for your transformed Classes that target code languages; see the Generate Code on result option on the Model Transformation dialog</p> <p>A Transformation is defined using Enterprise Architect's simple code generation template language, and involves no more than writing a template to create a simple intermediary source file; Enterprise Architect reads the source file and binds that to the new PSM</p>	<p>Transform Elements^[1305]</p>
<p>Transformation Dependencies</p>	<p>Enterprise Architect also creates internal bindings (Transformation Dependencies) between each PSM created and the original PIM</p> <p>This is essential, as it enables you to forward synchronize from the PIM to the PSM many times, adding or deleting features as you go; for example, adding a new attribute to a PIM Class can be forward synchronized to a new column in the Data Model</p> <p>You can observe the Transformation Dependencies for a package using the Traceability window; this enables you to check the impact of changes to a PIM element on the corresponding elements in each generated PSM, or to verify where a change required in a PSM should be initiated in the PIM (and also to reflect back in other PSMs)</p>	<p>Traceability^[493]</p>

Topic	Detail	See also
	<p>The Transformation Dependencies are a valuable tool in managing the traceability of your models</p> <p>Enterprise Architect does not delete or overwrite any element features that were not originally generated by the transform; therefore, you can add new methods to your elements, and Enterprise Architect does not act on them during the forward generation process</p>	
<p>Included Transformations</p>	<p>Transformations that are currently built-in include:</p> <ul style="list-style-type: none"> • C# - Converts a PIM to a standard C# implementation set • Data Model to ERD - Transforms a Data Model to an Entity Relationship Diagram (ERD) • DDL - Transforms platform-independent Class elements to platform-specific table elements • EJB Entity - Transforms platform-independent Class elements to packages containing the Class and Interface elements that comprise an EJB Entity Bean • EJB Session - Transforms platform-independent Class elements to packages containing the Class and Interface elements that comprise an EJB Session Bean • ERD to Data Model - Transforms an Entity Relationship Diagram into a Data Model • Java - Transforms platform-independent elements to Java language elements • JUnit - Converts a Java model to a model where test methods are created for each public method of any original Class • NUnit - Converts a .Net language specific model to a model where test methods are created for each public method of any original Class • WSDL - Converts a simple representation of a WSDL interface into the elements required to generate that interface • XSD - Transforms platform-independent elements to XSD elements 	

Example:

The following diagram highlights how Transformations work and how they can significantly boost your productivity:

**Notes:**

- If you are using the Corporate, Business and Software Engineering, System Engineering or Ultimate edition, if security is enabled you must have **Transform Package** access permission to perform an MDA Transform on a package

Learn More:

- [Permission List](#)^[205]

- [Transform Elements](#) [1305]
- [Import Transformations](#) [1331]
- [Transformation Templates](#) [1330]
- [Built-in Transformations](#) [1307]
- [Write Transformations](#) [1332]
- [Chaining Transformations](#) [1306]

9.1 Transform Elements

There are two modes for initiating a Model Transformation, each of which can be started in two ways.

Access:

To transform selected elements on a diagram: **Tools | Model Transformation (MDA) | Transform Selected Elements**

Class context menu | Transform (Ctrl + H)

To transform elements in the package currently selected in the Project Browser:

Package **Tools | Model Transformation (MDA) | Transform Current**

Current Package **Project Browser package context menu | Transform**

Use To:

- Transform elements
- Transform packages

Reference:

Field	Usage	See also
Elements	Indicates the individual elements to be included in the transformation	
All	Indicates all of the elements from the list to be included in the transformation	
None	Deselects all of the elements from the list	
Include child packages	Specifies inclusion of elements in child packages of the selected package	
Transformations	Indicates which transformations to perform and the package each of them should be transformed to (use the (...) button to select the package in which the transformed elements are being created)	
Generate Code on result	Specify whether or not to automatically generate code for transformed Classes that target code languages Automatically generating code helps boost productivity in development With this option selected, the first time you transform to the selected Class Enterprise Architect enables you to select a filename to generate to; subsequent transformations automatically generate any Class with a filename set	
Perform Transformations on result	Specify if transformations previously done on target Classes should be automatically executed	Chaining Transformations <small>[1306]</small>
Intermediary File	Specify the filename of the intermediary file (if any)	

Field	Usage	See also
Write Always	Write the intermediary file to disk	
Write Now	Generate the intermediary file but do not perform the transform	
Do Transform	Execute the transform command	

Notes:

- When the dialog displays, all elements are selected and all transformations previously performed from any of these Classes are checked

9.1.1 Chaining Transformations

Chaining transformations provide an extra degree of flexibility and power to transformations.

Topics:

Topic	Detail	See also
Example	Two transformations have a common element; you might separate this element out into its own transformation, and then perform the original transformations from the common point The separated transform could even produce a useful model itself	
Setting	Enterprise Architect provides for chaining transformations, by enabling you to set transformations that have already been performed on target Classes to be performed automatically next time that Class is transformed to To do this, select the Perform Transformations on result checkbox in the Model Transformation dialog	

9.2 Built-in Transformations

Enterprise Architect provides a number of built-in transformations. These transformations are intended to be useful to as many users as possible, acting as a good base to modify to include the specifics of your custom domain, and to be good examples of how to write transformations.

The following transformations are included in Enterprise Architect:

Transformations	Detail	See also
C#	Converts Platform-Independent Model (PIM) elements to language-specific C# Class elements	C# Transformation <small>[1307]</small>
Data Definition Language	Creates a data model from the logical model, generating a model targeted at the default database type that is ready for DDL generation	DDL Transformation <small>[1310]</small>
Entity Relationship Diagram to Data Model	Creates a data model from the ERD logical model, generating a model targeted at the default database type ready for DDL generation	ERD To Data Model Transformation <small>[1317]</small>
Data Model to Entity Relationship Diagram	A reverse of the ERD to Data Model transformation	Data Model To ERD Transformation <small>[1310]</small>
EJB Session Bean	Generates a single Class elements to EJB session	EJB Transformations <small>[1314]</small>
EJB Entity Bean	Generates a single Class elements to EJB entity	EJB Transformations <small>[1314]</small>
Java	Converts Platform-Independent Model (PIM) elements to language-specific Java Class elements	Java Transformation <small>[1319]</small>
JUnit	Creates a Class with test methods for all public methods of an existing Java Class	JUnit Transformation <small>[1321]</small>
NUnit	Creates a Class with test methods for all public methods of an existing .Net compatible Class	NUnit Transformation <small>[1323]</small>
WSDL	Creates an expanded model of a WSDL interface from a simple model, which is suitable for generation	WSDL Transformation <small>[1325]</small>
XSD	Converts Platform-Independent Model (PIM) elements to UML Profile for XML elements as an intermediary step to creating an XML Schema	XSD Transformation <small>[1326]</small>

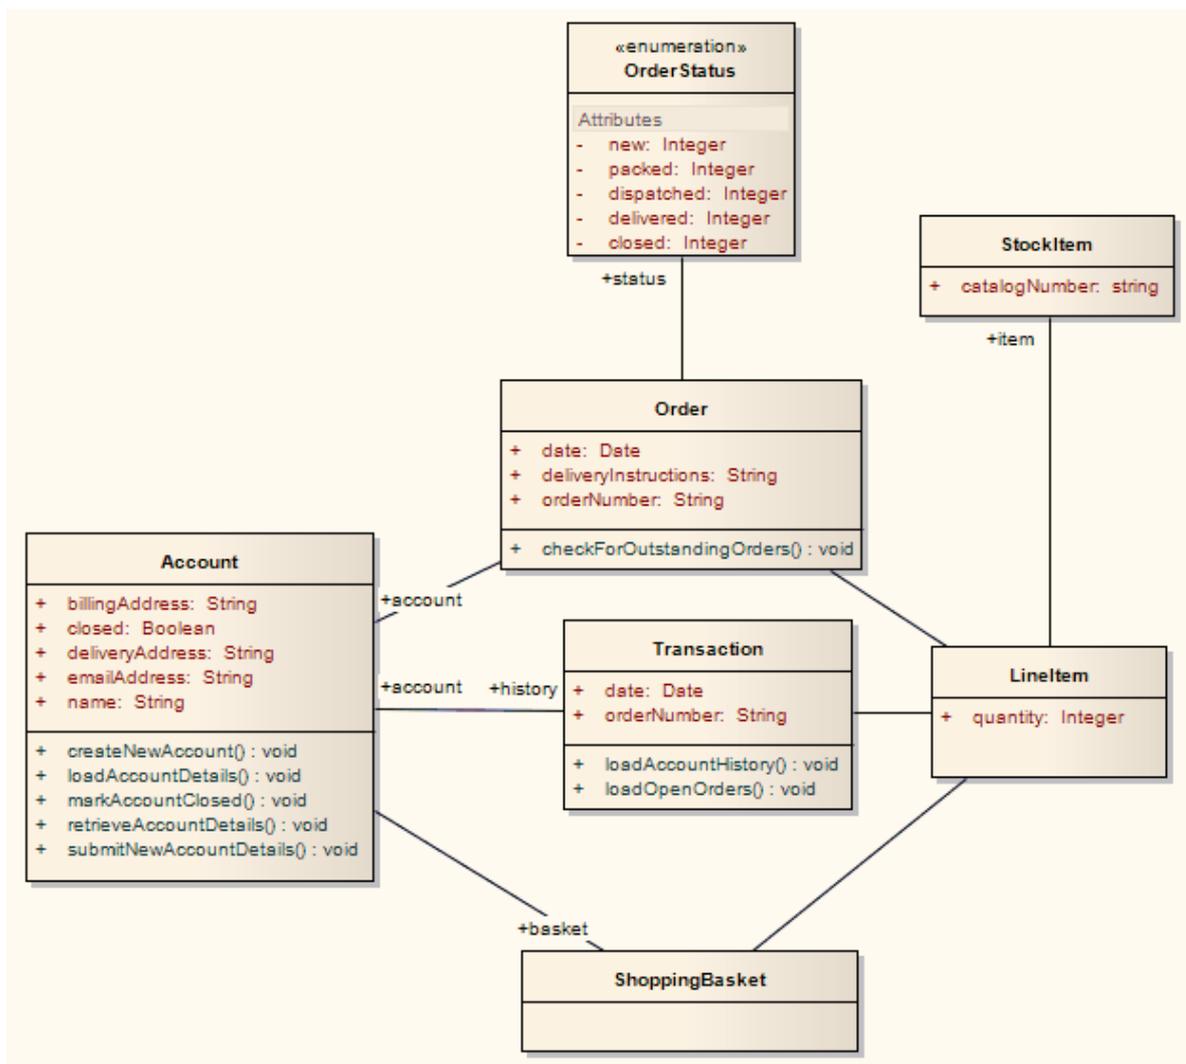

9.2.1 C# Transformation

The **C# transformation** converts Platform-Independent Model (PIM) elements to language-specific C# Class elements.

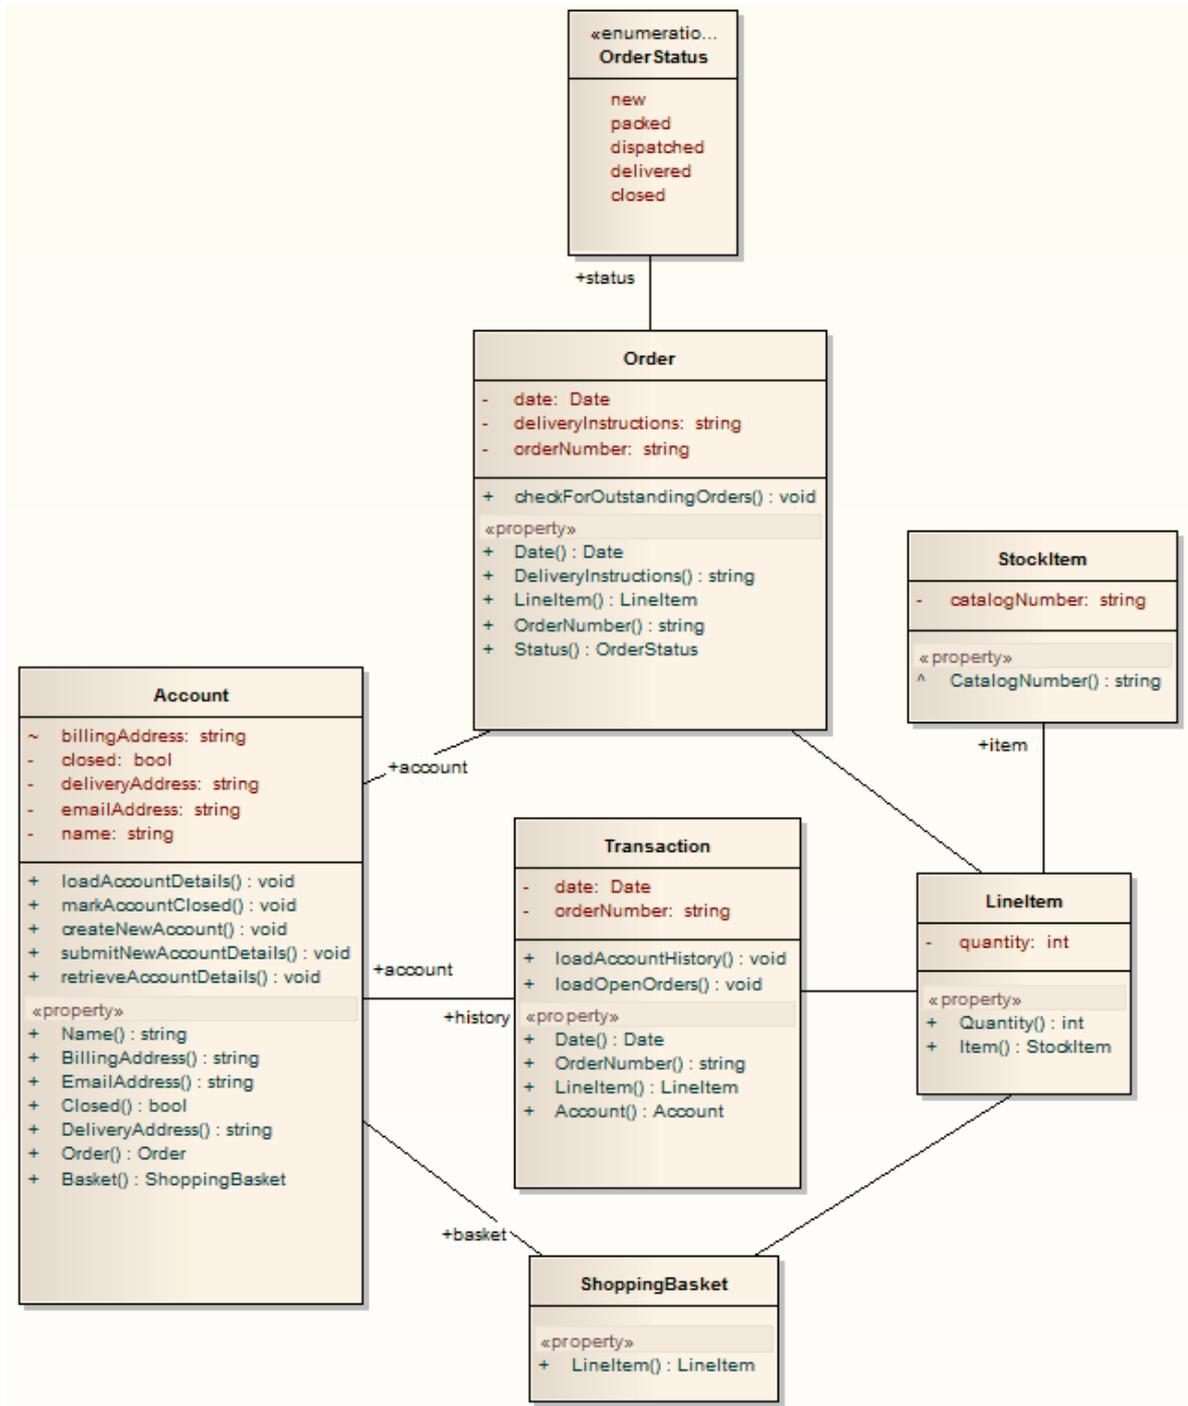

The transformation converts PIM model types to C# types and creates encapsulation according to Enterprise Architect's options for creating properties from C# attributes, which you set on the C# Specifications page of the Options dialog.

Example:

The Platform-Independent Model (PIM):

After transformation, becomes the PSM:

Learn More:

- [C# Options Page](#)¹⁵³²

9.2.2 Data Model To ERD Transformation

The **Data Model to ERD transformation** is a reverse engineering of the **ERD to Data Model transformation**.

The transformation uses and demonstrates support in the intermediary language for the following database-specific concepts:

Reference:

Concept	Definition	See also
Entity	Mapped one-to-one onto table elements.	
Attribute	Mapped one-to-one onto columns.	
Primary Key	Comes from the PrimaryKey type of column.	

Notes:

- Sometimes you might want to limit the stretch of the diamond-shape Relationship connectors. Simply pick a Relationship connector, right-click to display the context menu, and select the **Bend Line at Cursor** option

Learn More:

- [ERD to Data Model Transformation](#)^[1317]

9.2.3 DDL Transformation

The purpose of the **DDL transformation** is to create a data model from the logical model, generating a model targeted at the default database type that is ready for DDL generation. The data model can then be used to automatically generate DDL statements to run in one of the Enterprise Architect supported database products.

The **DDL Transformation** uses and demonstrates support in the **intermediary language** for the following database-specific concepts:

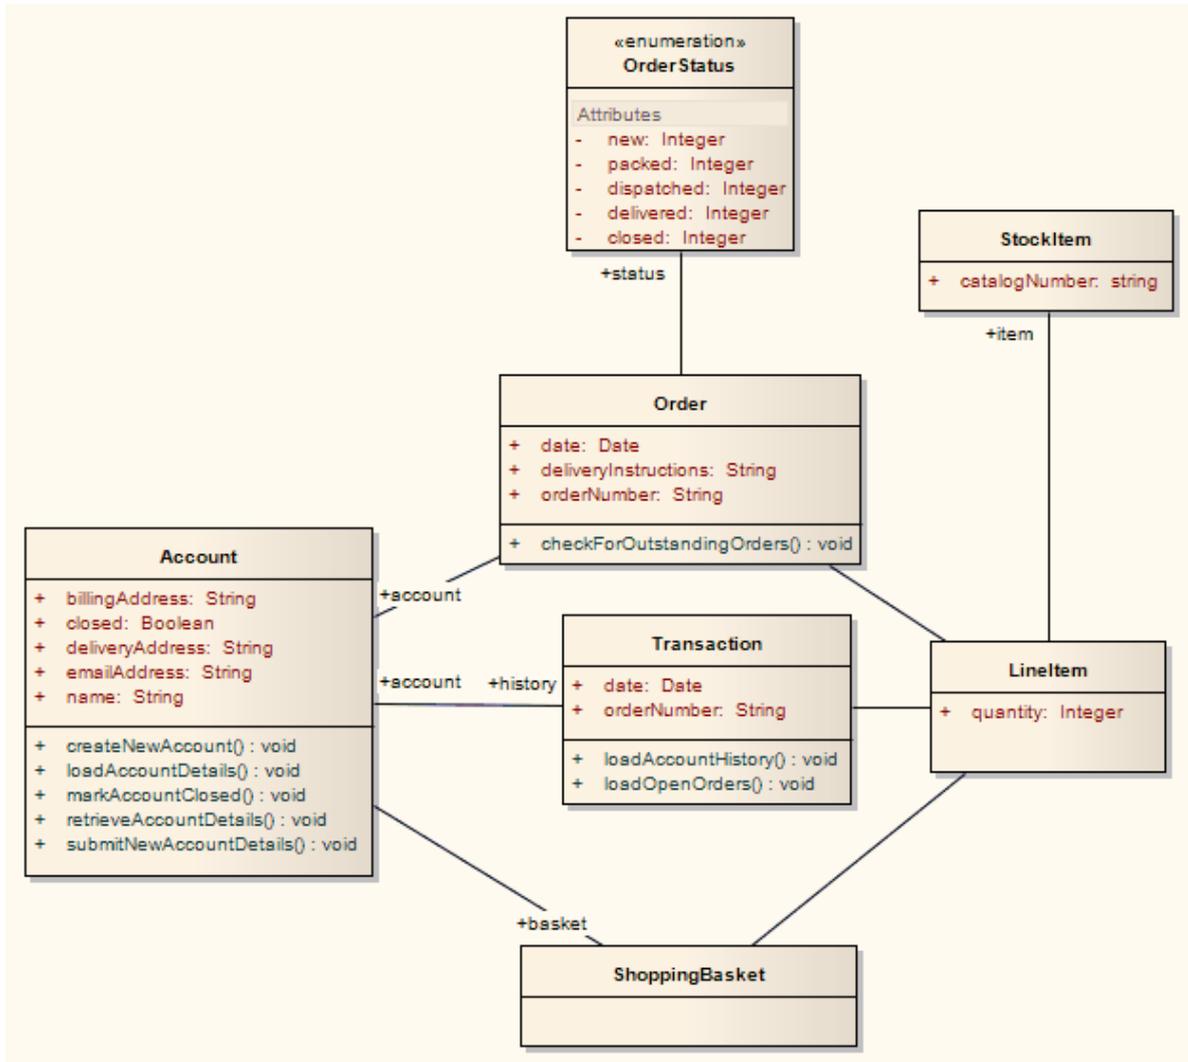

Reference:

Concept	Definition	See also
Table	Mapped one-to-one onto Class elements.	
Column	Mapped one-to-one onto attributes.	
Primary Key	Lists all the columns involved; this ensures that they exist in the Class and creates a primary key method for them.	
Foreign Key	This is a special sort of connector. The <i>Source</i> and <i>Target</i> sections list all of the columns involved; this ensures that they exist and that a matching primary key exists in the destination Class, and that the transformation creates the appropriate foreign key.	

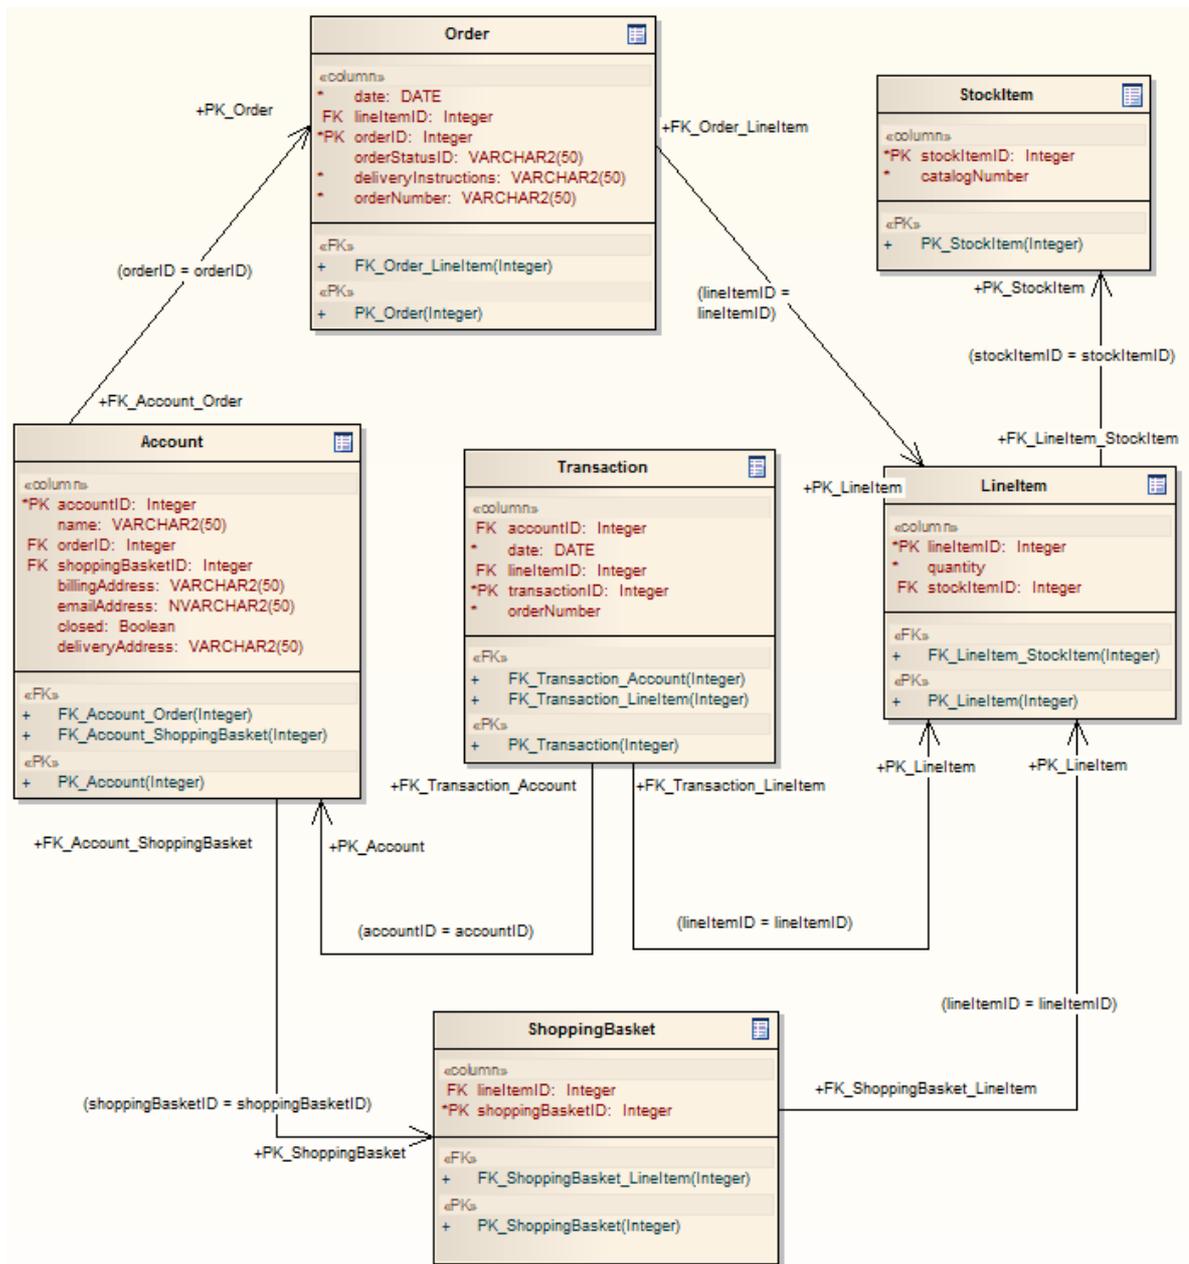

Example:

The following two diagrams show a typical PIM to Data Model Transformation.

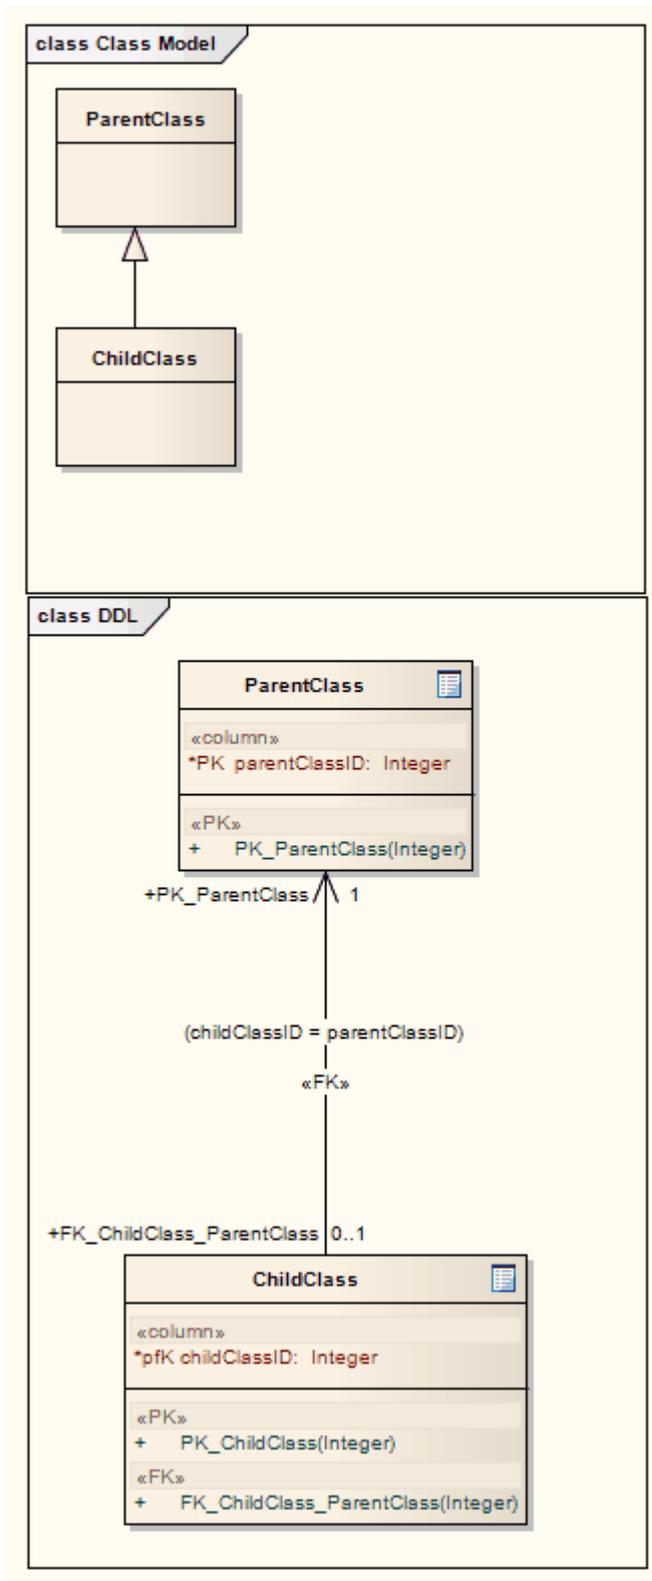

The Platform-Independent Model (PIM):

After transformation becomes the PSM:

Generalizations are handled by providing the child element with a foreign key to the parent element, as in the following diagram. Copy-down inheritance is not supported.

Learn More:

- [Intermediary Language](#) I1333

9.2.4 EJB Transformations

The purpose of the **EJB Session Bean transformation** and the **EJB Entity Bean transformation** is to reduce the work required in generating the internals of Enterprise Java Beans, thus enabling you to concentrate on modeling at a higher level of abstraction.

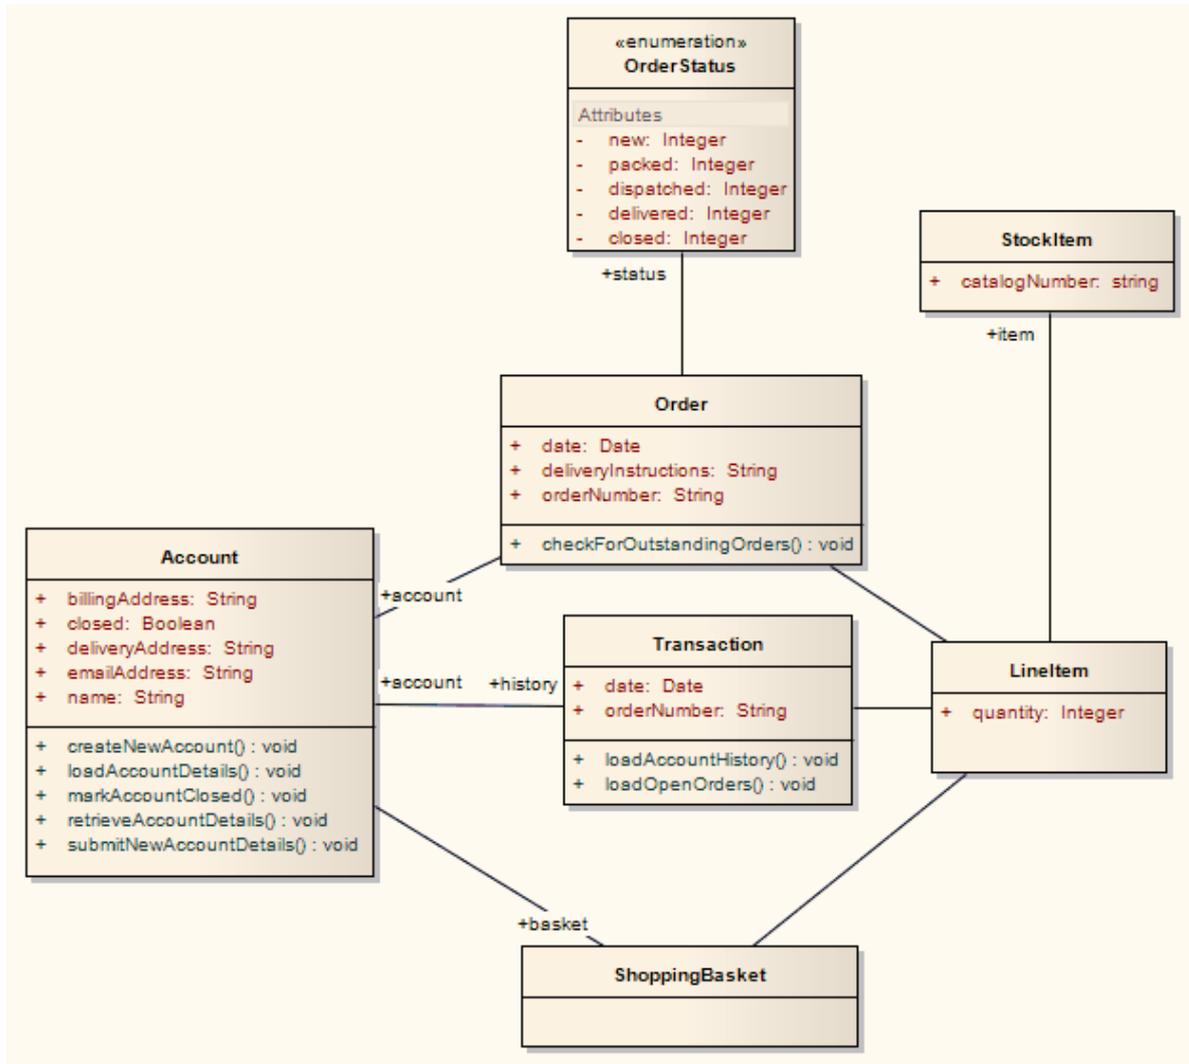

Topics:

Topic	Detail	See also
EJB Session Bean transformation	The EJB Session Bean transformation generates the following from a single Class element containing the attributes, operations and references required for code generation by the <code>javax.ejb.*</code> package: <ul style="list-style-type: none">• An implementation Class element• A home interface element• A remote interface element	
EJB Entity Bean transformation	The EJB Entity Bean transformation generates the following from a single Class element containing the attributes, operations and references required for code generation by the <code>javax.ejb.*</code> package: <ul style="list-style-type: none">• An implementation Class element• A home interface element• A remote interface element• A primary key element	

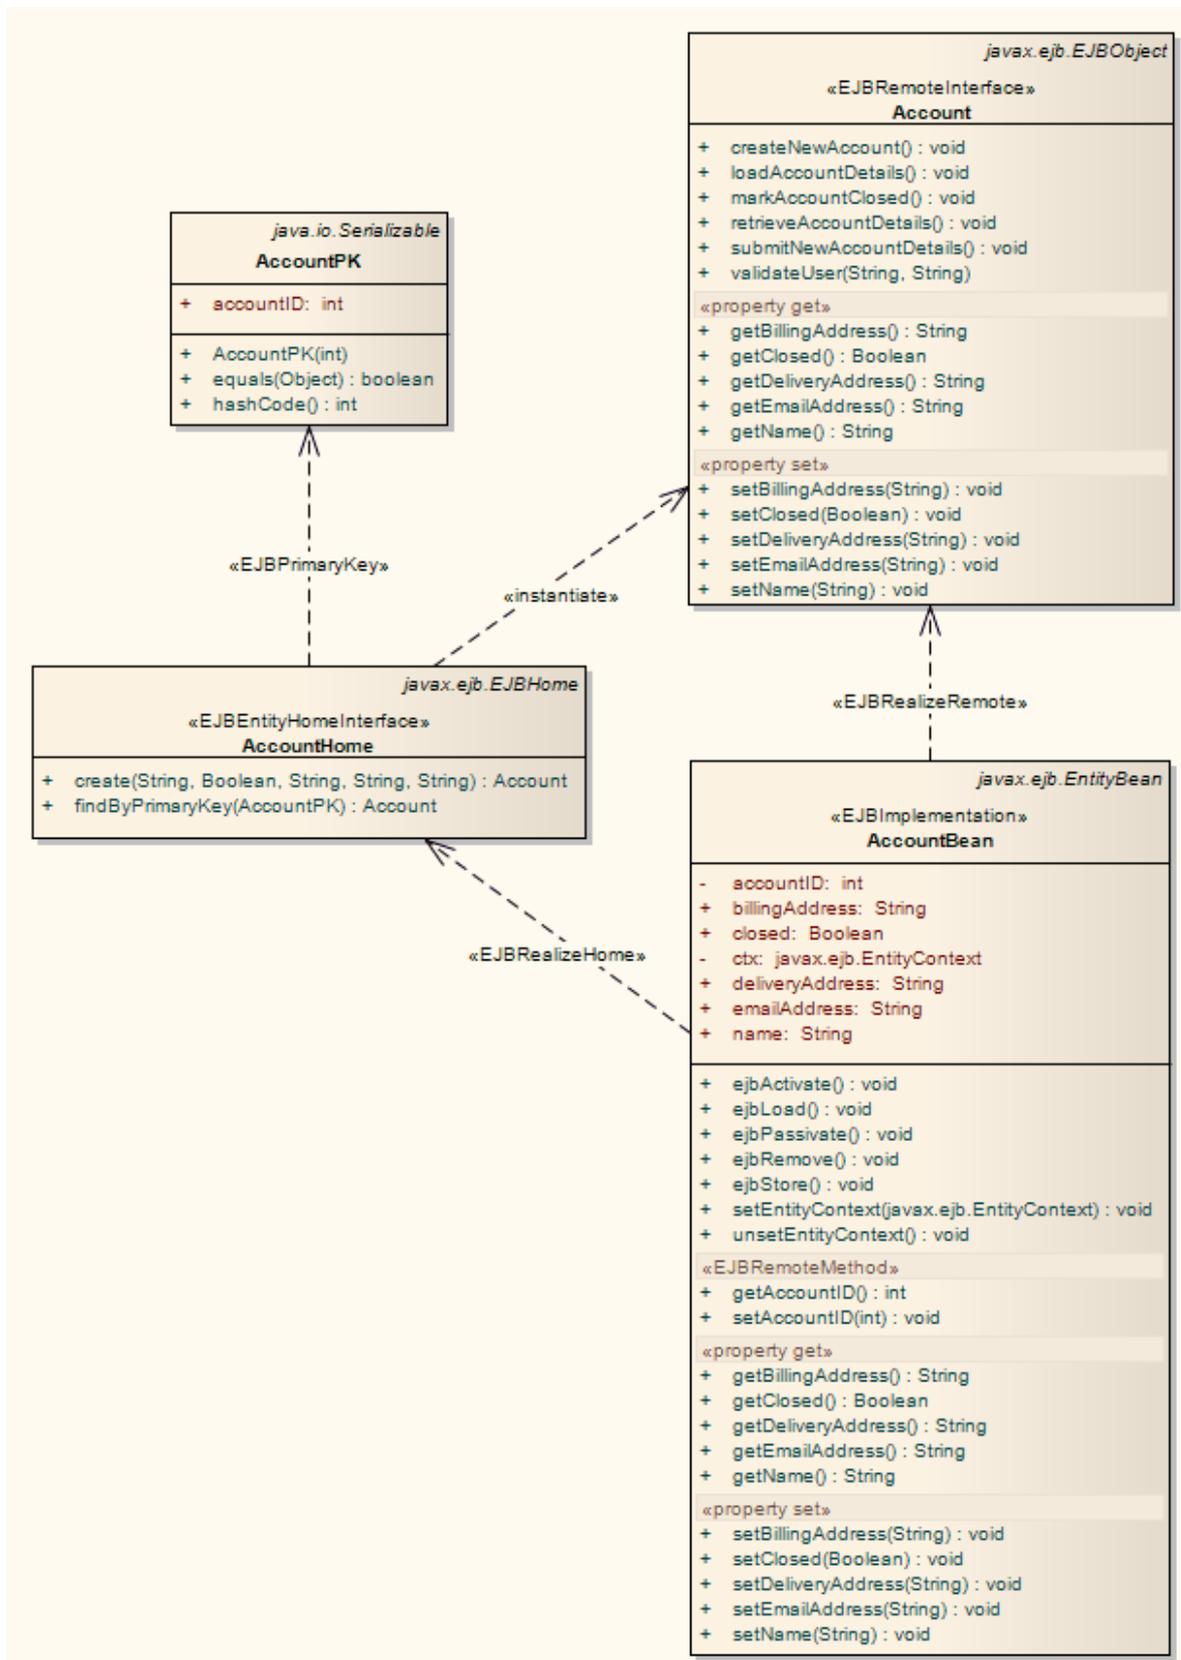

Both transformations also generate a META-INF package containing a deployment descriptor element.

Example:

The Platform-Independent Model (PIM):

After transformation generates a set of Entity Beans, where each one takes the following form (for the Account Class):

9.2.5 ERD To Data Model Transformation

The purpose of the **Entity Relationship Diagram (ERD) to Data Model transformation** is to create a data model from the ERD logical model, generating a model targeted at the default database type ready for DDL generation. Before doing the transformation, make sure you have defined the common data type for each attribute and selected a database type as the default database. The data modeling diagram can then be automatically generated. This data model can be used for generating DDL statements to run in one of the Enterprise Architect supported database products.

The transformation uses and demonstrates support in the intermediary language for the following database-specific concepts:

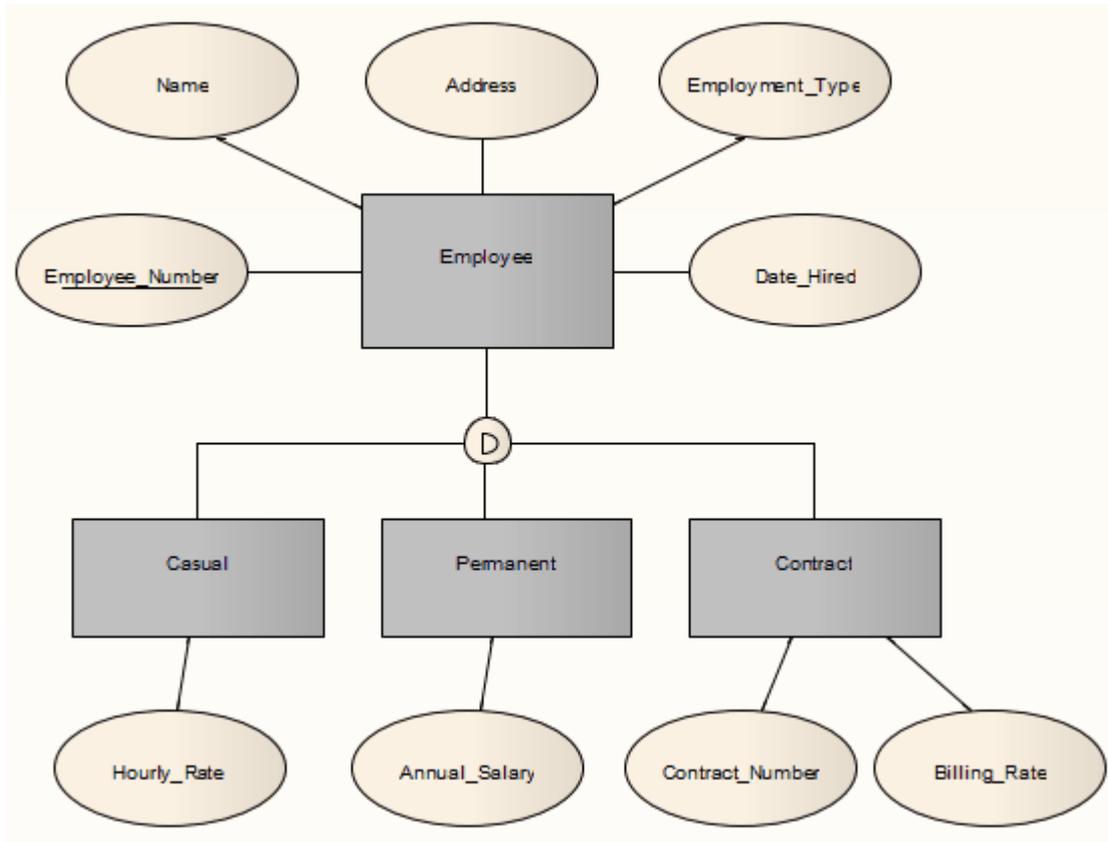

Reference:

Concept	Definition	See also
Table	Mapped one-to-one onto Class elements.	
Column	Mapped one-to-one onto attributes.	
Primary Key	Lists all the columns involved; this ensures that they exist in the Class and creates a primary key method for them.	
Foreign Key	This is a special sort of connector. The <i>Source</i> and <i>Target</i> sections list all of the columns involved; this ensures that they exist and that a matching primary key exists in the destination Class, and that the transformation creates the appropriate foreign key.	

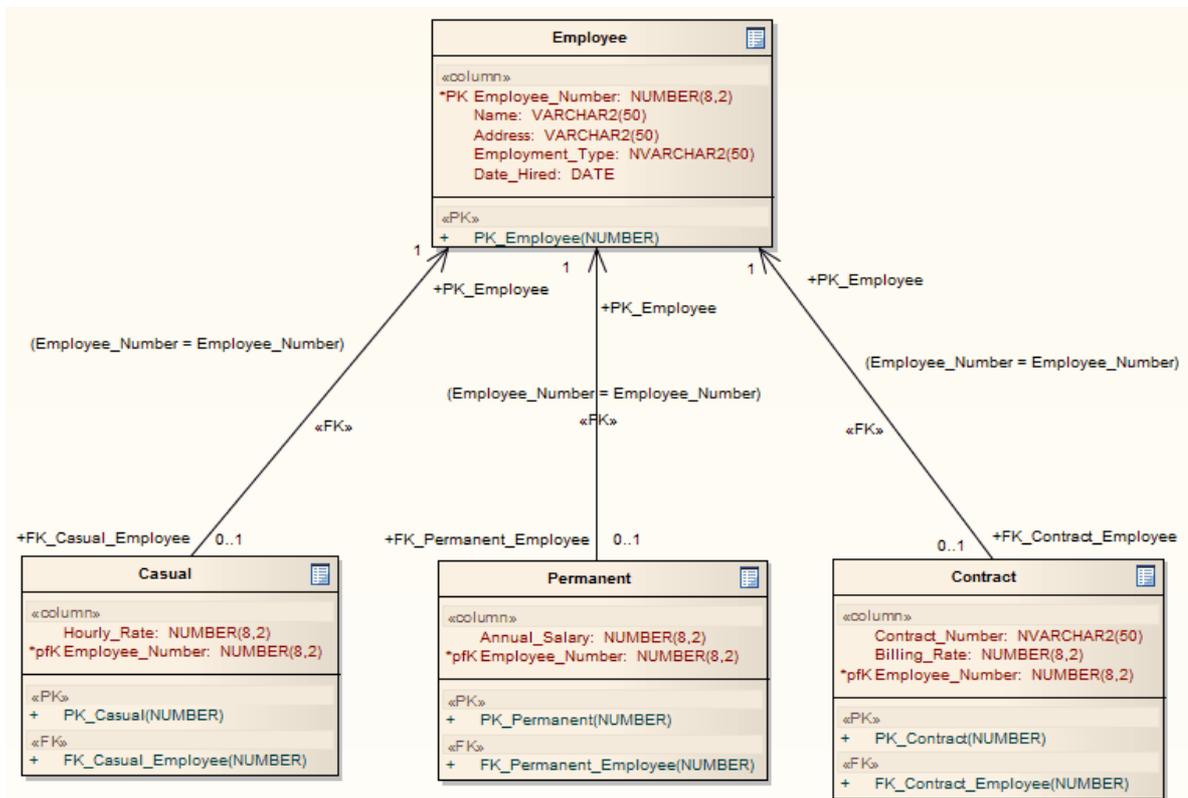

Generalization

Generalization can be handled in ERD technology, as illustrated by the following example. Note that the copy-down inheritance is currently supported with two levels only.

Example:

This transforms to:

Notes:

- Sometimes you might go back to the ERD, make some changes and then want to do another transformation. To achieve better results, always delete the previous transformation package before doing the next transformation

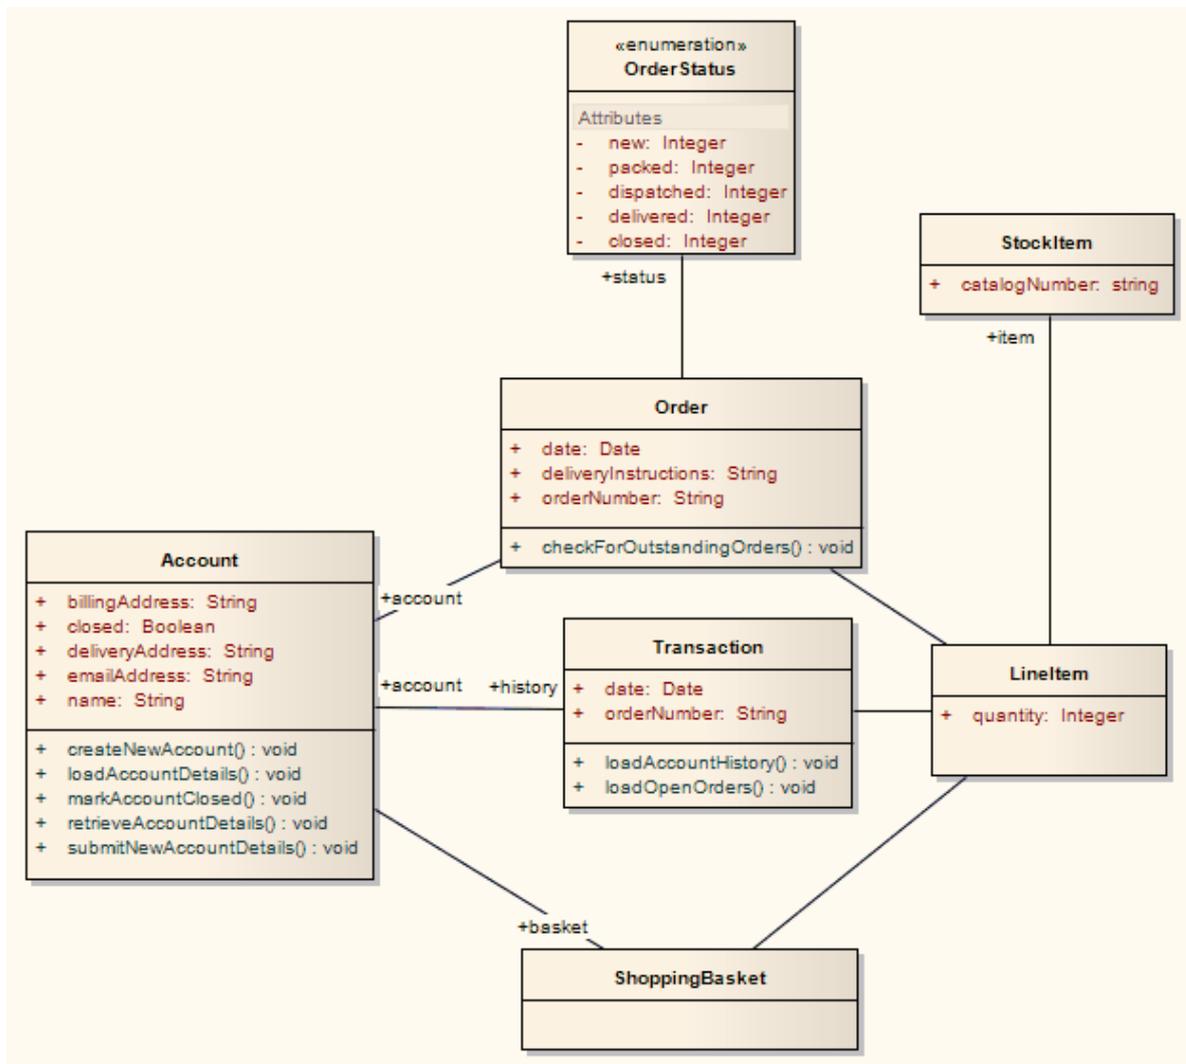

9.2.6 Java Transformation

The purpose of the **Java transformation** is to convert Platform-Independent Model (PIM) elements to language-specific Java Class elements. The transformation converts the PIM model types to Java types and creates encapsulation according to Enterprise Architect's options for creating properties from Java attributes; that is, producing the getters and setters according to the rules you have defined. Notice that the *public* attributes in the PIM are converted to *private* attributes in the PSM.

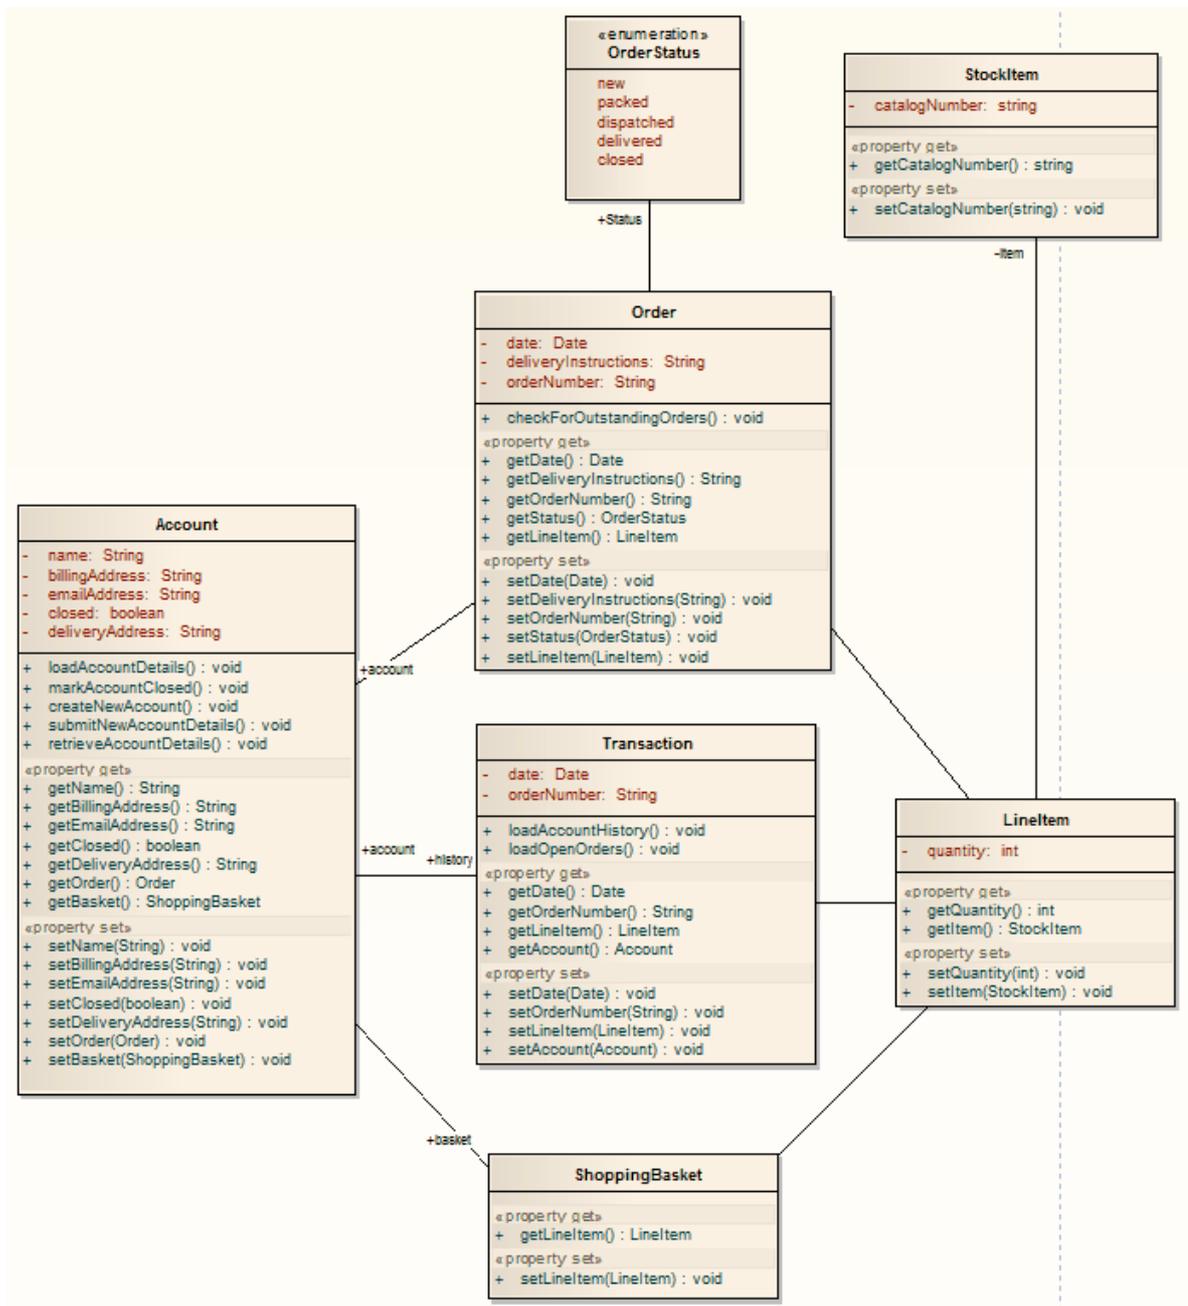

You set the code generation options for Java code generation on the **Java Specifications** page of the **Options** dialog.

Example:

The Platform-Independent Model (PIM):

After transformation becomes the PSM:

Learn More:

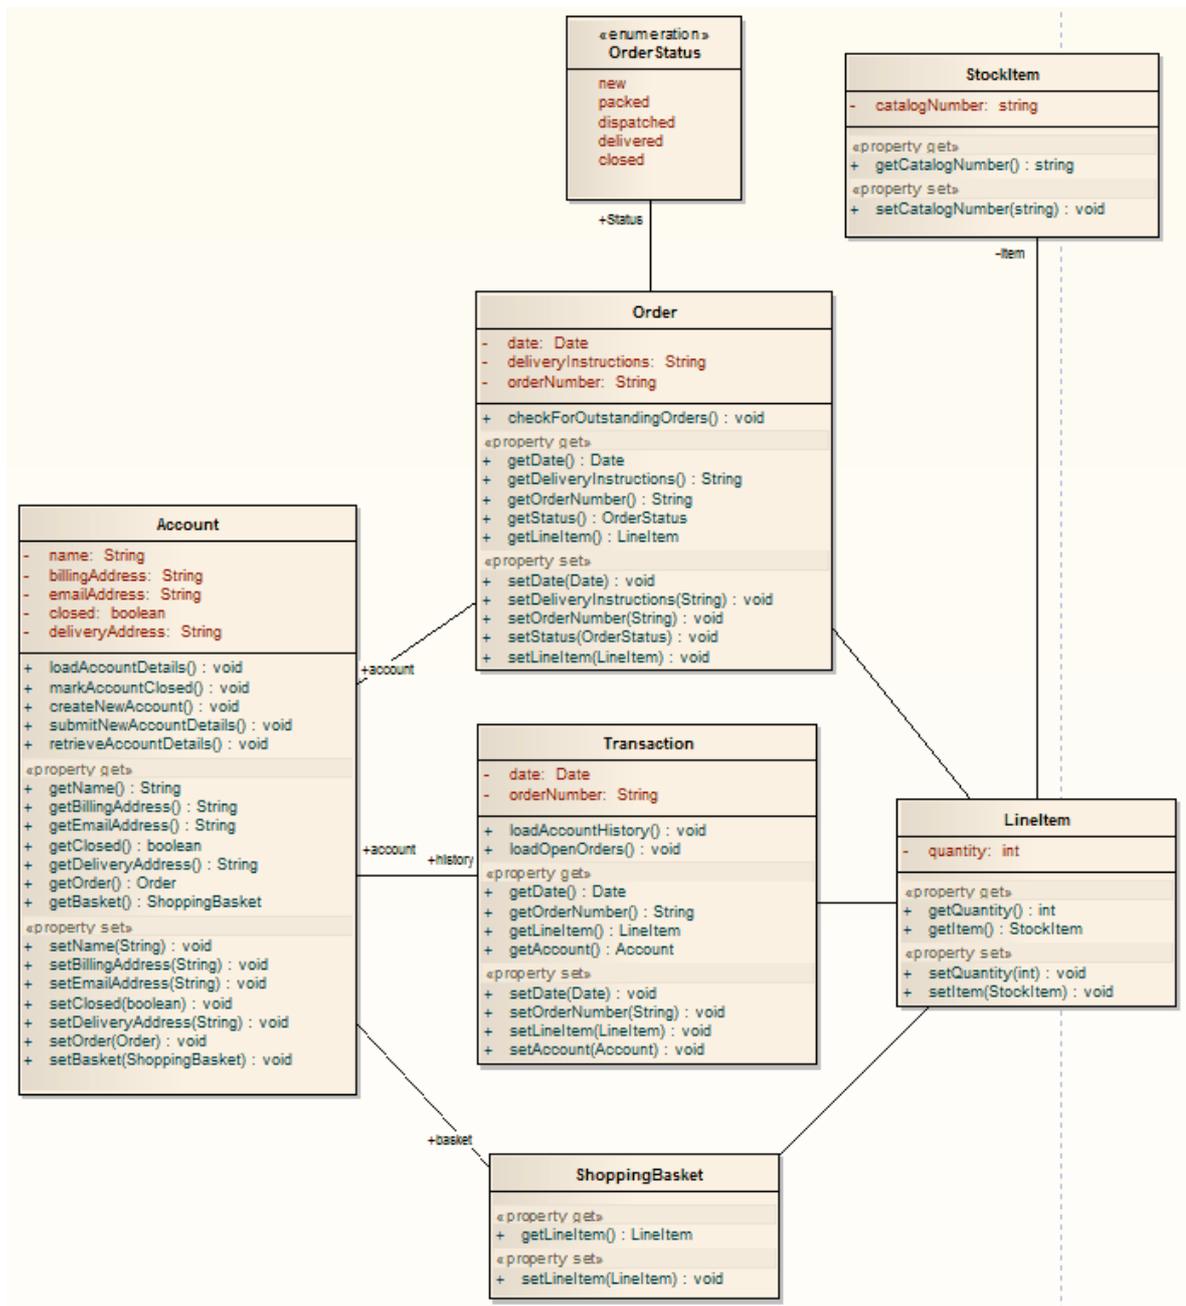

- [Java Options](#) 

9.2.7 JUnit Transformation

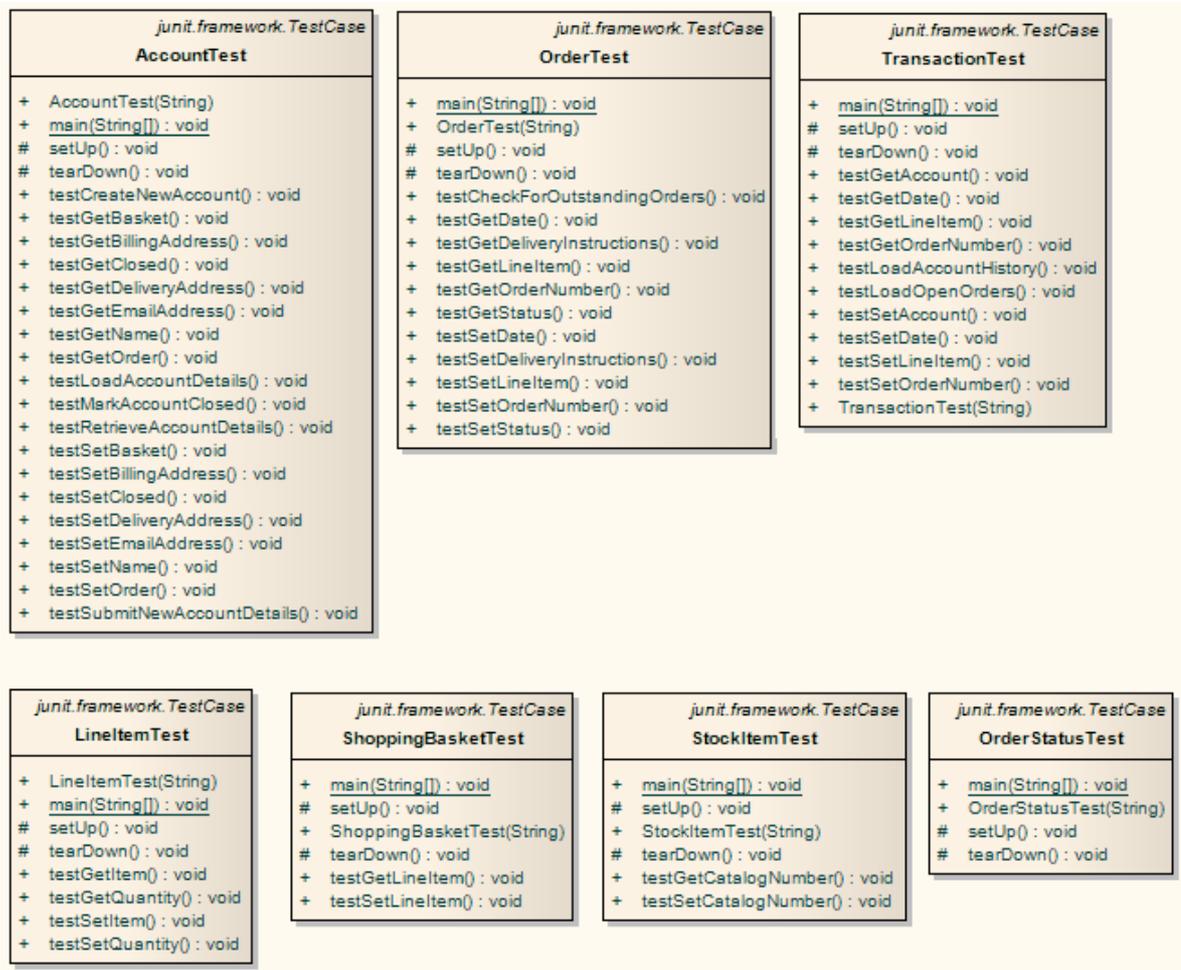

The purpose of the **JUnit transformation** is to create a Class with test methods for all public methods of an existing Java Class. The resulting Class can then be generated and the tests filled out and run by JUnit.

Example:

The Java model originally transformed from the PIM:

After transformation becomes the PSM:

Notes:

- Note that for each Class in the Java model, a corresponding test Class has been created. Each of these test Classes contains a test method for every public method in the source Class, plus the methods required to appropriately set up the tests. It is your responsibility to fill in the details of each test

Learn More:

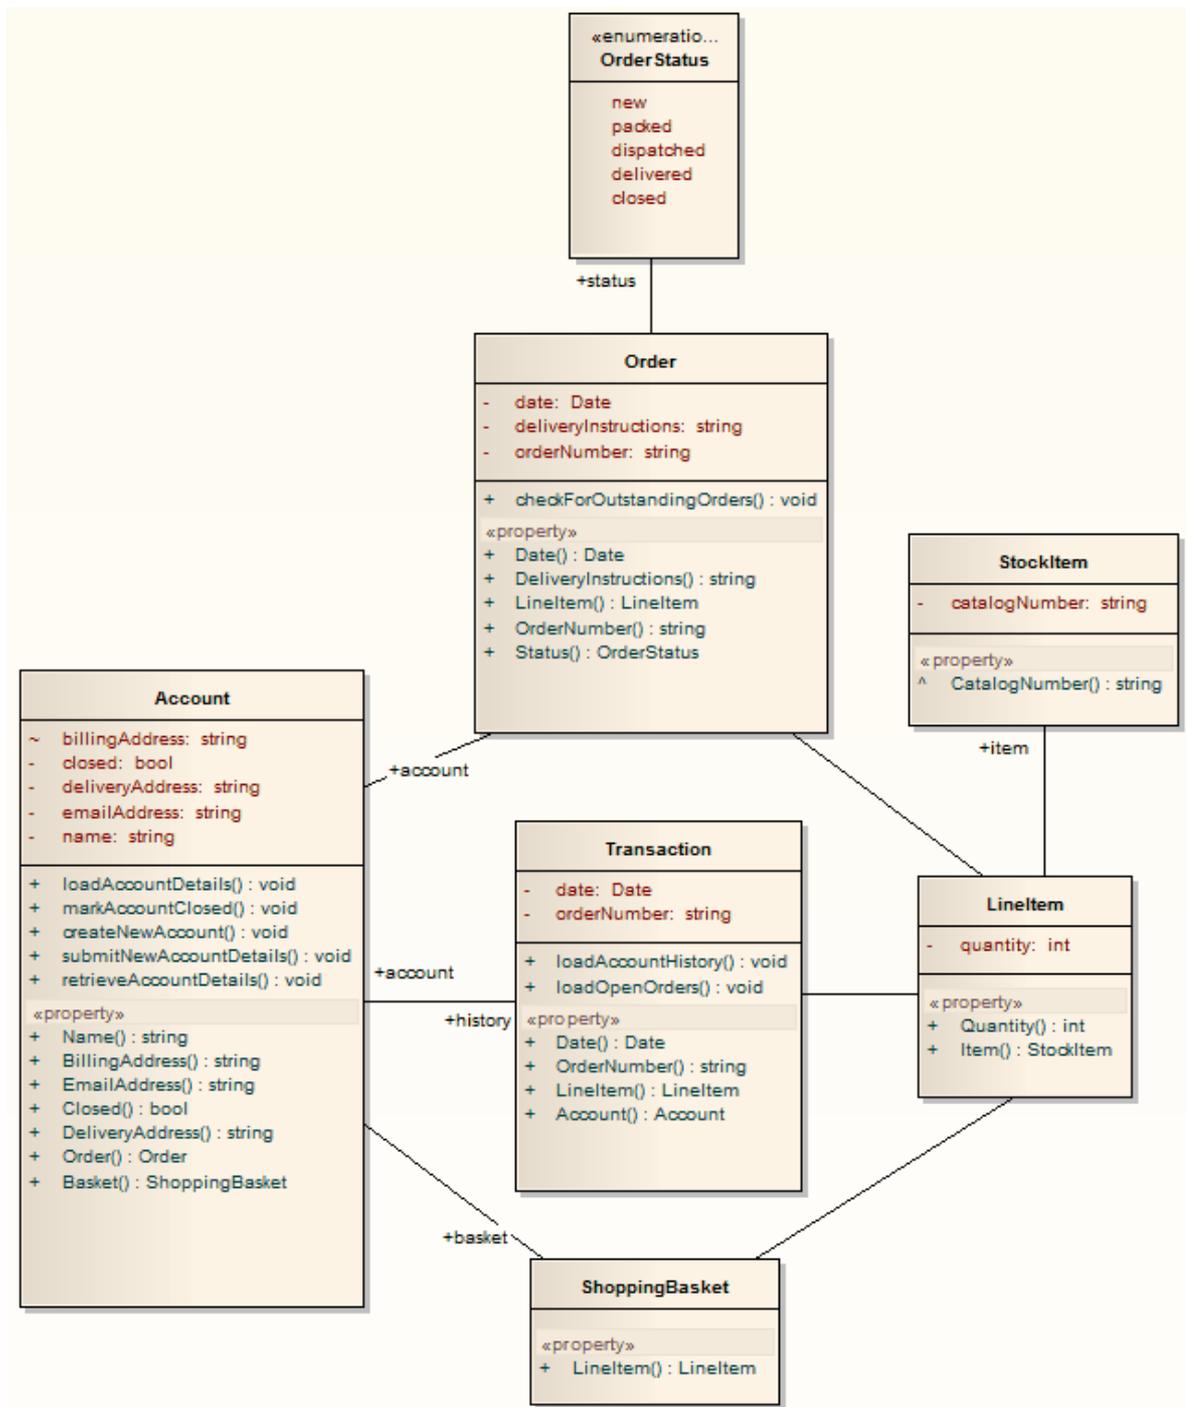

- [Unit Testing](#)^[1669]

9.2.8 NUnit Transformation

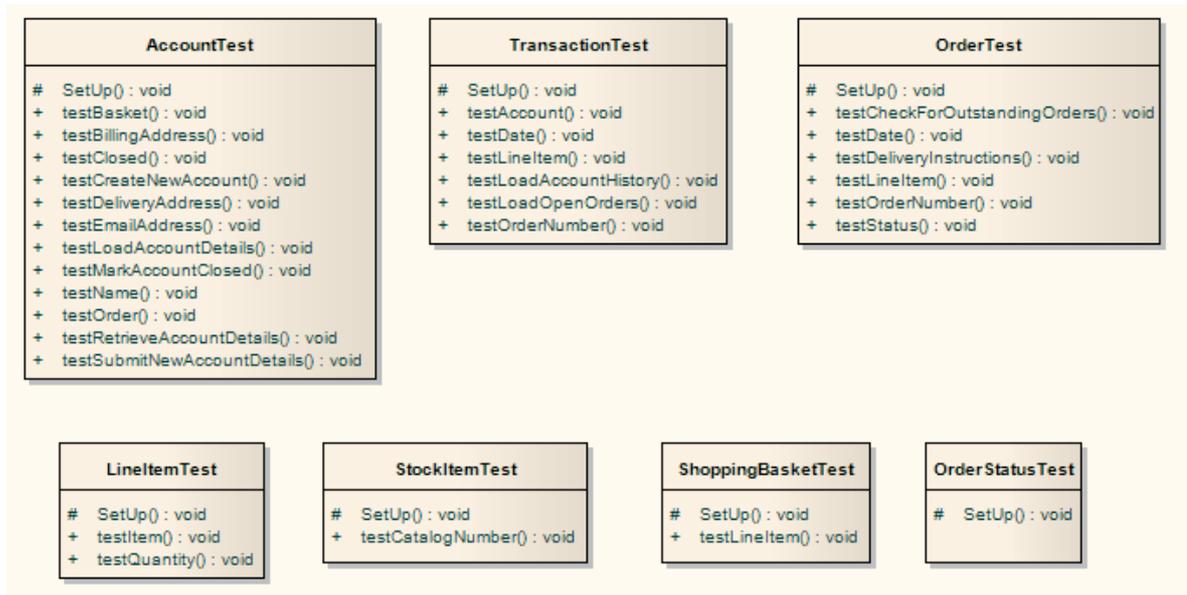

The purpose of the **NUnit transformation** is to create a Class with test methods for all public methods of an existing .Net compatible Class. The resulting Class can then be generated and the tests filled out and run by NUnit.

Example:

The C# model originally transformed from the PIM:

After transformation becomes the PSM:

Notes:

- Note that for each Class in the C# model, a corresponding test Class has been created. Each of these test Classes contains a test method for every public method in the source Class, plus the methods required to appropriately set up the tests. It is your responsibility to fill in the details of each test

Learn More:

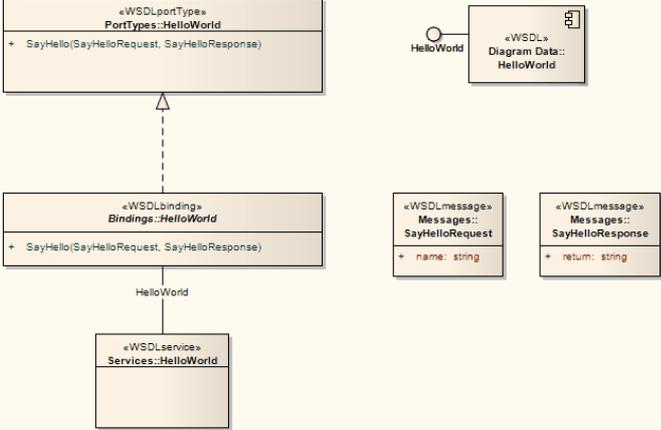

- [Unit Testing](#)^[1669]

9.2.9 WSDL Transformation

The purpose of the **WSDL transformation** is to create from a simple model an expanded model of a WSDL interface that is suitable for generation.

Topics:

Topic	Detail	See also
WSDL Transformation	<p>Take the following example interface:</p> <pre> classDiagram class HelloWorld { <<interface>> + SayHello(name :string) : string } </pre> <p>This generates the corresponding WSDL component, service, port type, binding and messages as follows.</p> <ul style="list-style-type: none"> • Classes are handled in the same way as the XSD 	<p>XSD Transformation^[1326]</p> <p>WSDL Generation^[1621]</p>

Topic	Detail	See also
	<p>Transformation</p> <ul style="list-style-type: none"> All <i>in</i> parameters are transformed into WSDL <i>Message Parts</i> in the <i>Request</i> message The return value and all <i>out</i> and <i>return</i> parameters are transformed into WSDL <i>Message Parts</i> in the <i>Response</i> message All methods where a value is returned are transformed into <i>Request-Response</i> operations while all methods not returning a value are transformed into <i>OneWay</i> operations The transformation does not handle generation of <i>Solicit-Response</i> and <i>Notification</i> methods or faults  <p>The resulting package can then have the specifics filled out using the WSDL editing capabilities of Enterprise Architect, and finally be generated using WSDL generation.</p>	

Learn More:

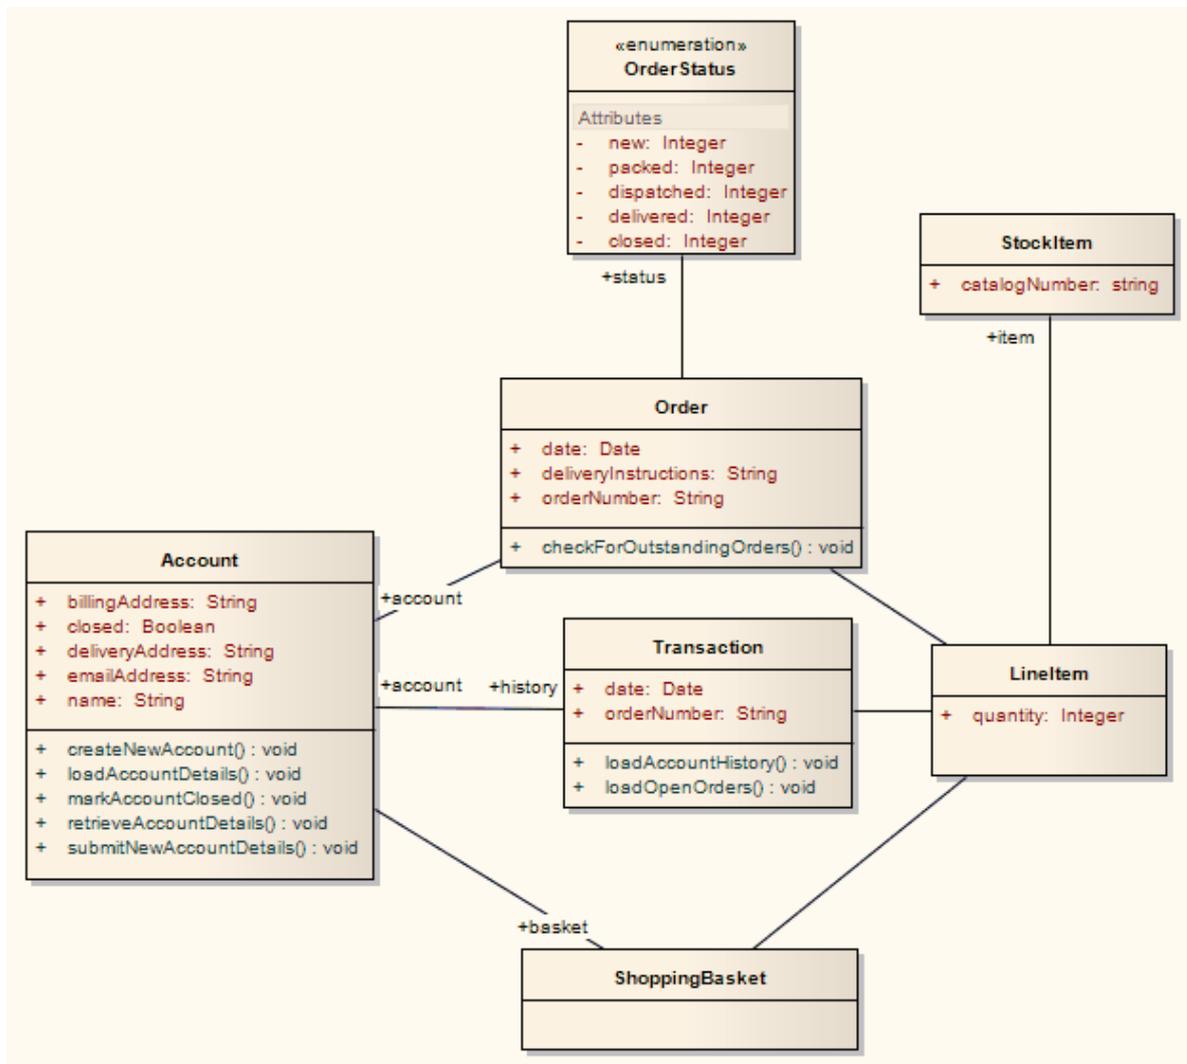

- [WSDL Model Structure](#) ^[1611]
- [Model WSDL](#) ^[1612]

9.2.10 XSD Transformation

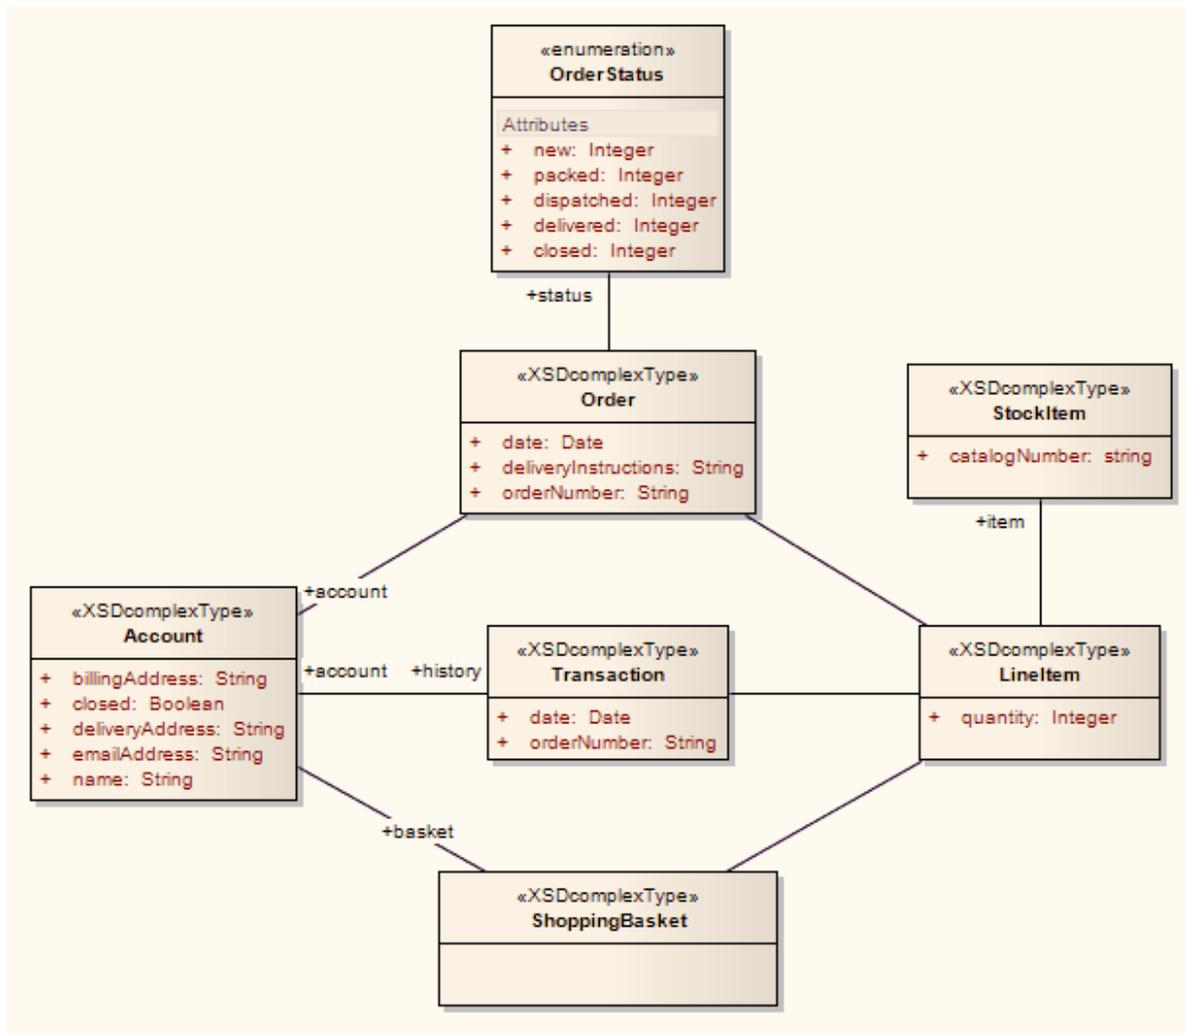

The purpose of the **XSD transformation** is to convert Platform-Independent Model (PIM) elements to UML Profile for XML elements as an intermediary step to creating an XML Schema. Each selected PIM Class element is converted to an «XSDcomplexType» element.

Example:

The Platform-Independent Model (PIM):

After transformation becomes the PSM:

Which in turn generates the following XSD:

```

<?xml version="1.0" encoding="ISO-8859-1" ?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema" >
  <xs:element name="Account" type="Account" />
  <xs:complexType name="Account" >
    <xs:sequence>
      <xs:element name="name" type="xs:string" />
      <xs:element name="billingAddress" type="xs:string" />
      <xs:element name="emailAddress" type="xs:string" />
      <xs:element name="closed" type="xs:boolean" />
      <xs:element name="deliveryAddress" type="xs:string" />
      <xs:element ref="Order" />
      <xs:element ref="ShoppingBasket" />
    </xs:sequence>
  </xs:complexType>
  <xs:element name="LineItem" type="LineItem" />
  <xs:complexType name="LineItem" >
    <xs:sequence>
      <xs:element name="quantity" type="xs:integer" />
      <xs:element ref="StockItem" />
    </xs:sequence>
  </xs:complexType>
  <xs:element name="Order" type="Order" />
  <xs:complexType name="Order" >
  
```

```

    <xs:sequence>
      <xs:element name="date" type="xs:date"/>
      <xs:element name="deliveryInstructions" type="xs:string"/
>
      <xs:element name="orderNumber" type="xs:string"/>
      <xs:element ref="LineItem"/>
      <xs:element name="status" type="OrderStatus"/>
    </xs:sequence>
  </xs:complexType>
  <xs:simpleType name="OrderStatus">
    <xs:restriction base="xs:string">
      <xs:enumeration value="new"/>
      <xs:enumeration value="packed"/>
      <xs:enumeration value="dispatched"/>
      <xs:enumeration value="delivered"/>
      <xs:enumeration value="closed"/>
    </xs:restriction>
  </xs:simpleType>
  <xs:element name="ShoppingBasket" type="ShoppingBasket"/>
  <xs:complexType name="ShoppingBasket">
    <xs:sequence>
      <xs:element ref="LineItem"/>
    </xs:sequence>
  </xs:complexType>
  <xs:element name="StockItem" type="StockItem"/>
  <xs:complexType name="StockItem">
    <xs:sequence>
      <xs:element name="catalogNumber" type="xs:string"/>
    </xs:sequence>
  </xs:complexType>
  <xs:element name="Transaction" type="Transaction"/>
  <xs:complexType name="Transaction">
    <xs:sequence>
      <xs:element name="date" type="xs:date"/>
      <xs:element name="orderNumber" type="xs:string"/>
      <xs:element ref="Account"/>
      <xs:element ref="LineItem"/>
    </xs:sequence>
  </xs:complexType>
</xs:schema>

```

Learn More:

- For more information, see the [Generate XSD](#) [1598] topic

9.3 Transformation Templates

Note that the Transformation Template mechanism is based very strongly on the Code Generation Template mechanism. For further information on Transformation Templates see the Code Template Editor section and also - for information on the Common Code Editor and intellisense - the Code Editors topic.

Access: [Settings | Transformation Templates](#)

To modify Transformation templates, follow the steps below

How To:

Step	Action	See also
1	Select the Settings Transformation Templates menu option. The Transformation Templates Editor displays.	
2	In the Language field, type or select the name of the transformation to modify.	
3	Select a template from the Templates list, and edit its contents in the editor pane.	
4	Click on the Save button.	

Reference:

Field	Usage	See also
Language	Select the name of the transformation.	
Template	Display the contents of the active template. Provide the editor for modifying templates.	
Templates	List the base transformation templates. The active template is highlighted. The Modified field indicates whether you have changed the default template for the current transformation.	
New Transformation Type	Create a new transformation.	
Stereotype Overrides	List the stereotyped templates, for the active base template. The Modified field indicates whether you have modified a default stereotyped template.	
Add New Stereotyped Override	Invoke a dialog for adding a stereotyped template, for the currently selected base template.	
Add New Custom Template	Invoke a dialog for creating a custom stereotyped template.	
Help	Launch the Enterprise Architect Help topic for this dialog.	
Get Default	Update the editor display with the default version of the active	

Field	Usage	See also
Template	template.	
Save	Overwrite the active templates with the contents of the editor.	
Delete	If you have overridden the active template, delete the override and replace it with the corresponding default transformation template.

9.3.1 Import Transformations

Access: Project | Model Import/Export | Import Reference Data

Use To:

- Transfer **Transformation templates** between models

To import a Transformation template, follow the steps below

How To:

Step	Action	See also
1	Select the Project Model Import/Export Import Reference Data menu option. The Import Reference Data dialog displays.	
2	Click on the Select File button and browse to a .XML file containing the required Transformation template.	
3	Select the name of one or more template datasets and click on the Import button.	

9.4 Write Transformations

This topic provides help in writing your own transformations. Subjects covered are:

Topic	Detail	See also
Default Transformation Templates	Enterprise Architect provides a set of default transformation templates to customize to your requirements	Default Transformation Templates ^[1332]
General Syntax for the Intermediary Language	Describes the grammar for the transformation	General Syntax for the Intermediary Language ^[1333]
Syntax for Creating Objects	Describes the syntax followed in creating objects or elements	Syntax for Creating Objects ^[1334]
Syntax for Creating Connectors	Describes the syntax followed in creating connectors	Syntax for Creating Connectors ^[1335]
Transforming Duplicate Information	Describes how information is copied during transformation	Transforming Duplicate Information ^[1340]
Converting Types	Describes methods for converting data types to different target platform types	Converting Types ^[1340]
Converting Names	Describes methods for converting names of elements to different target platform naming conventions	Converting Names ^[1341]
Cross References	Provides cross verification of transformed elements	Cross References ^[1342]
Code template Framework	Provides forward engineering of UML models	Code Template Framework ^[1482]
Code Editors	Provides the list of editors supported by Enterprise Architect	Code Editors ^[1394]

Notes:

- Further hints and tips can be gleaned from a close study of the Transformation Templates provided with Enterprise Architect; writing transformations is very similar to writing code generation templates, so an understanding of the Code Template Framework can greatly assist in understanding transformations
- The Transformation Template editor provides the facilities of the Common Code Editor
- Transformation Templates are accessed from the **Settings | Transformation Templates** menu option

9.4.1 Default Transformation Templates

In most transformations, there is a lot of information that is simply copied to the target model. In order to make writing new transformations simpler, Enterprise Architect provides a default set of transformation templates. These templates perform a simple copy of the source model to the target model. This means that in order to write a new transformation you can modify the default templates to make the required changes.

Notes:

- When creating a new transformation you must modify at least one template before the transformation becomes available

9.4.2 Intermediary Language

All transformations in Enterprise Architect work by generating an intermediary text form of the model to generate.

Topics:

Topic	Detail	See also
Usage	<p>Any element is represented in this language by the type of element (for example, Class, Action, Method, Generalization or Tag) followed by the properties of the element and the elements that it is made from; the grammar for this resembles the following:</p> <pre> element : element Name { (element Property element) * } element Property: packageName stereotype propertyName = " propertyValueSymbol * " packageName: name = " propertyValueSymbol * " (. " propertyValueSymbol * ") * stereotype: stereotype = " propertyValueSymbol * " (, " propertyValueSymbol * ") * propertyValueSymbol : \ \ \ " Any character except " (U+0022), \ (U+005C) • <i>elementName</i> is any one of the set of element types • <i>propertyName</i> is any one of the set of properties Literal strings can be included in property values by escaping a quote character; for example: default = "\" Some string value.\""</pre>	<p>Objects <small>[1333]</small></p> <p>Connectors <small>[1338]</small></p>

9.4.3 Objects

Topics:

Topic	Detail	See also
Objects	<p>Objects are created in Enterprise Architect by generating text in the following form:</p> <pre> object Type { object Properties } where:</pre>	<p>XRef element <small>[1342]</small></p>

Topic	Detail	See also
	<p>obj ect Type is one of the following object types:</p> <ul style="list-style-type: none"> • <i>Action</i> • <i>ActionPin</i> • <i>Activity</i> • <i>ActivityParameter</i> • <i>ActivityPartition</i> • <i>ActivityRegion</i> • <i>Actor</i> • <i>Association</i> • <i>Change</i> • <i>Class</i> • <i>Collaboration</i> • <i>CollaborationUse</i> • <i>Component</i> • <i>DeploymentSpecification</i> • <i>DiagramFrame</i> • <i>Decision</i> • <i>EntryPoint</i> • <i>Event</i> • <i>ExceptionHandler</i> • <i>ExecutionEnvironment</i> • <i>ExitPoint</i> • <i>ExpansionNode</i> • <i>ExpansionRegion</i> • <i>ExposedInterface</i> • <i>GUIElement</i> • <i>InteractionFragment</i> • <i>InteractionOccurrence</i> • <i>InteractionState</i> • <i>Interface</i> • <i>InterruptibleActivityRegion</i> • <i>Issue</i> • <i>Iteration</i> • <i>Object</i> • <i>ObjectNode</i> • <i>MessageEndpoint</i> • <i>Node</i> • <i>Package</i> • <i>Parameter</i> • <i>Part</i> • <i>Port</i> • <i>ProvidedInterface</i> • <i>RequiredInterface</i> • <i>Requirement</i> • <i>Sequence</i> • <i>State</i> • <i>StateMachine</i> • <i>StateNode</i> • <i>Synchronization</i> • <i>Table</i> • <i>TimeLine</i> 	

Topic	Detail	See also
	<ul style="list-style-type: none"> • <i>Trigger</i> • <i>UMLDiagram</i> • <i>UseCase</i> <p>objectProperties is zero, or one or more of the following properties:</p> <ul style="list-style-type: none"> • <i>Abstract</i> • <i>Alias</i> • <i>Arguments</i> • <i>Author</i> • <i>Cardinality</i> • <i>Classifier</i> • <i>Complexity</i> • <i>Concurrency</i> • <i>Filename</i> • <i>Header</i> • <i>Import</i> • <i>IsActive</i> • <i>IsLeaf</i> • <i>IsRoot</i> • <i>IsSpecification</i> • <i>Keyword</i> • <i>Language</i> • <i>Multiplicity</i> • <i>Name</i> • <i>Notes</i> • <i>Persistence</i> • <i>Phase</i> • <i>Scope</i> • <i>Status</i> • <i>Stereotype</i> • <i>Version</i> • <i>Visibility</i> <p>and zero, or one or more of the following elements:</p> <ul style="list-style-type: none"> • <i>Attribute</i> • <i>Classifier</i> • <i>Parameter</i> • <i>Operation</i> • <i>Parent</i> • <i>Tag</i> • <i>XRef</i> • <i>Any object</i> <ul style="list-style-type: none"> • Some of the above only apply to certain object types • Every object created in a transformation should include an XRef element, as it enables Enterprise Architect to synchronize with the element and makes it possible to create a connector to that Class in a transformation 	
Classes	<p>A simple Class can be created as follows:</p> <pre>Cl ass</pre>	

Topic	Detail	See also
	<pre> { name = " Example" } </pre> <p>It is then easy to add to this; the following example sets the language to C++, and adds a Tagged Value and an attribute:</p> <pre> Class { name = " Example" language = " C++" Tag { name = " default CollectionClass" value = " List" } Attribute { name = " count" type = " int" } } </pre>	
Attributes	<p>Attributes are created with the same structure as objects, and include the following properties:</p> <ul style="list-style-type: none"> • <i>Alias</i> • <i>Classifier</i> • <i>Collection</i> • <i>Container</i> • <i>Containment</i> • <i>Constant</i> • <i>Default</i> • <i>Derived</i> • <i>LowerBound</i> • <i>Name</i> • <i>Notes</i> • <i>Ordered</i> • <i>Scope</i> • <i>Static</i> • <i>Stereotype</i> • <i>Type</i> • <i>UpperBound</i> • <i>Volatile</i> <p>and the following elements:</p> <ul style="list-style-type: none"> • <i>Classifier</i> • <i>Tag</i> • <i>XRef</i> 	
Operations	<p>Operations are created with the same structure as objects, and include the following properties:</p> <ul style="list-style-type: none"> • <i>Abstract</i> • <i>Alias</i> • <i>Behavior</i> • <i>Classifier</i> • <i>Code</i> • <i>Constant</i> 	

Topic	Detail	See also
	<ul style="list-style-type: none"> • <i>IsQuery</i> • <i>Name</i> • <i>Notes</i> • <i>Pure</i> • <i>ReturnArray</i> • <i>Scope</i> • <i>Static</i> • <i>Stereotype</i> • <i>Type</i> <p>and the following elements:</p> <ul style="list-style-type: none"> • <i>Classifier</i> • <i>Parameter</i> • <i>Tag</i> • <i>XRef</i> 	
Parameters	<p>Parameters are created with the same structure as objects, and include the Tag element and the following properties:</p> <ul style="list-style-type: none"> • <i>Classifier</i> • <i>Default</i> • <i>Fixed</i> • <i>Name</i> • <i>Notes</i> • <i>Kind</i> • <i>Stereotype</i> 	
Packages	<p>Packages differ from other objects in the following ways:</p> <ul style="list-style-type: none"> • A reduced set of properties of <i>alias</i>, <i>author</i>, <i>name</i>, <i>namespaceRoot</i>, <i>notes</i>, <i>scope</i>, <i>stereotype</i> and <i>version</i> • The extra property <i>namespaceRoot</i> • Must have a name specified • <i>Name</i> can be a qualified name; when a qualified name is specified the properties given are applied only to the final package • Can contain other packages • Can't contain attributes and operations 	
Tables	<p>Tables are a special sort of object, with the following differences from other object types:</p> <ul style="list-style-type: none"> • Can include columns and primary keys • Cannot include attributes 	
Columns	<p>Columns are similar to attributes, but have an <i>autonumber</i> element containing <i>Startnum</i> and increment, and the following added properties:</p> <ul style="list-style-type: none"> • <i>Length</i> • <i>NotNull</i> • <i>Precision</i> • <i>PrimaryKey</i> • <i>Scale</i> • <i>Unique</i> <p>In the column definition, you cannot assign a value to the <i>NotNull</i>, <i>PrimaryKey</i> or <i>Unique</i> properties</p>	

9.4.4 Connectors

Creating connectors in a transformation can be complex, but the process has the same form as creating elements. The difference is that you must also specify each end.

Topics:

Topic	Detail	See also
Connector Types	<p>The different connectors that can be created are as follows:</p> <ul style="list-style-type: none"> • Aggregation • Assembly • Association • Collaboration • ControlFlow • Connector • Delegate • Dependency • Deployment • ForeignKey • Generalization • InformationFlow • Instantiation • Interface • InterruptFlow • Manifest • Nesting • NoteLink • ObjectFlow • Package • Realization • Sequence • Transition • UseCase • Uses <p>There are two different types of Class that you can use as a connector end: one created by a transformation, and one for which you already know the GUID</p>	
Connect to a Class Created by a Transformation	<p>The most common connection is to connect to a Class created by a transformation; to do this you must have three items of information:</p> <ul style="list-style-type: none"> • The original Class GUID • The name of the transformation • The name of the transformed Class <p>This type of connector is created using the TRANSFORM_REFERENCE function macro; when the element is in the current transformation, it can be safely omitted from the transformation</p> <p>The simplest example of this is when you have created multiple Classes from a single Class in a transformation and want a connector between them; consider this example from the EJB Entity transformation:</p> <pre> Dependency { </pre>	Cross References <small>[1342]</small>

Topic	Detail	See also
	<pre> %TRANSFORM_REFERENCE(" EJBReal i zeHome" , classGUI D) % st ereot ype=" EJBReal i zeHome" Source { %TRANSFORM_REFERENCE(" EJBEnt i tyBean" , classGUI D) % } Target { %TRANSFORM_REFERENCE(" EJBHomeI nt erface" , classGUI D) % } } </pre> <p>There are three uses of the TRANSFORM_REFERENCE macro: one to identify this connector for synchronization purposes and the other two to identify the ends; all three use the same source GUID, because they all come from the one original Class</p> <p>None of the three have to specify the transformation because the two references are referencing something in the current transformation - each of them then only has to identify the transform name</p> <p>Of course, it is also possible to create a connector from another connector</p> <p>You can create a connector template and list over all connectors connected to a Class from the Class level templates; you don't have to worry about only generating it once, because if you have created a TRANSFORM_REFERENCE for the connector then Enterprise Architect automatically synchronizes them</p> <p>The following copies the source connector:</p> <pre> %connector Type% { %TRANSFORM_CURRENT() % %TRANSFORM_REFERENCE(" Connector" , connector GUI D) % Source { %TRANSFORM_REFERENCE(" Cl ass" , connector Sour ceGUI D) % %TRANSFORM_CURRENT(" Sour ce") % } Target { %TRANSFORM_REFERENCE(" Cl ass" , connector Dest GUI D) % %TRANSFORM_CURRENT(" Tar get ") % } } </pre>	
<p>Connecting to a Class for which you know the GUID</p>	<p>The second type of Class that you can use as a connector end is one for which you know the current GUID</p> <p>To do this, specify the GUID of the target Class in either the source or target end; the following example creates a dependency from a Class created in a transformation, to the Class it was transformed from:</p> <pre> Dependency { %TRANSFORM_REFERENCE(" Sour ceDependency" , classGUI D) % st ereot ype=" t ransf or medFr om" Source { </pre>	

Topic	Detail	See also
	<pre> %TRANSFORM_REFERENCE(" Cl ass" , cl ass GUI D) % } Target { GUI D=%qt %%c l ass GUI D%%qt % } </pre>	

Notes:

- *ForeignKey* is a special case where not just a connector is created - you must also list the columns involved in the transformation; in addition, tags specified on the connector are actually created on the foreign key operation in the source Class, and a cascade property can be added - for example, *cascade="update","delete"*
- Also, the *nullable* property of the foreign key is set to **true** if either end has a multiplicity that includes zero; this can be overridden by setting *nullable="1"* or *nullable="0"* in the source section of the foreign key
- Each connector is transformed at both end objects, therefore the connector might appear twice in the transformation; this is nothing to be concerned about, but you should check carefully that the connector is generated exactly the same way, regardless of which end is on the current Class

9.4.5 Copy Information

In many transformations there is a substantial amount of information to be copied.

It would be tedious to type all of the common information into a template so that it is copied to the transformed Class; the alternative is to use the **TRANSFORM_CURRENT** function macro.

Reference:

Topic	Detail	See also
TRANSFORM_CURRENT	<p>TRANSFORM_CURRENT(<listOfExcludedItems>)</p> <p>The function generates an exact copy of all the properties of the current item, except for the items named in <i><listOfExcludedItems></i></p> <p>Another form of the function is available when transforming connectors that enables either end of the connector to be copied:</p> <p>TRANSFORM_CURRENT(<connectorEnd>,<listOfExcludedItems>)</p> <p>This generates an exact copy of the connector end specified by <i><connectorEnd></i> except for the items named in <i><listOfExcludedItems></i>, where <i><connectorEnd></i> is either Source or Target</p>	

9.4.6 Convert Types

Topics:

Topic	Detail	See also
Synopsis	Different target platforms almost certainly require different data types, so you often require a method of converting between types, as offered by the following macro:	

Topic	Detail	See also
	<ul style="list-style-type: none"> • CONVERT_TYPE(<i><destinationLanguage></i>, <i><originalType></i>) <p>This function converts <i><originalType></i> to the corresponding type in <i><destinationLanguage></i>, using the datatypes and common types defined in the model, where <i><originalType></i> is assumed to be a platform independent common type</p> <p>A similar macro is available when transforming common datatypes to the datatypes for a specified database:</p> <ul style="list-style-type: none"> • CONVERT_DB_TYPE(<i><destinationDatabase></i>, <i><originalType></i>) <p>This function converts <i><originalType></i> to the corresponding datatypes in <i><destinationDatabase></i>, which is defined in the model; <i><originalType></i> refers to a platform independent common datatype</p>	

9.4.7 Convert Names

Different target platforms use different naming conventions. As a result you might not want to copy the names of your elements directly into the transformed models. To facilitate this requirement, Enterprise Architect's transformation templates provide a CONVERT_NAME function macro.

Another way in which you can transform a name is to remove a prefix from the original name, with the REMOVE_PREFIX macro.

Topics:

Topic	Detail	See also
CONVERT_NAME <i><originalName></i> , <i><originalFormat></i> , <i><targetFormat></i>)	<p>This macro converts <i><originalName></i>, which is assumed to be in <i><originalFormat></i>, to <i><targetFormat></i>.</p> <p>The supported formats are:</p> <ul style="list-style-type: none"> • Camel Case: New words start with a capital letter except for the first word, which begins with a lower case letter; for example, <i>myVariableTable</i> • Pascal Case: Same as Camel Case but the first letter of the first word is upper case; for example, <i>MyVariableTable</i> • Spaced: Words are separated by spaces; the case of letters is ignored • Underscored: Words are separated by underscores; the case of letters is ignored <p>The original format might also specify a list of delimiters to be used. For example a value of ' _ ' breaks words whenever either a space or underscore is found.</p> <p>The target format might also use a format string that specifies the case for each word and a delimiter between them. It takes the following form:</p> <p><i><firstWord></i>(<i><delimiter></i>)<i><otherWords></i></p> <ul style="list-style-type: none"> • <i><firstWord></i> controls the case of the first word (see below) • <i><delimiter></i> is the string generated between words • <i><otherWords></i> applies to all words after the first 	

Topic	Detail	See also
	<p>word</p> <p><<i>firstWord</i>> and <<i>otherWords</i>> are both a sequence of two characters. The first character represents the case of the first letter of that word, and the second character represents the case of all subsequent letters. An upper case letter forces the output to upper case, a lower case letter forces the output to lower case, and any other character preserves the original case.</p> <p>Example 1: To capitalize the first letter of each word and separate multiple words with a space:</p> <p>" Ht () Ht " to output " My Var i abl e Tabl e "</p> <p>Example 2: To generate the equivalent of Camel Case, but reverse the roles of upper and lower case; that is, all characters are upper case except for the first character of each word <i>after</i> the first word:</p> <p>" HT() hT " to output " MY vARI ABLE t ABLE "</p>	
REMOVE_PREFIX (< <i>originalName</i> >, < <i>prefixes</i> >)	<p>This macro removes any prefix found in <<i>prefixes</i>> from <<i>originalName</i>>. The prefixes are specified in a semi-colon separated list.</p> <p>The macro is often used in conjunction with the <i>CONVERT_NAME</i> macro. For example, this code creates a get <i>property name</i> according to the options for Java.</p> <pre>\$pr oper t yName=%REMOVE_PREFIX(at t Name , genOpt Pr oper t yPr ef i x) % %i f genOpt GenCapi t al i sedPr oper t i es==" T" % \$pr oper t yName=%CONVERT_NAME (\$pr oper t yName, " camel case", " pascal case") % %endI f %</pre>	

Notes:

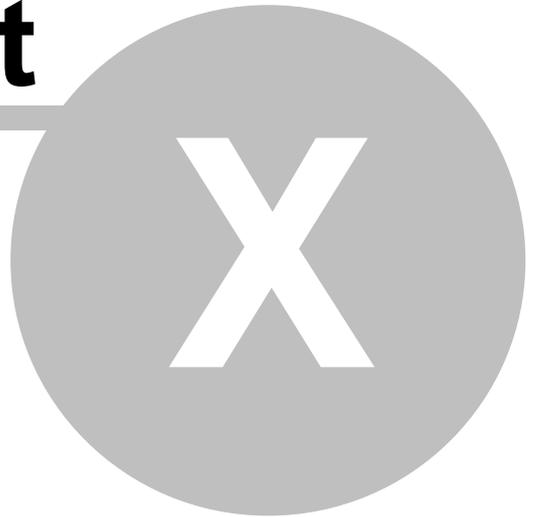

- Acronyms are not supported when converting from Camel Case or Pascal Case

9.4.8 Cross References**Topics:**

Topic	Detail	See also
Abstract	<p>Cross References are an important part of transformations. They are used to:</p> <ul style="list-style-type: none"> • Find the transformed Class to synchronize with • Create connectors between transformed Classes • Specify a classifier of a type • Determine where to transform to for future transformations <p>Each cross reference has three different parts:</p> <ul style="list-style-type: none"> • A <i>Namespace</i>, corresponding to the transformation that generated the element 	<p>DDL Transformation [1310]</p>

Topic	Detail	See also
	<ul style="list-style-type: none"> • A <i>Name</i>, which is a unique reference to something that can be generated in the above transformation • A <i>Source</i>, which is the GUID of the element that this element was created from <p>When writing the templates for a transformation, it is easiest to create the cross references using the TRANSFORM_REFERENCE macro that is defined for this purpose. It has three optional parameters.</p> <p>TRANSFORM_REFERENCE(<name>, <sourceGuid>, <namespace>)</p> <p>Generates a reference that can be used in the ways described above. It resembles the following.</p> <pre>XRef{namespace="<namespace>" name="<name>" source="<sourceGuid>"</pre> <p>Where:</p> <ul style="list-style-type: none"> • If <name> is not specified it gets the name of the current template • If <sourceGUID> is not specified it gets the GUID of the current Class • If <namespace> is not specified it gets the name of the current transformation <p>The only time that this should be specified is when creating a connector to a Class created in a different transformation.</p> <p>A good example of the use of cross references is in the DDL templates provided with Enterprise Architect. In the Class template a cross reference is created with the name table. Then up to two different connectors can be created, each of which must identify the two Classes it connects using cross references while having its own unique cross reference.</p>	
Specify Classifiers	<p>Objects, attributes, operations and parameters can all reference another element in the model as their type. When this type is created from a transformation you must use a cross reference to specify it, using the TRANSFORM_CLASSIFIER macro.</p> <p>TRANSFORM_CLASSIFIER(<name>, <sourceGuid>, <namespace>)</p> <p>Generates a cross reference within a classifier element, where the parameters are identical to the TRANSFORM_REFERENCE macro but the name Classifier is generated instead of <i>XRef</i>.</p> <p>If the target classifier already exists in the model before the transformation, a TRANSFORM_CLASSIFIER is inappropriate and instead the GUID can be given directly to a classifier attribute.</p> <p>If a classifier is specified for any type it overrides the type specified.</p>	

Part

10 Database Engineering

This section describes database engineering, explaining:

- How to import database schema, and
- How to generate DDL for the model

- [Import database schema](#)^[1375]
- [Generate DDL](#)^[1379]
- [Physical Data Modeling](#)^[1346]

10.1 Physical Data Model

The Physical data model visually represents the structure of the data as implemented by a relational database schema.

Topics:

Topic	Detail	See also
Benefit	In addition to providing a visual abstraction of the database structure, an important benefit of defining a Physical data model is that you can automatically derive the database schema from the model; this is possible due to the richness of meta-data captured by a Physical data model and its close mapping to aspects of the database schema, such as tables, columns, primary and foreign keys	
Example	<p>The following is an example of a Physical data model that could be used to automatically generate a database schema</p> <p>Each table is represented by a UML Class; columns, including Primary and Foreign Keys, are modeled using UML Attributes and Operations</p>  <p>A Physical data model defined using a UML Profile and the Information Engineering notation</p> <p>The above model is defined using Enterprise Architect's <i>UML Profile for Data Modeling</i>; the relationship between the tables uses the Information Engineering notation</p> <p>Information Engineering is one of three notations that Enterprise Architect supports to help Data Modelers distinguish cardinality in relationships</p>

10.1.1 Tables and Columns

The basic structural element of a relational database is the *table*, which represents a set of records, or rows, that have the same structure. Each row contains one or more *columns*. Every individual item of data entered into a relational database is represented by a value in a column of a row in a table. Enterprise Architect's *UML Profile for Data Modeling* represents database tables as Classes with a stereotype of <<table>>. Columns are represented by Attributes with a stereotype of <<column>>. Tables and columns form the basis of Physical data models.

Enterprise Architect can generate simple DDL scripts to create the tables in your model. You can also perform Model Driven Architecture (MDA) Transformations to DDL - Enterprise Architect provides a template specifically for DDL transformations.

To help you map Class Attributes to Table fields, you can create connectors between specific attributes (features) in the Class element and the column Attributes in the Table element.

A simple example of a Physical data model in Enterprise Architect is shown below. The example consists of two tables represented by UML Classes, named *SalesPerson* and *Customer*. The table stereotype is denoted by the icon in the top-right corner of each Class. The tables each define three columns using UML Attributes typed appropriately for the target DBMS, which happens to be MySQL.

A simple Data model consisting of two tables, represented by UML Classes

So far, Primary Key and Foreign Key information modeling is not discussed; this is considered in later topics.

- [Primary and Foreign Keys](#)^[1357]

10.1.1.1 Create a Table

How To:

To add a Table to your data model, follow the steps below:

Step	Action	See Also
1	Open a diagram.	
2	Select the More tools Data Modeling menu option on the Toolbox.	

Step	Action	See Also
3	Click on the <i>Table</i> element in the list of elements, then click on the diagram. The Table element is displayed on the diagram.	
4	Use the Table Properties dialog to set the table name and other properties as required.	

Learn more:

- [Set the properties of a Table](#) ^[1348]

10.1.1.1.1 Working with Table Properties

Once you have created a table, you must set its properties to define database-specific information that can be used to generate the schema in DDL.

Most table properties, including the database type, are set using the Properties dialog. Some additional properties are defined using Tagged Values, such as the Table Owner and DBMS-specific options for MySQL and Oracle.

Once the table properties are defined, you are ready to add columns.

Topics:

Topic	Link
<p>Set the Database type for a table - other than the table name, the most important property to set for a table is the database type, which defines:</p> <ul style="list-style-type: none"> • The list of data types that are available for defining columns, and • Which dialect of DDL is generated 	Set the Database Type ^[1348]
<p>Set the Table Owner - Some relational databases enable you to assign a table to one of several <i>owners</i> within the database; Enterprise Architect enables you to model this using the <i>Owner</i> Tagged Value, so that in the generated DDL script the table name is prefixed by the owner name</p>	Set Table Owner/Schema ^[1349]
<p>Example MySQL options - To make use of foreign keys in MySQL, you must declare the table type as InnoDB</p>	Set MySQL Options ^[1349]
<p>Example Oracle options - To set additional Oracle table properties, use the table's Tagged Values</p>	Set Oracle Table Properties ^[1350]

Learn more:

- [Create Columns](#) ^[1351]

10.1.1.1.1.1 Set the Database Type

The most important property to set for a table (after its name) is the database type. This defines the list of data types that are available for defining columns, and also declares which dialect of DDL is generated.

Access: **Properties Dialog (Table element) > General page: Database**

How To:

Step	Action	See Also
1	Open the Property dialog for a Table element	
2	Locate the Database field on the General page	
3	Drop-down the list and select the required database type	
4	Save changes by clicking on the Apply or OK buttons	

10.1.1.1.1.2 Set Table Owner/Schema

Some relational databases enable you to assign a table to one of several schemas (or *owners*) within the same database. Enterprise Architect enables you to model this information using the *Owner* Tagged Value. By setting this optional value, you can tailor the generated DDL script, causing the table name to be prefixed by it's assigned owner name.

How To:

Step	Action	See Also
1	Add a Tagged Value named <i>Owner</i> , to the Table element	
2	Type the owner name for this table in the Value field of the Tagged Value Changes are automatically saved	

Notes:

- For a PostgreSQL database, you should instead create a Tagged Value named OWNER TO with the corresponding value

Learn More:

- [How to Add a Tagged Value](#)^[764]

10.1.1.1.1.3 Set MySQL Options

To make use of foreign keys in MySQL, you must declare the table type as InnoDB.

How To:

Step	Action	See Also
1	Add a Tagged Value named Type , to the table	
2	Set the Value field to InnoDB	

When you generate DDL for this table, the table type is included in the SQL script.

To allow for later versions of MySQL, additional table options that can be added in the same manner include:

Tag	Value (Example)
ENGINE	InnoDB
CHARACTER SET	latin1
CHARSET	latin1
COLLATE	latin1_german2_ci

Learn More

- [How to Add a Tagged Value](#)^[764]

10.1.1.1.4 Set Oracle Table Properties

To set additional Oracle table properties, you use the table's Tagged Values

How To:

Step	Action	See Also
1	Add one or more Tagged Values to the table, using the names provided in the Property/Tag column of the reference table below	
2	Specify the appropriate value for each tag Examples are provided in the Value column of the reference table below	

The same properties can be added to indexes and constraints, by highlighting the index or constraint Operation and adding the appropriate Tagged Values.

Reference:

Property/Tag	Value
BUFFER_POOL	DEFAULT
CACHE	NOCACHE
DBVERSION	9.0.111
FREELISTS	1
GRANT OWNER1	SELECT
GRANT OWNER2	DELETE, INSERT, SELECT, UPDATE
INITIAL	65536
INITRANS	1
LOGGING	LOGGING
MAXEXTENTS	2147483645
MAXTRANS	255

- [How to Add a Tagged Value](#)^[764]

10.1.1.2 Create Columns

Columns are represented in the UML Data Modeling Profile as a stereotyped attribute; that is, an attribute with the *Column* stereotype.

How To:

To create columns, follow the steps below:

Step	Action	See Also
1	Right-click on the required Table in a diagram, and select the Attributes context menu option The Attributes dialog displays, showing the columns of the selected Table	
2	In the Name field, type the column name	
3	In the Data Type field, click on the drop-down arrow and select the data type (ensure the Table's target database is set first; this populates the Data Type drop-down list) Click on the Save button	Set the Database Type ^[1348] Oracle Data Types ^[1354]
4	Complete the required optional fields, listed in the reference table below	
5	Click on the Column Properties button The Database Columns Properties dialog displays	
6	If you require a sequence, such as an Oracle sequence, select the AutoNum property, set the value to True and, if necessary, define the start number and increment Click on the OK button to return to the Attributes dialog	

Step	Action	See Also
7	Click on the Save button	
8	Click on the: <ul style="list-style-type: none"> • New button to define another column or • Close button to exit from the dialog 	

Reference:

Field	Description	See also
Primary Key	Indicates whether the column is the primary key for this table	
Not Null	Indicates whether empty values are forbidden for this column	
Unique	Indicates whether it is forbidden for any two values of this column to be identical The unique <i>stereotype</i> applied to an index ensures that no two <i>combinations</i> of values across a <i>set</i> of columns can be identical	
Initial	A value that can be used as a default value for this column, if required	
Access	Determines the column's scope (Private , Protected or Public) The default value is Public	
Alias	An alternative name for the field for display and documentation purposes	
Notes	Additional information necessary to document the column You can format the text using the Notes toolbar at the top of the field	

Notes:

- For MySQL, before creating columns you must first add ENUM and SET datatypes

Learn more:

- [Reorder Columns](#) ^[1352]
- [Data Types](#) ^[1353]
- [MySQL Data Types](#) ^[1354]
- [Options - Code Editors](#) ^[1519]

10.1.1.2.1 Reorder Columns

You can change the order in which columns are listed in a table, to define the order in which columns appear in the generated DDL that defines your database schema.

How To:

To change the column order, follow the steps below:

Step	Action	See Also
1	In the Columns dialog, highlight a column name in the Columns panel	
2	Click on the: <ul style="list-style-type: none">  button to move the column up one position  button to move the column down one position 	

10.1.2 Data Types

Each column that you define in your data model has a data type that is appropriate to the information being stored by that column. Data types vary from one DBMS product to another and also vary between versions of a given database product. Therefore Enterprise Architect provides you with tools to add new data types to your model repository and to convert data types between DBMS products.

Learn more:

- [Add New Datatype to Your Model Repository](#)^[1353]
- [Map Data Types between DBMS products](#)^[1355]

10.1.2.1 Add New Datatypes

Using Enterprise Architect's Database Datatypes screen, you can add to the set of data types that are available for a particular DBMS. This enables you to include any new datatypes that are supported by later versions of the DBMS and not yet included with Enterprise Architect.

You can also add an entire DBMS product and its built-in data types. This is helpful if you want to create a physical data model for a DBMS product that is not yet supported natively by Enterprise Architect.

Access: [Settings | Database Datatypes](#)

How To:

To add a new datatype to a DBMS product, follow the steps below:

Step	Action	See Also
1	Select the Database Datatypes menu option The Database Datatypes screen displays	
2	In the Product Name field click on the drop-down arrow and select an existing DBMS If your DBMS is not listed, you can click the Add Product button to add it	
3	In the Datatype field, type a name for the data type	
4	Select the appropriate Size radio button and, if appropriate, specify the default and maximum values	
5	In the Common Type field, click on the drop-down arrow and select a common type to which your data type applies	
6	Click on the Save button to create your data type	

You can transport these data types between models using Enterprise Architect's Reference Data

Learn more:

- [Add MySQL Data Types](#) ^[1354]
- [Customize Oracle Data Types](#) ^[1354]
- [Export Data Types as Reference Data](#) ^[237]
- [Import Data Types as Reference Data](#) ^[239]

10.1.2.1.1 MySQL Data Types

MySQL supports the **ENUM** and **SET** data types, which must be added to your Enterprise Architect model before you can use them as the types for columns.

Access: [Settings | Database Datatypes](#)

How To:

To add the ENUM and SET data types for MySQL, follow the steps below:

Step	Action	See Also
1	Select the Database Datatypes menu option The Database Datatypes dialog displays	
2	In the Product Name field select MySQL	
3	Add the data types ENUM and SET	

When using these data types later in a Column's **Initial** field, type the values as a comma-separated list, in the format:

('one','two','three')

If one value is the default, use the format:

('one','two','three') default 'three'

10.1.2.1.2 Oracle Data Types

The Oracle data types **NUMBER** and **VARCHAR** have additional properties that you can model.

Reference:

Data Type	Detail	See also
NUMBER	The NUMBER data type requires precision and scale properties The Precision and Scale fields are displayed on the Attributes dialog when the data type is set to NUMBER ; if you enter information into these fields, it is displayed on your diagrams For example: create NUMBER by setting Precision = 0 and Scale = 0	

Data Type	Detail	See also
	create NUMBER(8) by setting Precision = 8 and Scale = 0 create NUMBER(8,2) by setting Precision = 8 and Scale = 2	
VARCHAR	Oracle VARCHAR2(15 CHAR) and VARCHAR2(50 BYTE) data types can be created by adding the Tagged Value LengthType with the value CHAR or BYTE	

Learn more:

- [How to Add a Tagged Value](#)^[764]

10.1.2.2 Map Data Types between DBMS products

One of the advantages of using visual models to hide implementation details is that you can more easily change the target technology or platform when required. Enterprise Architect provides tools such as Datatype Mapping to help you do this for physical data models. For example, your project might involve migration from one DBMS platform to another.

After reverse engineering your database into a physical data model, you must remap the data types before generating the schema for the new DBMS product. Enterprise Architect provides a set of default mappings to help you automate the conversion process. However, you might want to customize the default mappings to suit your specific project requirements.

Access: [Settings | Database Datatypes: Datatype Map](#)

Use to:

- Streamline conversion of one implementation-specific database product to another
- Map data types from one DBMS product to another
- Maximize portability of your database designs
- Customize default mappings

How To:

To map data type sizes between databases, follow the steps below:

Step	Action	See Also
1	In the From Product Name field, click on the drop-down arrow and select the DBMS product to map data types from The Defined Datatypes for Databases panel displays all the defined data types for the product and, where appropriate, their sizes and values	
2	Click on the data type to map - this must have a defined size unit and value The Datatype and Common Type fields under the From Product Name field display this data type	
3	In the To Product Name field, click on the drop-down arrow and select the DBMS product to map data types to The Datatype and Common Type fields under this field display the corresponding values to those in the fields for the 'From' product	
4	In the Size panel, click on the radio button for the appropriate size unit and	

Step	Action	See Also
	type the default values in the corresponding data fields	
5	Click on the Save button to save the mapping.	

You can repeat this process for all the data types you want to map.

Once you are satisfied with the data type mappings, you can then convert either individual tables or an entire package of tables to the new target DBMS product.

10.1.2.2.1 Data Type Conversion Procedure

Once a database schema has been set up on an Enterprise Architect diagram (either by importing through ODBC or manually setting up the tables), the DBMS can be changed to another type and the column datatypes are mapped accordingly.

To map the DBMS type of a table to another DBMS type

How To:

Step	Action	See Also
1	Double-click on the Table element in a diagram The Table Properties dialog displays	
2	The Database field shows the current DBMS for this table.	
3	To map the column datatypes to another DBMS, select the target from the Database drop-down and click on the Apply button.	
4	The datatypes are converted to match those of the new DBMS, and these are reflected in any DDL generated from this table.	

10.1.2.2.2 Data Type Conversion for a Package

The DBMS Package procedure or mapper enables you to convert a package of database tables from one DBMS type to another DBMS type, as well as providing the ability to change the ownership of tables.

Access: [Project Browser Package Context Menu | Code Engineering | Reset DBMS Options > Manage DBMS Options](#)

How To:

To map the DBMS types of a package to another DBMS type, follow the steps below:

Step	Action	See Also
1	In the Current DBMS field, click on the drop-down arrow and select the current DBMS	
2	In the New DBMS field click on the drop-down arrow and select the target DBMS	
3	Select the Convert DBMS Type checkbox	

Step	Action	See Also
4	If there are child packages that also require changing, select the Process Child Packages checkbox	
5	Click on the OK button All tables in the selected packages are mapped to the new DBMS	

To change the owner of the table or all of the tables in a package, follow the steps below:

Step	Action	See Also
1	In the New Owner field, type the name of the new table owner	
2	In the Current Owner field, click on the drop-down arrow and select either: <ul style="list-style-type: none"> The current owner to change, or <All> to change the ownership of all tables in the package to the name you typed in the New Owner field 	
3	Select the Change Table Owner checkbox.	
4	If there are child packages that also require changing, select the Process Child Packages checkbox	
5	Click on the OK button The ownership changes for all Tables in the selected packages that have the specified current owner	

Learn More:

- [Set Table Owner](#) ^[1349]
- [Diagram Properties](#) ^[569]

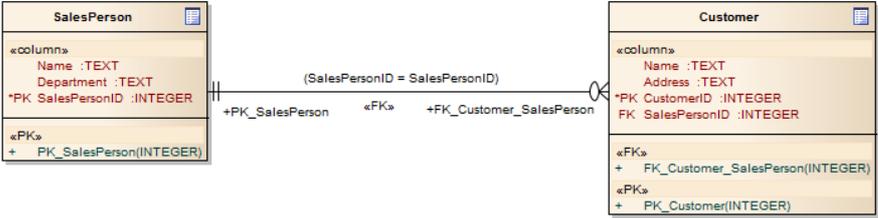

10.1.3 Database Keys

Two types of key are used to access tables in a relational database: *Primary Keys* and *Foreign Keys*.

- A Primary Key uniquely identifies a record in a table
- A Foreign Key accesses data in some other related table via its Primary Key

Topics:

Topic	Detail	See also
General Usage	In Enterprise Architect, Primary Keys and Foreign Keys are represented by stereotyped UML attributes and operations The following example shows a data model that includes both Primary Key and Foreign Key columns	

Topic	Detail	See also
Example	 <p>A Physical data model defined using a UML Profile that includes Primary and Foreign Keys</p>	
Primary Key	In each table, one of the columns is designated as the Primary Key, indicated by the <i>PK</i> label beside the column, and a corresponding Primary Key Operation	
Foreign Keys	Foreign Keys are shown denoted by the <i>FK</i> labels	
Association Notation	<p>The Association that defines a Foreign Key relationship between <i>SalesPerson</i> and <i>Customer</i> uses the Information Engineering notation; this is one of three notations that Enterprise Architect supports to help Data Modelers distinguish cardinality in relationships</p> <p>Enterprise Architect also supports:</p> <ul style="list-style-type: none"> • IDEF1X notation • UML notation 	

Learn more:

- [Primary Keys](#) ^[1358]
- [Foreign Keys](#) ^[1361]

10.1.3.1 Primary Key

A Primary Key uniquely identifies a record in a table and can consist of one or more columns.

Topics:

Topic	Detail	See also
Types of Primary Key	<p>In Enterprise Architect, a:</p> <ul style="list-style-type: none"> • Simple Primary Key (single column) is defined as the attribute of a stereotyped operation • Complex Primary Key (several columns) is defined as the stereotyped operation itself <p>For example, a column <i>LastName</i> might not be unique within a table, so a Primary Key is created from the <i>LastName</i>, <i>FirstName</i> and <i>DateOfBirth</i> columns</p>	

Learn more:

- [Create a Primary Key](#) ^[1359]
- [Define a Primary Key Name Template](#) ^[1359]
- [Foreign Keys](#) ^[1361]

10.1.3.1.1 Create a Primary Key

How To:

To define a simple Primary Key consisting of a single column, follow the steps below:

Step	Action	See Also
1	Right-click on the table in a diagram and select the Attributes context menu option The Attributes dialog displays	
2	Select the column that makes up the Primary Key	
3	Select the Primary Key checkbox and click on the Save button A stereotyped operation is automatically created; it is this operation that defines the Primary Key for the table To remove a Primary Key, simply delete this operation	

To define a complex Primary Key, consisting of more than one column, follow the steps below:

Step	Action	See Also
1	Follow the steps above to create a Simple Primary Key; it doesn't matter which column you choose	
2	Right-click on the table in a diagram and select the Operations context menu option The Operations dialog displays	
3	Select the Primary Key operation (its name begins with PK_) and then click on the Column tab	
4	Click on the New button to add a column to the Primary Key, select a column from the Column Name list box, and then click on the Save button	
5	Click on the Hand buttons (up and down arrow) to change the order of columns in the Primary Key, if necessary	

Learn more

- [Creating Non-Clustered Primary Keys for SQL Server](#)^[1360]

10.1.3.1.2 Define Primary Key Name Template

Enterprise Architect enables you to customize the way Primary Keys are named by default. This is helpful if you have specific modeling conventions that stipulate how Primary Keys are documented.

By changing the **Primary Key Name Template**, you adjust the name that Enterprise Architect assigns to the UML Operation that represents the Primary Key.

Access: **Tools | Options | Source Code Engineering | Code Editors: DDL Name Templates**

How To:

To define the name template for a Primary Key, follow the steps below:

Step	Action	See Also
1	Click on the DDL Name Templates button The DDL Name Template dialog displays, showing the default name templates	
2	Edit or replace the template in the Primary Key Name Template field For example, if you want to display the Primary Key description as <i>PK_tablename_columnname</i> then change the Primary Key Name Template field to <i>PK_%tablename%_%columnname%</i>	
3		
4	Click on the Save button	

10.1.3.1.3 SQL Server Non Clustered Keys

When you create a primary key in SQL Server, it is created with a 'clustered index' by default. Therefore when you model a primary key for SQL Server in an Enterprise Architect data model, the corresponding DDL creates a clustered index for that primary key by default.

Clustered indexes provide improved performance for accessing the column(s) involved, but only one clustered index is allowed per table.

In some situations, you might be more interested in the performance of columns other than the Primary Key, and therefore must change the default assignment of the clustered index. Enterprise Architect allows you to model this.

How To:

To define a Primary Key as non-clustered for a SQL Server table, follow the steps below:

Step	Action	See Also
1	Right-click on the table in a diagram and select the Operations context menu option The Table Operations dialog displays	
2	Highlight the Primary Key Operation and click on the Extended Properties button The Database Operation Properties dialog displays	
3	Select the SQL Server Non Clustered Primary Key checkbox	
4	Click on the Save & Close button	

Subsequently, you can model an index for that table and define it as clustered instead.

Learn more

- [Indexes](#)^[1366]

10.1.3.2 Foreign Key

A Foreign Key accesses data in some other related table via its Primary Key.

Topics:

Topic	Detail	See also
The nature of Foreign Keys	A Foreign Key consists of a collection of columns (UML Attributes) that together have some operational meaning (they enforce a relationship to the Primary Key in the other table)	
Modeling	Foreign keys are modeled in Enterprise Architect as operations with the stereotype FK The operation's parameters become the columns involved in the key	
Necessity of Use	It is not necessary to define a Foreign Key just to access another table through its Primary Key Foreign Keys are a feature of some database management systems, providing 'extras' such as referential integrity checking that prevents the deletion of a record if its Primary Key value exists in some other table's Foreign Key The same thing can be achieved programmatically	

Learn more

- [Create a Foreign Key](#)^[1367]
- [Composite Foreign Key](#)^[1364]
- [Define a Foreign Key Name Template](#)^[1365]

10.1.3.2.1 Create a Foreign KeyHow To:

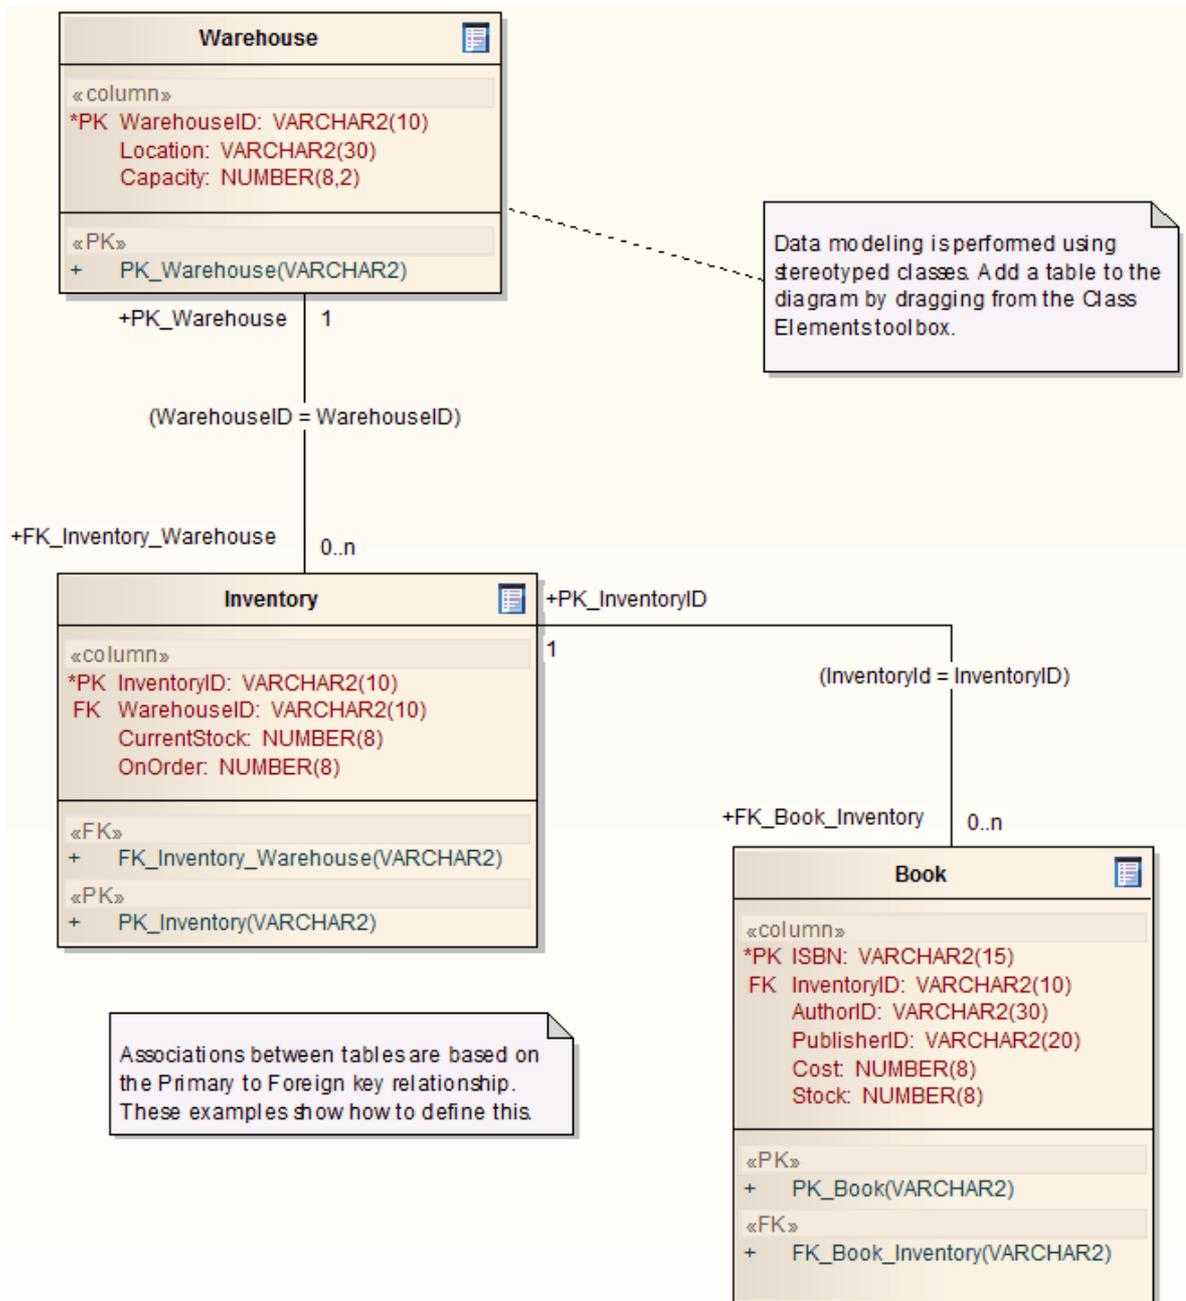

To create a Foreign Key, follow the steps below:

Step	Action	See Also
1	Locate the required Tables in a diagram Both tables must have defined database types	Set The Database Type ^[1348]
2	Select an <i>Associate</i> connector in the Class Relationships page of the Toolbox	
3	Click on the Table to contain the Foreign Key (source) and draw the connector to the other Table (target)	
4	Right-click on the connector and select the Foreign Keys context menu option The Foreign Key Constraint dialog displays	

Step	Action	See Also
5	The default foreign key name is set by the Foreign Key Name Template To change the name to something other than the default provided by the template, select the Override Template checkbox and edit the foreign key name	Define Foreign Key Name Template <small>1365</small>
6	In the Source: panel and the Target: panel, click on the name of each of the two columns involved in the Foreign Key relationship	
7	From the On Delete and/or On Update combo boxes, select the appropriate referential integrity constraint	
8	Click on the Apply or OK buttons to automatically generate the Foreign Key operations	

Example:

The example below shows how a Foreign Key looks in a diagram:

**Notes:**

- For MySQL databases, Foreign Keys are supported for InnoDB tables only.

InnoDB is the default MySQL storage engine as of version 5.5; if you are modeling a MySQL database that is earlier than version 5.5 and you want to use Foreign Keys, you must ensure the **Engine** Tagged Value is set to **InnoDB**

Learn More:

- [Set MySQL Options](#) ^[1349]

10.1.3.2.2 Composite Foreign Key

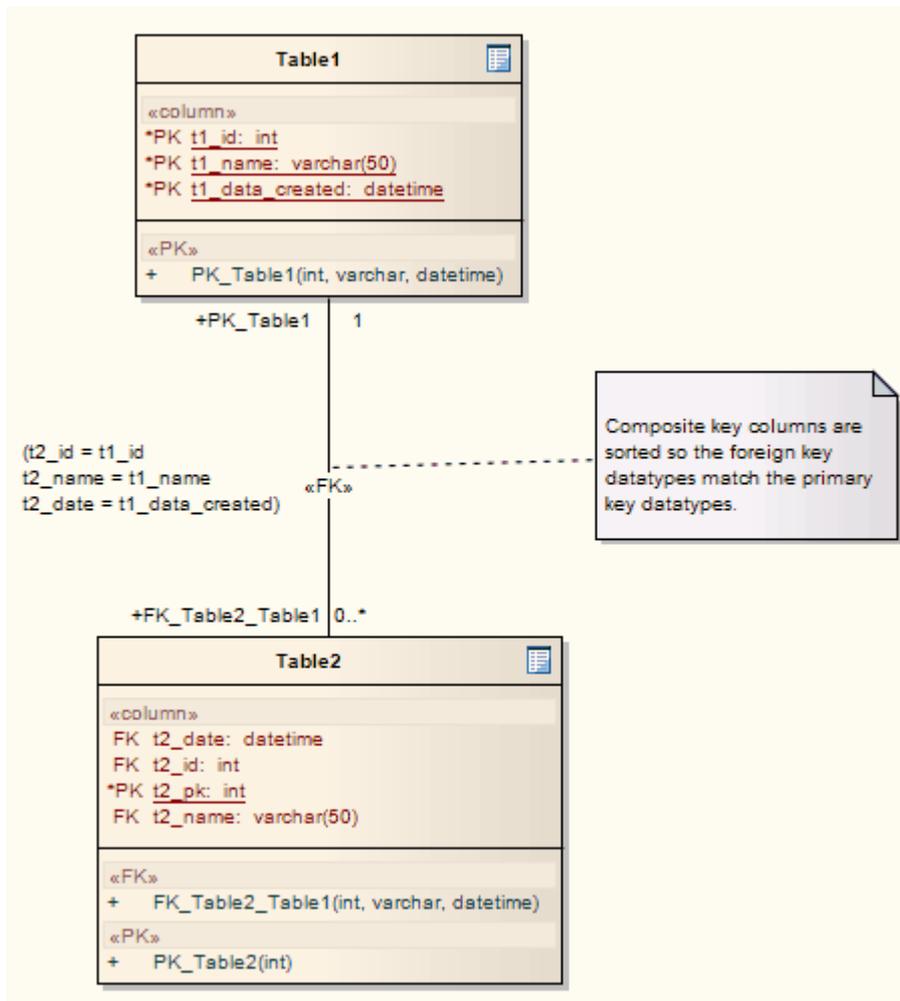

How To:

To create a composite Foreign Key, follow the steps below:

Step	Action	See Also
1	Locate the required Tables in a diagram Both tables must have defined database types	Set The Database Type ^[1348]
2	Select an <i>Associate</i> connector in the Class Relationships page of the Toolbox	
3	Click on the Table to contain the Foreign Key (source) and draw the connector to the other Table (target)	
4	Right-click on the connector and select the Foreign Keys context menu option The Foreign Key Constraint dialog displays	
5	The default foreign key name is set by the Foreign Key Name Template To change the name to something other than the default provided by the template, select the Override Template checkbox and edit the foreign key name	Define Foreign Key Name Template ^[1365]
6	In the Source: panel and the Target: panel, click on the names of the required columns in each panel	
7	Click on the OK button The Foreign Key columns are sorted according to data type to match the data types of the targeted composite Primary Key	
8	If required, you can change the order of the key columns by clicking on the  and  buttons	

Example:

The example below shows how a Composite Foreign Key looks in a diagram:

10.1.3.2.3 Define Foreign Key Name Template

Enterprise Architect enables you to customize the way Foreign Key relationships are named by default. This is helpful if you have specific modeling conventions that stipulate how Foreign Keys are documented.

By changing the **Foreign Key Name Template**, you adjust the name that Enterprise Architect assigns to the Association connector and the Operation that define the Foreign Key relationship.

Access: [Tools | Options | Source Code Engineering | Code Editors: DDL Name Template](#)

How To:

To define the name template for a Foreign Key, follow the steps below:

Step	Action	See Also
1	Select the Code Editors menu option The Code Editors page of the Options dialog displays	
2	Click on the DDL Name Template button	

Step	Action	See Also
	The DDL Name Template dialog displays, showing the default name templates	
3	<p>Edit or replace the name template in the Foreign Key Name Template field</p> <p>For example, if you want to display the Foreign Key description as</p> <p><i>FK_foreigntablename_FKcolumnname_primarytablename_PKcolumnname</i></p> <p>then change the Foreign Key Name Template field to</p> <p><i>FK_%foreigntablename%_%fkcolumnname%_%primarytablename%_%pkcolumnname%.</i></p>	
4	Click on the Save button.	

10.1.4 Stored Procedures

Topics:

Topic	Detail	See also
What is a Stored Procedure?	<p>A stored procedure is a group of SQL statements that form a logical unit and perform a particular task. Stored procedures are used to encapsulate a set of operations or queries to execute on a database server. You can compile and execute stored procedures with different parameters and results, and they can have any combination of input, output and input/output parameters.</p> <p>Enterprise Architect models stored procedures using stereotyped UML Classes and Operations.</p>	

Learn more

- [Create a Stored Procedure](#)^[1367]

10.1.5 Indexes

Topics:

Topic	Detail	See also
What is an Index?	<p>An index is a sorted look-up for a table. When it is known in advance that a table must be sorted in a specific order, it is usually worth the small processing overhead to always maintain a sorted look-up list rather than sort the table every time it is required. In Enterprise Architect, an index is modeled as a stereotyped operation. On generating DDL, the necessary instructions for generating indexes are written to the DDL output.</p>	

Learn more

- [Create an Index](#)^[1367]

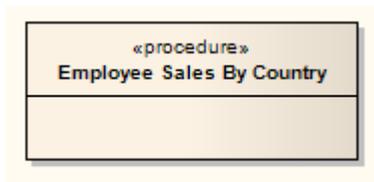

10.1.5.1 Create a Stored Procedure

How To:

To create a stored procedure as a UML Class, follow the steps below.

Step	Action	See Also
1	Open the required diagram.	
2	From the Data Modeling page of the Toolbox (More tools Data Modeling) drag the Procedure icon onto the diagram.	
3	If the Properties dialog does not automatically display, double-click on the element.	
4	In the Database field click on the drop-down arrow and select the target DBMS to model The field displays the default database if it has already been set	
5	In the Procedure definition field, type the entire procedure text.	
6	Click on the OK button.	
7	To rename the stored procedure, select the element, press (F2) and type the new name.	

Example:

10.1.5.2 Create an Index

How To:

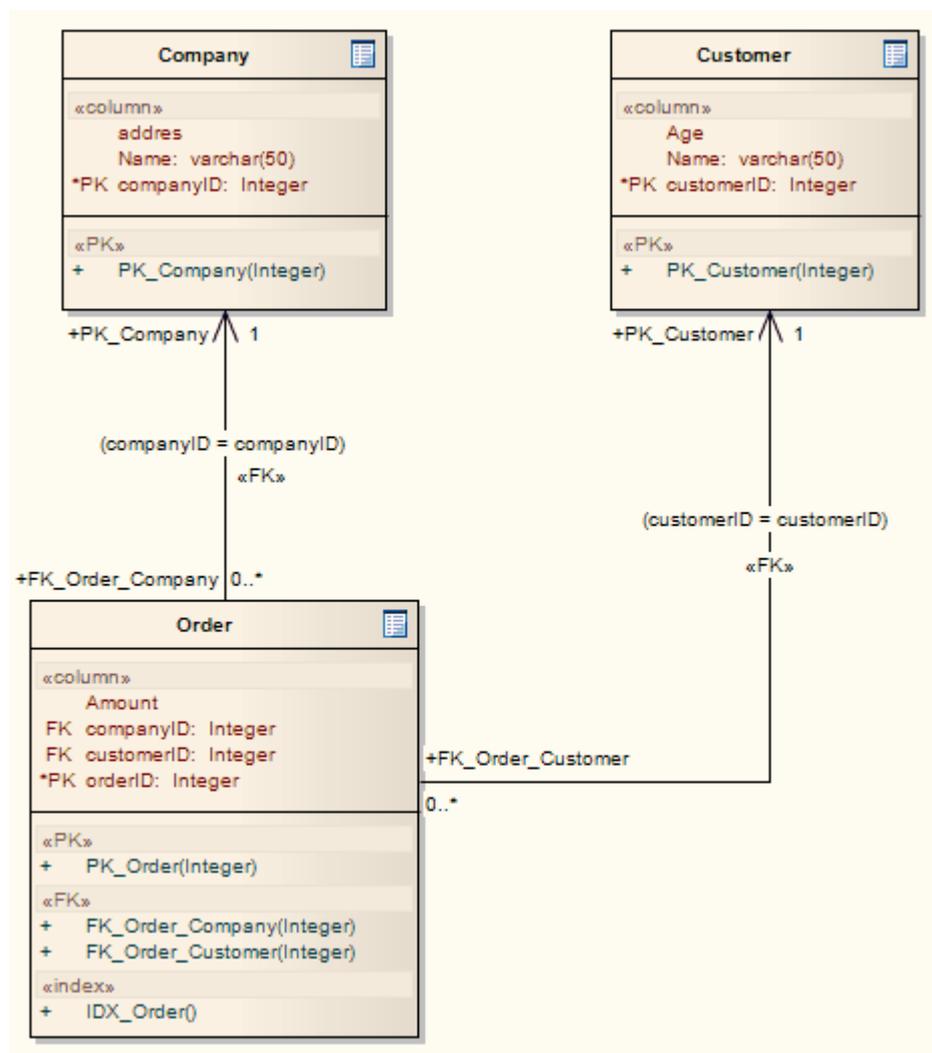

To create an Index, follow the steps below:

Step	Action	See Also
1	Ensure that the column(s) to be used in the index have already been defined in the table.	
2	Right-click on the required table either in a diagram or in the Project Browser .	
3	Select the Operations context menu option The Operations dialog displays.	
4	Add an operation with a name such as <i>IDX_CustomerID</i> . The <i>IDX_</i> prefix is optional, but helps to identify the operation.	

Step	Action	See Also
5	In the Stereotype field for the operation, select index (check and unique are also supported).	
6	Click on the Column tab.	
7	Select the required columns from the Columns drop-down list in the required order	
8	Click the Save button to save changes.	

Example:

In the example below, the *Order* element shows how an index looks in a diagram:

Notes:

- The **unique** characteristic applied to a single column ensures that no two data values in the column can be identical. The **unique** stereotype applied to an index ensures that no two combinations of values across a set of columns can be identical

Learn more:

- [Define Columns](#)^[1357]

10.1.6 Triggers

Topics:

Topic	Detail	See also
What is a Trigger?	A trigger is an operation automatically executed as a result of the modification of data in the database, and usually ensures consistent behavior of the database. For example, a trigger might be used to define validations that must be performed every time a value is modified, or might perform deletions in a secondary table when a record in the primary table is deleted. In Enterprise Architect, a trigger is modeled as a stereotyped operation.	

Learn more

- [Create a Trigger](#)^[1369]

10.1.6.1 Create a Trigger

How To:

To create a Trigger, follow the steps below

Step	Action	See Also
1	Locate the required table in either a diagram or the Project Browser	
2	Use the context menu to open the Operations dialog	
3	Add an operation with a name such as <i>TRG_OnCustomerUpdate</i> The <i>TRG_</i> prefix is optional, but helps to identify the operation	
4	In the Stereotype field select trigger	
5	Click the Save button	
6	Select the trigger operation, then the Behavior tab	
7	In the Initial Code field, enter the entire trigger code including the <i>CREATE_TRIGGER</i> statement	
8	Click the Save button	

10.1.7 Check Constraints

Topics:

Topic	Detail	See also
What is a Check Constraint?	A <i>Check Constraint</i> enforces domain integrity by limiting the values that are accepted by a column.	

Learn more:

- [Create a Check Constraint](#)^[1370]

10.1.7.1 Create a Check Constraint

How To:

To create a Constraint, follow the steps below:

Step	Action	See Also
1	Locate the required table in either a diagram or the Project Browser	
2	Use the context menu to open the Operations dialog	
3	Add an operation with a name such as <i>CHK_ColumnName</i> The <i>CHK_</i> prefix is optional, but helps to identify the operation	
4	In the Stereotype field select check	
5	Click the Save button	
6	Select the check constraint operation, then the Behavior tab	
7	In the Initial Code field, enter the entire check constraint clause (for example, col1 < 1000)	
8	Click on the Save button	

10.1.8 Views

Topics:

Topic	Detail	See also
What is a Database View?	A Database View defines a subset of the database, aggregated into a dynamic, 'virtual' table'. The information presented by a Database View is not physically replicated, rather it is automatically derived based on the query that defines the view. Enterprise Architect models Database Views as stereotyped UML Classes.	

Learn more

- [Create a View](#)^[1371]

10.1.8.1 Create a View

How To:

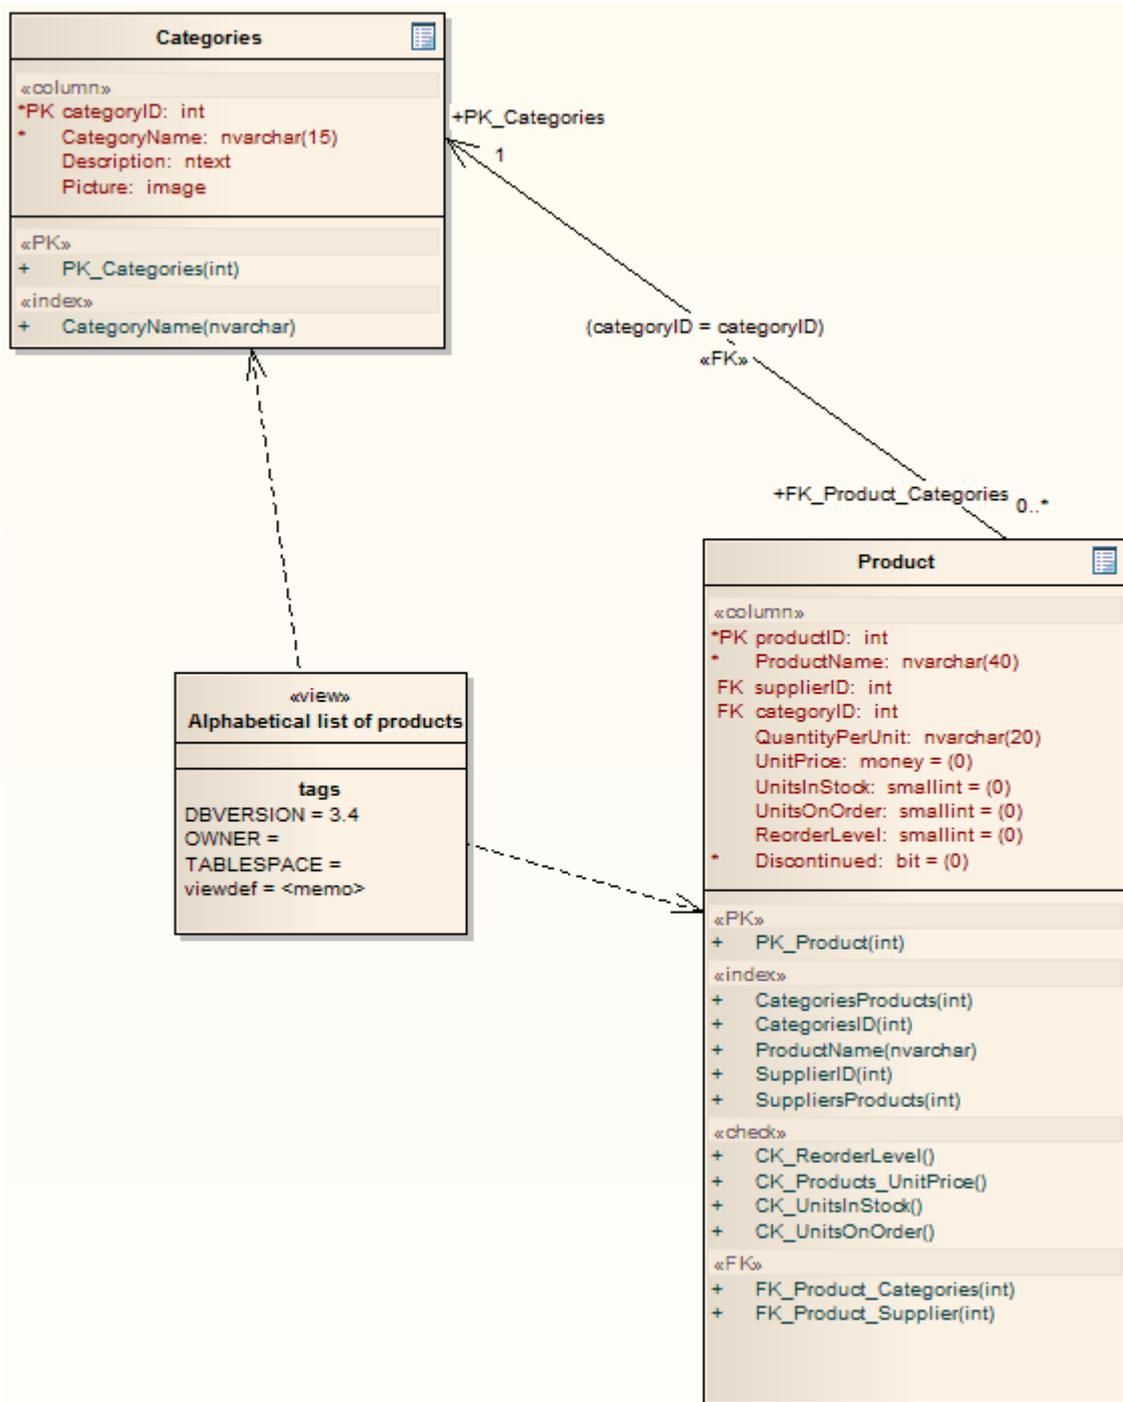

To create a database View, follow the steps below:

Step	Action	See Also
1	On the Data Modeling page of the Toolbox (More tools Data Modeling) , drag the View icon onto your Data Modeling diagram	
2	If the View Properties dialog does not immediately display, double-click on the element	
3	From the Database drop-down list, select the target DBMS to model. The default database displays if it has already been set	
4	Click on the OK button	
5	To rename the View, select the element, press (F2) and type the new name	

To create the View definition, follow the steps below

Step	Action	See Also
1	Create a Dependency connector from the View to the table or tables on which the View depends	
2	Double-click on the View to display the Properties dialog The tables are now listed in the Dependencies field	
3	In the View definition field , type the full view definition The code editor provides intellisense for basic SQL keywords and functions	Code Editor ^[1394]
4	Click on the OK button to save your definition	

Example:

**Notes:**

- The View definition and certain other parameters are held as Tagged Values. The View definition is held in the *viewdef* memo Tagged Value, as shown in the following example diagram. You can select and view the *viewdef* Tagged Value in the **Tagged Values** window, and include it in RTF reports by inserting the **valueOf(viewdef)** field in the *Package::Element* or *Element::Tagged Values* sections

Learn More:

- [Tagged Values](#) ⁷⁶²

- [valueOf\(viewdef\)](#)^[1743]

10.1.9 Oracle Packages

How To:

To create an Oracle package, follow the steps below:

Step	Action	See Also
1	Add a Class element to your data model.	
2	Open the Properties dialog for the element and, in the Stereotype field, type the value Package .	
3	For the package specification, create an Operation with the name <i>Specification</i> and with no return type.	
4	Open the Properties dialog for the <i>Specification Operation</i> and, on the Behavior tab, type the entire package specification into the Initial Code field.	
5	For the package body, create an Operation with the name <i>Body</i> and with no return type.	
6	Open the Properties dialog for the <i>Body Operation</i> and, on the Behavior tab, type the entire package body into the Initial Code field.	

Learn more

- [How to Use the Initial Code Field](#)^[711]

10.1.10 Default Constraints

Default Constraints only apply to SQL Server, and are supported to maintain compatibility with earlier versions.

Access: **Table context menu | Operations**

Use to:

- Create a default constraint

How to:

To create a Default Constraint using the Operations Properties dialog, follow the steps below:

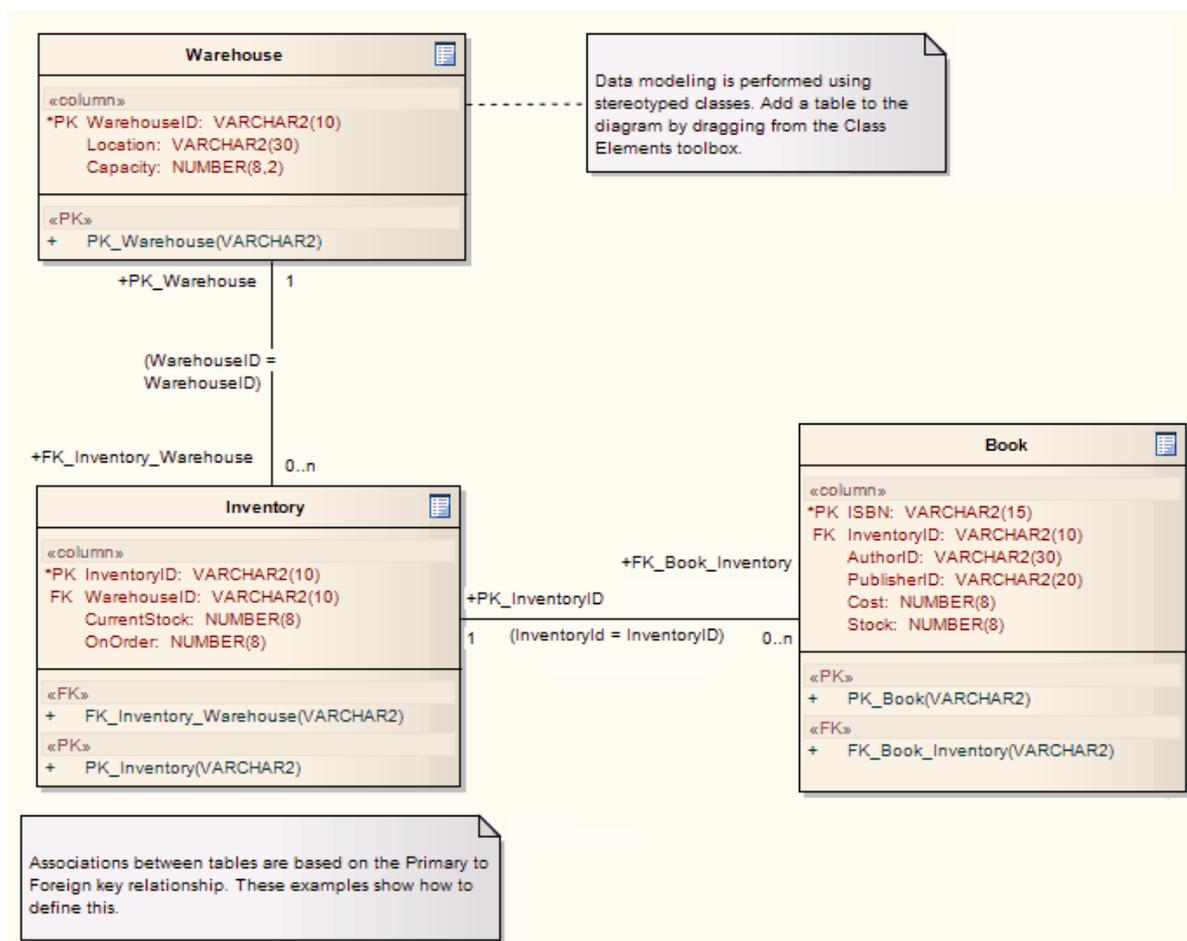

Step	Action
1	In the Name field, type the new operation name DF_<ColumnName> The DF_ is optional, but helps to identify the operation
2	In the Stereotype field type or select the value default
3	Click on the Save button

Step	Action
4	In the Operations list, click on the default operation name, then click Column in the left panel
5	Select the appropriate column from the Column Name drop down list
6	Click on Behavior in the left-hand panel
7	In the Initial Code field, type the default value
8	Click on the Save button

10.1.11 A Data Model Diagram

An example of a *Data Model* diagram is provided below, showing three tables that are linked on *primary to foreign* key pairs with associated multiplicity.

Example:

10.2 Import Database Schema

Analysis of legacy database systems is possible using Enterprise Architect's reverse engineering capabilities. By connecting to a live database via ODBC, you can import the database schema into a standard UML model. Subsequent imports enable you to maintain synchronization between the data model and the live database.

Enterprise Architect supports importing database tables from an ODBC data source. Tables are imported as stereotyped Classes with suitable data definitions for the source DBMS.

How To:

To import database schema and objects, follow the steps below

Step	Action	See Also
1	Select any package in the Logical View	
2	<p>To import into:</p> <ul style="list-style-type: none"> The package only, right-click on the package to display the context menu, and select the Code Engineering Import DB Schema from ODBC menu option A diagram, right-click on the diagram in the selected package to open the context menu, and select the Import DB schema from ODBC menu option <p>The Import DB Schema from ODBC Source dialog displays</p>	
3	<p>In the Database field, click on the (...) (Browse) button and select a suitable ODBC data source from the ODBC dialog (ODBC must be installed and configured on your machine for this to work correctly)</p> <p>When you have selected the data source, the Database field shows the DBMS, the database server ID and the database name, separated by full stops; that is:</p> <p><i>dbms.dbserver.database.</i></p>	Select a Suitable Data Source ^[1377]
4	<p>You can filter objects to be retrieved from the database by schema or owner</p> <p>In the Schema/Owner field, type the schema/owner as a single entry, or as a comma-separated list</p> <p>The filter is useful for databases that support multiple schemas or owners, such as SQL Server 2005/2008, Oracle, PostgreSQL and DB2 Express</p> <p>By default, when importing database objects from Oracle, Enterprise Architect inserts the Oracle user name in this field to avoid unnecessary retrieval of large numbers of objects not owned by that user</p>	
5	<p>In the Filter panel, select the appropriate checkboxes for additional items to include in the import</p> <p>Select the appropriate checkboxes to import system tables and views, user views, triggers and/or Oracle packages</p> <p>If you select to import User Functions and/or User Sequences as individual Classes, then they are imported as separate elements and the Properties dialog is solely concerned with the Function or Sequence definition; for Stored Procedures, always select this option</p>	

Step	Action	See Also
	If you select to import User Functions and/or User Sequences as Class operations, then they are imported as operations (methods) and you view and edit them through the Operations Properties dialog of the parent Class	
6	In the Synchronization panel, select the appropriate option to determine whether the existing Classes are to be synchronized, or the database objects imported as new objects If you select the Synchronize existing classes option, also select the appropriate checkboxes to determine whether model comments, column default values and/or table constraints are to be retained or overwritten with the comments, values and constraints of the imported objects	
7	Click on the Import button to start the import	
8	Select the database objects to import	Select Tables ^[1377] Imported Class Elements ^[1377]

Notes:

- Import of stored procedures and views is supported for: DB2; SQL Server; Firebird/Interbase; Informix; Ingres; Oracle 9i, 10g and 11g; MySQL; SQLite, PostgreSQL; Sybase Adaptive Server Enterprise (ASE) and Sybase Adaptive Server Anywhere (ASA)
- If you are importing database schema from an MS Access Jet 4.0 database, please ensure that you have selected the **Use Jet 4.0** checkbox on the General page of the Options dialog, otherwise the Jet 3.5 routines are loaded; you must restart Enterprise Architect after selecting the checkbox
- Enterprise Architect requires **32-bit ODBC** drivers to connect to a repository through ODBC; to set up the ODBC configuration on **64-bit** clients, run the 32-bit ODBC Data Source Administrator from C: \Windows\SysWOW64\odbcad32.exe
- The ODBC connection should use the ODBC driver available from the DBMS vendor, such as MySQL's ODBC driver for MySQL, and Oracle's ODBC driver for Oracle; drivers provided by third-party vendors are not supported, including the Microsoft ODBC driver for Oracle
- If setting up a ODBC connection for reverse engineering, the default settings are sufficient
- Additional data types are available from the Datamodeling Data Types section of the Resources page on the Sparx Systems website
- For importation, you can select the **Tools | Database Engineering | Import DB Schema from ODBC** menu option as an alternative
- It is only possible to import into a diagram if it is in the selected package - if a diagram from another package is open, a message displays to give the option to cancel the import or to continue importing into the package only; the Import DB Schema from ODBC Source dialog includes checkbox options to import into the diagram and package, or into the package only
- If no diagram is open, the **Package Only** radio button defaults to selected and the options are disabled; if the open diagram is in the selected package, you can select either option

10.2.1 Select a Data Source

Topics:

Topic	Detail	See also
General Usage	<p>To import DDL from existing data sources, you must have a suitable ODBC connection installed and configured</p> <p>From the Import DB Schema from ODBC Source dialog you can select the ODBC data source using the standard windows ODBC set-up dialog; click on the data source name and then click on the OK button</p>	

Learn More:

- [Connect to a Data Repository](#)^[16]

10.2.2 Select Tables

When you have opened the ODBC data source, Enterprise Architect acquires a list of database objects suitable for importing. This is presented in a list form for you to select from.

Highlight the schema to import from the top list. Alternatively, select individual objects from the lower list.

Topics:

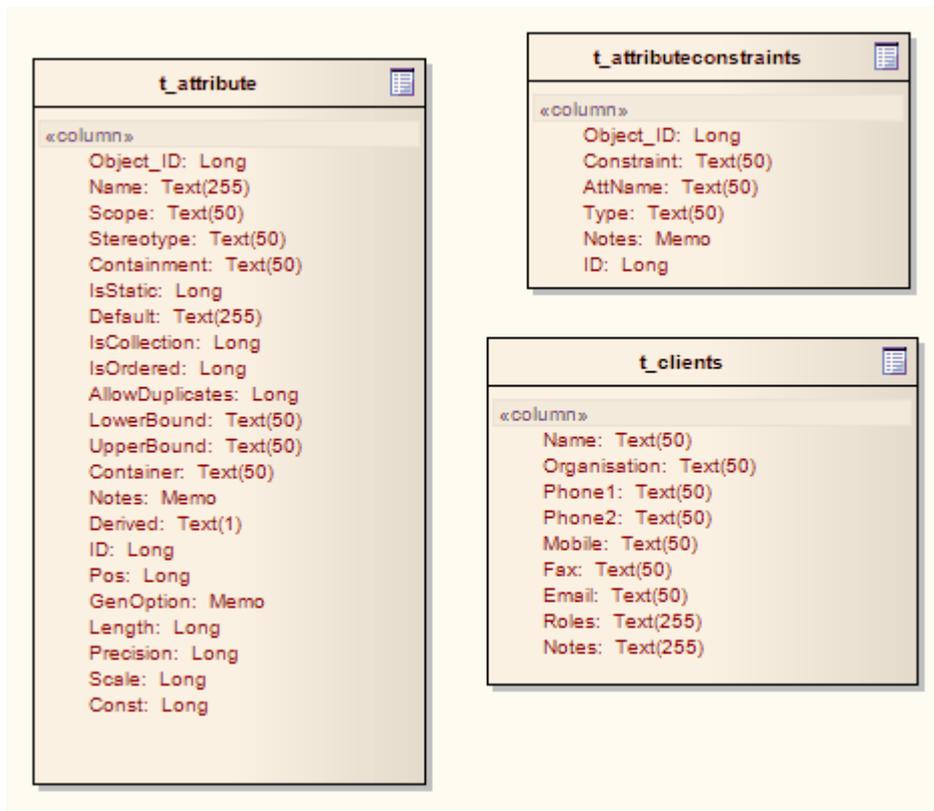

Topic	Detail	See also
Selection Shortcuts	<ul style="list-style-type: none"> • To select all objects, click on the Select All button • To clear all objects, click on the Select None button • Hold down (Ctrl) while clicking to select multiple objects • Hold down (Shift) and click on the first and last objects in a range to select that range <p>When you have selected the objects, click on the OK button</p>	

10.2.3 The Imported Class Elements

When you import DDL table definitions they are converted to stereotyped Classes according the *UML Data Modeling Profile*.

The image below shows some example tables imported into the model using an ODBC data connection.

Example:

10.3 Generate DDL

Enterprise Architect enables you to generate DDL from your model for Tables and Packages.

Learn More:

- [Generate DDL for Tables](#) ^[1379]
- [Generate DDL for Packages](#) ^[1380]

10.3.1 Generate DDL For a Table

How To:

To generate DDL for a table, follow the steps below:

Step	Action	See Also
1	In the diagram, right-click on the table for which to generate DDL The context menu displays	
2	Select the Generate DDL option The Generate DDL dialog displays	
3	In the Path field, use the (...) (Browse) button to select the filename of the script to create	
4	To include comments in the DDL, in the Comment Level field select the appropriate level For example, Column for comments on columns, or All for comments on all structures	
5	Select the checkboxes for the appropriate inclusions; for example, to include a 'drop table' command in the script, select the Create Drop SQL checkbox Deselect the checkboxes for inclusions you do not require	
6	To create the DDL, click on the Generate button	
7	To view the output, click on the View button (you must configure a DDL viewer in the Local Settings dialog first)	

Notes:

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Generate Source Code and DDL** permission to generate DDL
- Some checkboxes display only if the appropriate database is defined for the table; for example, **IF EXISTS** displays only if the database for the table is PostgreSQL, and **SEQ_** and **_SEQ** radio buttons display only if the database for the table is Oracle
- For a PostgreSQL database, you must select the **Generate Sequences** checkbox to enable auto increment columns to be created
- If generating Oracle sequences, you must always select the **Generate Triggers** and **Generate Sequences** checkboxes - this ensures that a pre-insert trigger is generated to select the next sequence value to populate the column; also set the **AutoNum** property to **True** in the column properties
- If generating Oracle sequences, to generate the sequence name and trigger name with the syntax

SEQ_<sequence_name> and *TRG_<trigger_name>*, select the **SEQ_** option; conversely, to generate them with the syntax *<sequence_name>_SEQ* and *SET_<trigger_name>*, select the **_SEQ** option

Learn More:

- [Permission List](#)^[205]
- [Create Columns](#)^[135]

10.3.2 Generate DDL for a Package

In this procedure, you can generate DDL for a package, and also compare the DDL with the database.

Access: **Project Browser package context menu | Code Engineering | Generate DDL**
Select package Tools | Database Engineering | Generate Package DDL

How To:

To generate DDL for a package, follow the steps below:

Step	Action	See Also
1	Select the menu option The Generate Package DDL dialog displays	
2	Select the checkbox against each inclusion required Deselect the checkboxes for inclusions you do not require	
3	To recursively generate DDL, select the Include All Child Packages checkbox	
4	Select the Save Generated Order checkbox to save the order in which the objects are generated This is useful where the order is changed to resolve object dependencies; the order is saved when you click on the Generate button	
5	If you click the Refresh button with the Save Generated Order checkbox <i>unchecked</i> , the objects are restored to their original order	
6	Click on the Generate button to proceed Enterprise Architect prompts you for file names as the process executes	

To compare the generated DDL with the database, follow the steps below

Step	Action	See Also
1	On the Generate Package DDL dialog, click on the Compare button The Compare With Database dialog displays	
2	Click on the (...) button and locate the required database on the Select Data Source dialog	
3	For an Oracle database, if required you can also specify the Owner in the Schema/Owner field	

Step	Action	See Also
4	Click on the View button to perform the comparison The Comparison Database dialog displays with the results of the comparison Click on each table name to review information on that table	

Notes:

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Generate Source Code and DDL** permission to generate DDL
- Some checkboxes display only if the appropriate database is defined for the table. For example, **IF EXISTS** displays only if the database for the table is PostgreSQL, and **SEQ_** and **_SEQ** radio buttons display only if the database for the table is Oracle
- For a PostgreSQL database, you must select the **Generate Sequences** checkbox to enable auto increment columns to be created
- If generating Oracle sequences, you must always select the **Generate Triggers** and **Generate Sequences** checkboxes - this ensures that a pre-insert trigger is generated to select the next sequence value to populate the column; also set the **AutoNum** property to **True** in the column properties
- If generating Oracle sequences, to generate the sequence name and trigger name with the syntax *SEQ_<sequence_name>* and *TRG_<trigger_name>*, select the **SEQ_** option; conversely, to generate them with the syntax *<sequence_name>_SEQ* and *SET_<trigger_name>*, select the **_SEQ** option

10.4 Entity Relationship Diagrams (ERDs)

According to the online [Wikipedia](#):

An entity-relationship model (ERM) is an abstract and conceptual representation of data. Entity-relationship modeling is a database modeling method, used to produce a type of conceptual schema or semantic data model of a system, often a relational database, and its requirements in a top-down fashion. Diagrams created by this process are called Entity-Relationship Diagrams, ER Diagrams, or ERDs.

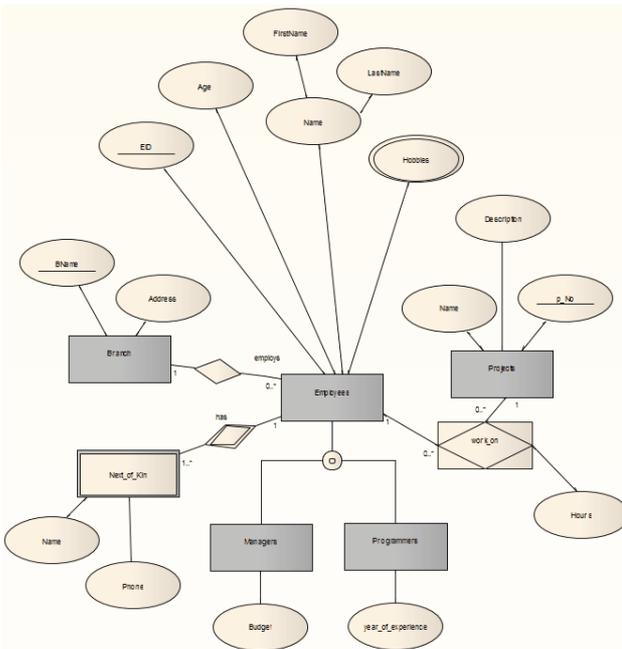

Entity Relationship Diagrams in Enterprise Architect:

Entity Relationship Diagrams in Enterprise Architect are based on Chen's ERD building blocks: entities are represented as rectangles, attributes are represented as ellipses and relationships are represented as diamond-shape connectors.

ERD technology in Enterprise Architect assists you in every stage from building conceptual data models to generating Data Definition Language (DDL) for the target DBMS.

Topics:

Topic	Detail	See also
MDG Technology for ERD and ERD Transformations	<p>Enterprise Architect enables you to develop Entity Relationship diagrams quickly and simply, through use of an MDG Technology integrated with the Enterprise Architect installer. The Entity Relationship diagram facilities are provided in the form of:</p> <ul style="list-style-type: none"> • An Entity Relationship diagram type, accessed through the New Diagram dialog • An Entity Relationship Diagram page in the Toolbox • Entity Relationship element and relationship entries in the Toolbox Shortcut Menu and Quick Linker <p>Enterprise Architect also provides transformation templates to transform Entity Relationship Diagrams into Data Modeling Diagrams, and vice versa.</p>	<p>New Diagram Dialog^[568]</p> <p>Toolbox Shortcut^[557]</p> <p>Quick Linker^[622]</p> <p>ERD to Data Model Transformation^[1317]</p> <p>Data Model to ERD Transformation^[1310]</p>
Entity Relationship Diagram Toolbox Page 	<p>You can access the Entity Relationship Diagram page of the Toolbox through the More tools Entity Relationship Diagrams menu option.</p> <ul style="list-style-type: none"> • Entity is an object or concept that is uniquely identifiable. The property of Multiplicity in the SourceRole and TargetRole definitions for the Relationship connector (below) can be used to define the cardinality of an Entity that participates in this relationship. • Attribute is a property of an entity or a relationship type • N-ary Association represents unary (many-to-many recursive) or ternary relationships and can also be used to represent relationships that have attributes among the entities; Note that the N-ary Association element should always be at the target end of a connector • Connector is a connector between an Entity and an 	

Topic	Detail	See also
	<p>Attribute, and between two Attributes</p> <ul style="list-style-type: none"> Relationship is a diamond-shape connector, representing the meaningful association among entities. Disjoint and Overlapping represent the relationships between the super-class Entity and the sub-class Entity 	
<p>A typical Entity Relationship Diagram</p>	 <p>The diagram illustrates a central 'Employee' entity with attributes: ED (underlined), Age, Name (with sub-attributes FirstName and LastName), and Hobbies. It is connected to several other entities: <ul style="list-style-type: none"> 'Branch' (1 to 1) via an 'employs' relationship (diamond connector). 'Project' (0..1 to 1) via a 'works_on' relationship (diamond connector). 'Managers' (1 to 1) via a 'has' relationship (diamond connector). 'Programmers' (1 to 1) via a 'has' relationship (diamond connector). 'Next_of_Kin' (1..1 to 1) via a 'has' relationship (diamond connector). Other entities and their attributes: <ul style="list-style-type: none"> 'Branch': Name (underlined), Address. 'Project': Name, D_No (underlined), Description. 'Managers': Budget. 'Programmers': year_of_experience. 'Next_of_Kin': Name, Phone. 'works_on' relationship: Hours. </p>	
<p>Disable Entity Relationship Diagrams</p>	<p>If you prefer not to use Entity Relationship Diagrams in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (Settings MDG Technologies).</p>	<p>MDG Technologies 1033</p>

Tagged Values:

Some of the Entity Relationship diagram components can be modified by Tagged Values, as indicated below:

Component	Tagged Value	Notes
Entity	isWeakEntity	If true, this entity is a weak entity.
Attribute	attributeType	Four options: <ul style="list-style-type: none"> normal Attribute primary key attribute multi-valued Attribute derived Attribute
	commonData	Defines the common data type for each attribute.

Component	Tagged Value	Notes
	taType	
	dbmsDataType	<p>Defines the customized DBMS data type for each attribute.</p> <p>You must define the customized type first through the Settings Database Datatypes menu option</p> <p>Also, set the <i>commonDataType</i> tag to na to activate the <i>dbmsDataType</i> tag.</p>
N-ary Association	isRecursive	<p>If true, the N-ary Association represents the many-to-many recursive relationship.</p> <p>For one-to-many and one-to-one recursive relationships, we suggest using the normal Relationship connector.</p> <p>Sometimes you might want to limit the stretch of the diamond-shape Relationship connectors. Simply pick a Relationship connector, right-click to display the context menu, and select the Bend Line at Cursor option.</p>
Relationship	isWeak	If true, the Relationship is a weak relationship.
Disjoin Overlapping	Participation	Two options: partial and total.

Notes:

- Entity Relationship Diagrams are supported in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect

Part

11 Software Engineering

Software Engineering is the process of designing, implementing and maintaining software. This section describes how Enterprise Architect can assist in this process by providing a design environment and tools including **automated code generation**, **reverse engineering** of source code and **synchronization** between the source code and model.

11.2.1 Getting Started

To quickly start development in the Model Driven Development Environment, check through the following topics:

- [Prerequisites](#) ^[1391]
- [Available Tools](#) ^[1391]
- [Workspace Layouts](#) ^[1391]
- [General Workflow](#) ^[1391]
- [Code Generation and Synchronization - Safeguards](#) ^[1392]

11.2.1.1 Prerequisites

Before using the Model Driven Development Environment:

- You should be using the correct edition: Enterprise Architect Professional, Corporate or extended editions
- You should be connected to the required model
- Relevant source code should be imported into the model
- An Analyzer Script should be configured
- Required External frameworks should be installed

Learn More:

- [Setup](#) ^[1392]

11.2.1.2 Available Tools

This section describes the tools available in the Model Driven Development Environment:

- [Workspace Layouts](#) ^[1391]
- [Code Engineering](#) ^[1386]
- [Code Editors](#) ^[1394]
- [Intellisense](#) ^[1395]
- [Application Management](#) ^[1392]
- [Debugger Management](#) ^[1416]

11.2.1.3 Workspace Layout

You can choose from many predefined workspace layouts, depending on the tasks you perform. When you are familiar with the environment and controls available to you, you can create your own layouts.

Workspace Toolbar:

Learn More:

- [Workspace Layouts](#) ^[115]

11.2.1.4 General Workflow

In working with the Model Driven Development Environment, you apply the following workflow as a circular process, refining as necessary in each iteration.

- Configure and set up scripts
- Model - Edit - Build - Debug - Test - Profile - Deploy - Document and Analyze

Learn More:

- [Managing Scripts](#)^[1392]

11.2.1.5 Code Generation and Synchronization - Safeguards

It is important that the model and source code are kept synchronized for the Visual Execution Analyzer to produce useful results.

Use the Code Generation tools to synchronize your model after any design changes or code editing.

Always build the application prior to any Execution Analysis session - debugging, recording or profiling.

Learn More:

- [Synchronize Model and Code](#)^[1506]

11.2.2 Setup

The Execution Analyzer is a feature of Enterprise Architect, responsible for building a project, debugging code, recording a Sequence diagram and profiling information from a running program.

In order for these features to work, it is necessary to record information about the application. This is achieved in Enterprise Architect through the use of *Analyzer Scripts*.

An Analyzer Script is always associated with a package. The information you provide in a script controls the actions in, and provides support for, the following tasks:

- [Building](#)^[1415]
- [Debugging](#)^[1416]
- [Testing](#)^[1451]
- [Deployment](#)^[1453]
- [Profiling](#)^[1658]

Learn More:

- [Managing Analyzer Scripts](#)^[1392]
- [Analyzer Script Editor](#)^[1394]

11.2.2.1 Managing Analyzer Scripts

The Execution Analyzer window enables you to manage all scripts in the model, using the window toolbar buttons to control script tasks. Many features, such as Debugging, Testing, Profiling and Simulation, depend on and function according to how the active script has been configured.

Scripts are listed by package; packages that do not have any scripts are not displayed.

Each user can activate one script at any time, independent of other users of the same model; one user activating a script does not impact the currently active scripts for other users or affect the scripts available to them.

Access: **Analyzer | Execution Analyzer (Shift + F12)**

Toolbar Button	Action	See Also
	List the Analyzer windows; select and display the required window	Debugging ^[1416] Breakpoint and Marker Management ^[1436] View the Call Stack ^[1441] View the Local Variables ^[1442] View Variables in Other Scopes ^[1444] Inspect Process Memory ^[1445] The Recording History ^[1651] The Testpoints Window ^[1676] Profiling Native Applications ^[1658] Model Simulation ^[1681]
	Add new Analyzer Script A prompt displays to select the parent package	Analyzer Script Editor ^[1394]
	Export Scripts You can export one or more Analyzer Scripts to an XML file, which can be used to import the scripts into another model; a prompt displays for the target file name and location	
	Import Scripts You can import one or more Analyzer Scripts from a previously exported XML file; a prompt displays for the source file name and location	
	Execute the Debug command of the active script	Setup for Debugging ^[1417]
	Execute the Build command of the active script	Add Commands ^[1415]
	Execute the Test command of the active script	Add Testing Command ^[1451]
	Execute the Run command of the active script	Add Run Command ^[1451]
	Execute the Deploy command of the active script	Add Deploy Command ^[1453]
	Display the Help topic for this window	

11.2.2.2 Analyzer Script Editor

Scripts are associated with a Package. When you create an Analyzer Script you can define a number of actions. The Execution Analyzer Script Editor has a number of pages for configuring various features:

If you plan to use any of the features of the Execution Analyzer, you must complete at least the Build and Debug pages.

Task	Page	Actions	See also
Build	Build	Enter script or command to build the application	Build ^[1415]
	Clean	Enter script or command to clean the previous build	Clean ^[1416]
Test	Test	Enter script or command to test the application	Test ^[1451]
	Testpoints	Specify where the output from a Testpoint run is sent	Testpoint Output ^[1453]
Debug	Platform	Specify the debugging platform, the application to be debugged, and the mode of debugging (attach to process or run)	Debug ^[1416]
	Tracepoints	Specify where the output from Tracepoints encountered during a debug session are sent	Trace Output ^[1435]
	Workbench	Specify required information for using the Object Workbench control	Workbench Setup ^[1663]
Run	Run	Enter a script or command to run the application	Run ^[1451]
Deploy	Deploy	Enter a script or command to deploy the project	Deploy ^[1453]

11.2.3 Code Editors

Enterprise Architect provides a number of editors that you can use across the development environment to maintain scripts, code and templates. Each editor has its own features, but they are all based on a common *Code Editor control*.

Topics:

Topic	Detail	See also
Editors	<p>The provided editors are:</p> <ul style="list-style-type: none"> • Shape Script Editor* • Code Generation Template Editor* • Transformation Template Editor* • Custom SQL Search Filter Editor* • Database View Editor* • HTML Report Template Editor • Source Code Viewer* • Script Editor* <p>You can have several code editors (or files within a code editor) open at the same time, as separate tabs in the central view area of the Enterprise Architect work area</p> <p>You can also close the editors individually or all together, leaving views of other types (such as diagrams or RTF reports) still open</p>	Shape Script Editor ^[1090] Code Generation Template Editor ^[1485] Transformation Template Editor ^[1330] Custom SQL Search Filter Editor ^[484] Database View Editor ^[1371] HTML Report Template Editor ^[1804] Source Code Viewer* ^[1408] Script Editor ^[1407] Diagram Tabs ^[543]
Code Editor	<p>The common Code Editor provides a variety of functions to assist with the code editing process, including:</p> <ul style="list-style-type: none"> • Syntax Highlighting • Bookmarks • Cursor history • Brace matching • Automatic indentation • Commenting selections • Scope guides • Zooming • Line selection • intellisense • Find and Replace • Find in Files <p>A range of these functions is available through keyboard key combinations and/or context menu options</p> <p>You can customize several of the Code Editor features by setting properties in the Code Editor configuration files; for example, by default the line containing the cursor is always highlighted, but you can turn the highlighting off</p> <p>Additional information is provided in the <i>Code Editor Configuration Guide</i>, located as a PDF file in the <i>Config</i> directory under your Enterprise Architect installation directory</p>	Syntax Highlighting ^[1395] Bookmarks ^[1396] Cursor history ^[1396] Brace matching ^[1397] Automatic indentation ^[1397] Commenting selections ^[1397] Scope guides ^[1398] Zooming ^[1398] Line selection ^[1399] intellisense ^[1399] Find and Replace ^[1412] Find in Files ^[1454] Code Editor Key Bindings ^[1400] Code Editor Context Menu ^[1404]

11.2.3.1 Syntax Highlighting

The Code Editor highlights - in colored text - the standard code syntax of most language file formats supported by Enterprise Architect. You can define how the Code Editor implements syntax highlighting, through the Code Editors page of the Options dialog.

Topics:

Topic	Detail	See also
Supported Languages	<ul style="list-style-type: none"> • Ada (.ada, .ads, .adb) • ActionScript (.as) • BPEL Document (.bpel) • C++ (.h, .hh, .hpp, .c, .cpp, .cxx) • C# (.cs) • Delphi/Pascal (.pas) • Diff/Patch Files (.diff, .patch) • Document Type Definition (.dtd) • DOS Batch Files (.bat) • DOS Command Scripts (.cmd) • HTML (.html) • Interface Definition Language (.idl, .odl) • Java (.java) • Javascript (.javascript) • JScript (.js) • Modified Backus-Naur Form Grammar (.mbnf) • PHP (.php, .php4, .inc) • Python (.py) • Standard Generalized Markup Language (.sgml) • Structured Query Language (.sql) • SystemC (.sc) • Visual Basic 6 (.bas) • VB.NET (.vb) • VBScript (.vbs) • Verilog (.v) • VHSIC Hardware Description Language (.vhdl) • Visual Studio Resource Configuration (.rc) • eXtensible Markup Language (.xml) 	Editor Language Properties <small>1520</small>

11.2.3.2 Bookmarks

Topics:

Topic	Detail	See also
Usage	<p>Bookmarks denote a line of interest in the document; you can toggle them on and off for a particular line by pressing (Ctrl+F2)</p> <p>Additionally, you can press (F2) and (Shift+F2) to navigate to the next or previous bookmark in the document</p>	

11.2.3.3 Cursor History

Topics:

Topic	Detail	See also
Usage	<p>The Code Editor Control keeps a history of the previous 50 cursor positions</p> <p>An entry in the history list is created when:</p>	

Topic	Detail	See also
	<ul style="list-style-type: none"> The cursor is moved more than 10 lines from its previous position The cursor is moved in a <i>find/replace</i> operation <p>You can navigate to an earlier point in the cursor history by pressing (Ctrl+-), and to a later point by pressing (Ctrl+Shift+-)</p>	

11.2.3.4 Brace Matching

Topics:

Topic	Detail	See also
Usage	<p>When you place the cursor over a brace or bracket, the Code Editor highlights its corresponding partner. You can then navigate to the matching brace by pressing (Ctrl+E)</p> <pre> 27 function GetPublishedPropertyTest4: Extended; 28 function ProtectedFunctionTest: boolean; 29 procedure ProtectedProcedureTest(a: WideString); 30 function SetPublishedPropertyTest4: Extended; </pre>	

11.2.3.5 Automatic Indentation

Topics:

Topic	Detail	See also
Usage	<p>For each supported language, the Code Editor adjusts the indentation of a new line according to the presence of control statements or scope block tokens in the lines leading up to the cursor position</p> <p>For more information on customizing automatic indentation for a language, see the <i>Configuration Guide</i></p>	Code Editors <small>[1394]</small>

11.2.3.6 Commenting Selections

Topics:

Topic	Detail	See also
Usage	<p>For languages that support comments, the Code Editor can comment entire selections of code</p> <p>The Code Editor recognizes two types of commenting:</p> <ul style="list-style-type: none"> Line Commenting - entire lines are commented from the start (for example: <pre>// This is a comment</pre> Stream Commenting - sections of a line are commented from a specified start point to a specified end point (for example: <pre>/* This is a comment */</pre> 	Code Editors <small>[1394]</small>

Topic	Detail	See also
	<p>You can toggle comments on the current line or selection by pressing:</p> <ul style="list-style-type: none"> • (Ctrl+Shift+C) for line comments, or • (Ctrl+Shift+X) for stream comments <p>For more information on customizing selection commenting for each language, see the <i>Configuration Guide</i></p>	

11.2.3.7 Scope Guides

Topics:

Topic	Detail	See also
Usage	<p>If the cursor is placed over an indentation marker, the Code Editor performs a 'look back' to find the line that started the scope at that indentation level; if the line is found and is currently on screen, it is highlighted in light blue</p> <pre> 93 // If there were any answers, then return a packet, if not then just return null 94 // to indicate the server has no response 95 if (answers.size() > 0) 96 { 97 DNSPacket responsePacket = Helpers.createResponsePacket(answers, this.theS 98 responsePacket.queryID = receivedPacket.queryID; 99 100 return responsePacket; 101 } 102 else 103 { 104 return null; 105 } </pre> <p>Alternatively if the line is off screen, a calltip is displayed advising of the line number and contents.</p> <pre> 93 // If there were any answers, then return a packet, if not then just return null 94 // to indicate the server has no response 95 if (answers.size() > 0) 96 { 97 DNSPacket responsePacket = Helpers.createResponsePacket(answers, this.theS 98 responsePacket.queryID = receivedPacket.queryID; 99 100 return responsePacket; 101 } 102 else 103 { 104 return null; 105 } </pre> <p>Line 97: private DNSPacket processQuery(DNSPacket receivedPacket)</p>	

11.2.3.8 Zooming

Topics:

Topic	Detail	See also
Usage	<p>You can zoom into and out of the contents of the Code Editor using:</p> <ul style="list-style-type: none"> • (Ctrl) + keypad (+) and • (Ctrl) + keypad (-) 	

Topic	Detail	See also
	Zoom can be restored to 100% using (Ctrl) + keypad (/)	

11.2.3.9 Line Selection

Topics:

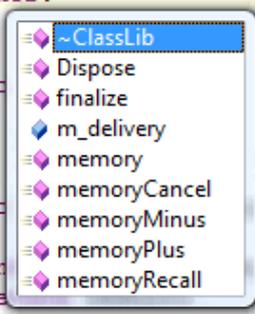

Topic	Detail	See also
Usage	If you want to move the cursor to a specific line of code, press (Ctrl + G) and, in response to the prompt, type in the line number Press the OK button; the editor displays the specified line of code with the cursor at the left	

11.2.3.10 Intellisense

Intellisense is a feature that provides choices of code items and values as you type. Not all code editors use intellisense; those that do are indicated by an asterisk in the list of Enterprise Architect code editors. Intellisense provides you with context-based assistance through autocompletion lists, calltips and mouseover information.

Intellisense is also disabled while you record a macro in the Source Code Viewer.

Topics:

Topic	Detail	See also
Autocompleti on List	<p>An autocompletion list provides a list of possible completions for the current text; the list is automatically invoked when you enter an accessor token (such as a period or pointer accessor) after an object or type that contains members</p> <pre> 57 public void memoryRecall() 58 { 59 this. 60 } 61 62 public 63 64 } 65 66 public memoryCancel (int number1, int number2) 67 { 68 in 69 re 70 } 71 </pre>  <p>You can also invoke the autocompletion list manually by pressing (Ctrl + Spacebar); the Code Editor then searches for matches for the word leading up to the invocation point</p> <p>Select an item from the list and press (Enter) or (Tab) to insert the item into</p>	

Topic	Detail	See also
	the code; to dismiss the autocompletion list, press (Escape)	
Calltips	<p>Calltips display the current method's signature when you type the parameter list token (for example, opening parenthesis); if the method is overloaded, the calltip displays arrows that you can use to navigate through the different method signatures</p> <pre> 20 //PostDraw Adornments 21 //Stereotyped Static Adornments 22 //Add Stakeholder's STAKE 23 setpenwidth(24 // Add a the 25 startpath(26 moveto(25,37); 27 lineto(25,52); 28 endpath(); 29 strokepath(); 30 //Add tip </pre>	
Mouseover Information	<p>You can display supporting documentation for code elements (for example, attributes and methods) by hovering the cursor over the element in question</p> <pre> 11 dockable = "none"; 12 string 13 / Dock elements together. Tagged V 14 Valid Values: none, standard 15 //PreDraw Derived Attribute I </pre>

11.2.3.11 Code Editor Key Bindings

Key	Description
Ctrl + G	Move cursor to a specified line
↓	Move cursor down one line
Shift + ↓	Extend selection down one line
Ctrl + ↓	Scroll down one line
Alt + Shift + ↓	Extend rectangular selection down one line
↑	Move cursor up one line
Shift + ↑	Extend selection up one line
Ctrl + ↑	Scroll up one line

Key	Description
Alt + Shift + ↑	Extend rectangular selection up one line
Ctrl+ (Move cursor up one paragraph
Ctrl+Shift+ (Extend selection up one paragraph
Ctrl+)	Move cursor down one paragraph
Ctrl+Shift+)	Extend selection down one paragraph
←	Move cursor left one character
Shift + ←	Extend selection left one character
Ctrl + ←	Move cursor left one word
Ctrl + Shift + ←	Extend selection left one word
Alt + Shift + ←	Extend rectangular selection left one character
→	Move cursor right one character
Shift + →	Extend selection right one character
Ctrl + →	Move cursor right one word
Ctrl + Shift + →	Extend selection right one word
Alt + Shift + →	Extend rectangular selection right one character
Ctrl + /	Move cursor left one word part
Ctrl + Shift + /	Extend selection left one word part
Ctrl + \	Move cursor right one word part
Ctrl + Shift + \	Extend selection right one word part
Home	Move cursor to the start of the current line
Shift + Home	Extend selection to the start of the current line
Ctrl + Home	Move cursor to the start of the document
Ctrl + Shift + Home	Extend selection to the start of the document
Alt + Home	Move cursor to the absolute start of the line
Alt + Shift + Home	Extend rectangular selection to the start of the line
End	Move cursor to the end of the current line

Key	Description
Shift + End	Extend selection to the end of the current line
Ctrl + End	Move cursor to the end of the document
Ctrl + Shift + End	Extend selection to the end of the document
Alt + End	Move cursor to the absolute end of the line
Alt + Shift + End	Extend rectangular selection to the end of the line
Page Up	Move cursor up a page
Shift + Page Up	Extend selection up a page
Alt + Shift + Page Up	Extend rectangular selection up a page
Page Down	Move cursor down a page
Shift + Page Down	Extend selection down a page
Alt + Shift + Page Down	Extend rectangular selection down a page
Delete	Delete character to the right of the cursor
Shift + Delete	Cut selection
Ctrl + Delete	Delete word to the right of the cursor
Ctrl + Shift + Delete	Delete until the end of the line
Insert	Toggle overwrite
Shift + Insert	Paste
Ctrl + Insert	Copy selection
Backspace	Delete character to the left of the cursor
Shift + Backspace	Delete character to the left of the cursor
Ctrl + Backspace	Delete word to the left of the cursor
Ctrl + Shift + Backspace	Delete from the start of the line to the cursor
Alt + Backspace	Undo delete
Tab	Indent cursor one tab
Ctrl + Shift + I	Indent cursor one tab
Shift + Tab	Unindent cursor one tab

Key	Description
Ctrl + keypad(+)	Zoom in
Ctrl + keypad(-)	Zoom out
Ctrl + keypad(/)	Restore Zoom
Ctrl + Z	Undo
Ctrl + Y	Redo
Ctrl + X	Cut selection
Ctrl + C	Copy selection
Ctrl + V	Paste
Ctrl + L	Cut line
Ctrl + Shift + L	Delete line
Ctrl + T	Transpose line
Ctrl + Shift + T	Copy line
Ctrl + A	Select entire document
Ctrl + D	Duplicate selection
Ctrl + U	Convert selection to lowercase
Ctrl + Shift + U	Convert selection to uppercase
Ctrl + E	Move cursor to matching brace
Ctrl + Shift + E	Extend selection to matching brace
Ctrl + Shift + C	Toggle line comment on selection
Ctrl + Shift + X	Toggle stream comment on selection
Ctrl + F2	Toggle bookmark
F2	Go to next bookmark
Shift + F2	Go to previous bookmark
Ctrl + Shift + W	Toggle whitespace characters

Key	Description
Ctrl + Shift + L	Toggle EOL characters
Ctrl + Spacebar	Invoke autocomplete
Ctrl + -	Go backwards in cursor history
Ctrl + Shift + -	Go forwards in cursor history
F12	Start/Cancel search for keyword in file(s).
Ctrl + F	Find text
Ctrl + R	Replace

Notes:

- In addition to the following keys, you can assign (**Ctrl + Alt + n**) key combinations to macros that you define within the Source Code Editor

11.2.3.12.1 Create Use Case for Method

The code editor context menu enables you to create a Use Case element for a method that you select from the code. You can also link the Use Case directly to the method in a diagram, and hide any attributes or methods that are not the targets of feature links.

How To:

To create a Use Case for a method, follow the steps below:

Step	Action	See also
1	If you want to depict the Use Case and its link to the method in a diagram, click on the diagram name in the Project Browser	
2	In the code editor, right click on either the method name or any part of the method body, and select the Create Method for <methodname> context menu option The Create Use Case for Method dialog displays	
3	The basic function of this dialog is to create a Use Case for the selected method: <ul style="list-style-type: none"> If this is all that is required, click on the OK button. The Use Case element is created in the Project Browser, in the same package as the parent Class for the method, and with the same name as the method If you intend to make the relationship tangible, continue with the procedure 	
4	To create a Trace connector linking the Use Case to the method, select the Link Use Case to Method check box.	
5	To add the method's parent Class to the diagram, if it is not already there, select the Add Class to Diagram check box.	
6	To add the newly-created Use Case to the diagram, select the Add Use Case to Diagram check box. This would now show the Use Case, Class and Trace connector on the diagram.	
7	To only show the features (attributes and methods) of the parent Class that are the targets of 'link to feature' relationships, select the Display only linked features in Class checkbox. The Class might contain any number of attributes and methods, but those without a 'link to feature' relationship are hidden.	Connect to Element Feature ^[742]
8	Click on the OK button to create and depict the Use Case and relationship. If you selected all options, the diagram now contains linked elements	

Step	Action	See also

11.2.3.13 Script Editor

The *Script Editor* enables you to edit scripts, and to run and stop an open script.

The editor is based on, and provides the facilities of, the common **Code Editor**.

To open the Script Editor, double-click on the required script in the **Scripts** tab of the **Scripting window**. The editor opens in the main work area.

Use to:

- Save changes to the current script
- Save the current script under a different name
- Run the script
- Stop the executing script
- View the script output in the **Scripts** tab of the **Output** window

Topics:

Topic	Detail	See also
Enterprise Architect Script Objects	<p>Enterprise Architect adds to the available functionality and features of the editor script language by providing inbuilt objects. These are either <i>Type Libraries</i>, providing intellisense for editing purposes, or <i>Runtime objects</i>, providing access to objects of the types described in the Type Libraries.</p> <p>The available intellisense scripting objects are:</p> <ul style="list-style-type: none"> • EA • MathLib • System • The runtime scripting objects (below) <p>The available runtime scripting objects are:</p> <ul style="list-style-type: none"> • Repository (Type: IDualRepository) - this is the Enterprise Architect automation interface • Maths (Type: IMath) • Session (Type: ISession) 	Automation Interface ^[1822]

Topic	Detail	See also
Script Editing Intellisense (Required Syntax)	<p>Intellisense is available not only in the Script Editor, but also in the Script Console. Intellisense at its most basic is presented for the inbuilt functionality of the script engine. For intellisense on the additional Enterprise Architect scripting objects listed above, you must declare variables according to syntax that specifies a type. It is not necessary to use this syntax to execute a script properly. It is only present so that the correct intellisense can be displayed for an item. The syntax can be seen in the above diagram in, for example:</p> <pre>Dim e as EA.Element</pre> <p>Then, when you type, in this case, e. the editor displays a list of member functions and properties of e's type.</p> <p>You select one of these to complete the line of script. You might, therefore, type:</p> <pre>VTrace(e.</pre> <p>As you type the period, the editor presents the appropriate list and you might double-click on, for example, Abstract. This is inserted in the line, and you continue to type or select the rest of the statement. In this case, adding the end space and parenthesis.</p> <pre>VTrace(e. Abstract)</pre>	
Keystrokes	<p>In the Script Editor or Console, intellisense is presented on the following keystrokes.</p> <ul style="list-style-type: none"> • Press (.) (period) after an item to list any members for that item's type • Press (Ctrl) +(Spacebar) on a word to list any intellisense items with a name starting with the string at the point keystroke was pressed • Press (Ctrl) +(Spacebar) when not on a word to display any available top level intellisense items - these are the intellisense objects described above plus any built-in methods and properties of the current scripting language 	

Notes:

- This facility is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions
- Enterprise Architect's scripting supports declaring variables to match the EA types. This enables the editor to present **intellisense**, but is not necessary for executing the script

11.2.3.14 The Source Code Viewer

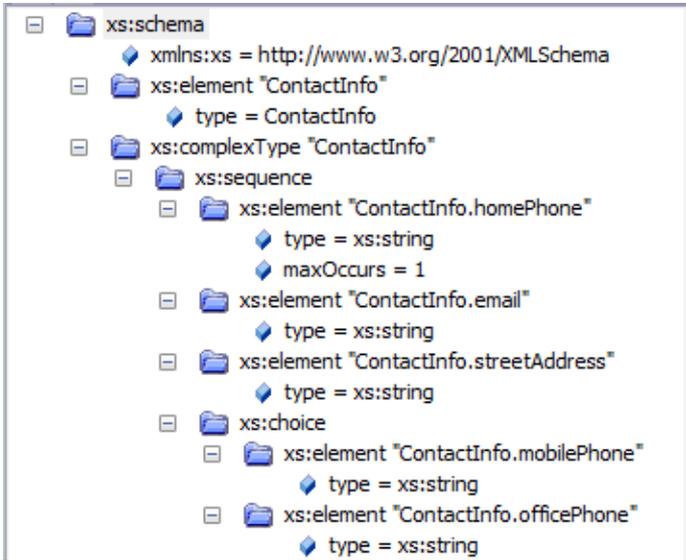

Access: **View | More Element Tools | Source Code** (Alt+7)
Tools | Open Source File (Ctrl+Alt+O)

Use the Source Code viewer to view any source code files for an element. If a Class is selected, the Source Code viewer shows the source code for that Class, provided it has already been *generated*. For C++ a second tab displays to show the implementation file.

The Source Code viewer also displays any DDL generated for a selected table in your diagram.

A number of options change the way the Source Code viewer works. They can be altered via the Options dialog (select the **Tools | Options | Source Code Engineering | Code Editors** menu option). There are also many options for developing the code, available through the code editor context menu and through the Toolbar.

Topics:

Topic	Detail	See also
Source Code Viewer	<p>By default the Source Code viewer is set to:</p> <ul style="list-style-type: none"> • Parse all opened files, and show a tree of the results • Show line numbers <p>If you are editing an XML file, the structure tree is presented in a folder hierarchy rather than a Class structure hierarchy, as follows:</p>  <pre> xs:schema ├── xmlns:xs = http://www.w3.org/2001/XMLSchema ├── xs:element "ContactInfo" │ └── type = ContactInfo ├── xs:complexType "ContactInfo" │ └── xs:sequence │ ├── xs:element "ContactInfo.homePhone" │ │ ├── type = xs:string │ │ └── maxOccurs = 1 │ ├── xs:element "ContactInfo.email" │ │ └── type = xs:string │ ├── xs:element "ContactInfo.streetAddress" │ │ └── type = xs:string │ └── xs:choice │ ├── xs:element "ContactInfo.mobilePhone" │ │ └── type = xs:string │ └── xs:element "ContactInfo.officePhone" │ └── type = xs:string </pre>	
External File Editor	<p>If you intend to edit external code, XML and DDL files (that is, code not selected from the Project Browser) use the Tools Open Source File menu option, or press (Ctrl+Alt+O).</p> <p>If you try to close the window or select another file, the editor prompts you to save your changes.</p>	
File Parsing	<p>The Source Code viewer parses files for a number of reasons. The first is to enable it to jump to the location in the file at which the currently selected item is found (but not when editing external files).</p> <p>Additionally, parsing displays a structure tree showing an overview of the file in a similar fashion to the main Project Browser. You can also select anything in that and jump to the appropriate line in the editor.</p> <p>The viewer cannot parse DDL, and therefore does not show the structure tree for a DDL file.</p>	

Notes:

- You view source code for an element by selecting menu options in a number of places, or by pressing

either (**Ctrl+E**) or (**F12**) . If the element does not have a generation file (that is, code has not been or cannot be generated, such as for a Use Case), Enterprise Architect checks whether the element has a link to either an operation or an attribute of another element. If such a link exists, and that other element has source code, the code for that element displays

11.2.3.15 Find and Replace

Each of Enterprise Architect's code editors facilitates searching for and replacing terms in the editor, through the **Find and Replace** dialog.

Access:

Highlight the required text string and press:

- **(Ctrl+F)** for the find controls only, or
- **(Ctrl+R)** for both find and replace controls

In each instance, the **Find what** field is populated with the text currently selected in the editor. If no text is selected in the editor, the **Find what** field is populated with the word at the current cursor position. If no word exists at the current cursor position, the last searched-for term is used.

Basic Operations

Commands:

Command	Action	See also
Find Next	Locate and highlight the next instance (relative to the current cursor position) of the text specified in the Find what field.	
Replace	Replace the current instance of the text specified in the Find what field with the text specified in the Replace with field, and then locate and highlight the next instance (relative to the current cursor position) of the text specified in the Find what field.	
Replace All	Automatically replace all instances of the text specified in the Find what field with the text specified in the Replace with field.	

Options:

Option	Action	See also
Match Case	Specify that the case of each character in the text string in the Find what field is significant when searching for matches in the code.	
Match whole word	Specify that the text string in the Find what field is a complete word and should not be matched with instances of the text that form part of a longer string. For example, searches for ARE should not match those letters in instances of the words AREA or ARENA.	
Search up	Perform the search from the current cursor position up to the start of the file, rather than in the default direction of current	

Option	Action	See also
	cursor position to end of file.	
Use Regular Expressions	Evaluate specific character sequences in the Find what and Replace with fields as <i>Regular Expressions</i> (see below).	

Topics:

Topic	Detail	See also												
Regular Expressions	<p>A Regular Expression is a formal definition of a search pattern, which can be used to match specific characters, words or patterns of characters. For the sake of simplicity, the Code Editor's 'find and replace' mechanism supports only a subset of the standard Regular Expression grammar.</p> <p>Text in the Find what and Replace with fields is only interpreted as a Regular Expression if the Use Regular Expressions checkbox is selected in the Find and Replace dialog.</p>													
Meta sequences	<p>If the Use Regular Expressions checkbox is selected, most characters in the Find what field are treated as literals (that is, they match only themselves). The exceptions are called <i>metasequences</i>. Each <i>metasequence</i> recognized in the Code Editor Find and Replace dialog is described in the following table.</p> <table border="1"> <thead> <tr> <th>Metasequence</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>.</td> <td>Represents any single character. For example: .at is matched to cat, hat, bat and rat.</td> </tr> <tr> <td>\<</td> <td>Indicates that the text is the start of a word. For example: \<cat is matched to catastrophe and cataclysm, but not concatenate.</td> </tr> <tr> <td>\></td> <td>Indicates that the text is the end of a word. For example: hat\> is matched to that and chat, but not hate.</td> </tr> <tr> <td>(...)</td> <td>Indicates alternative single characters that can be matched. The characters can be specific - (chr) - or in an alphabetical or numerical range - (a-m) . For example: (hc) at is matched to hat and cat but not bat. For example: (a-m) Class is matched to any name in the range aClass - mClass.</td> </tr> <tr> <td>(^...)</td> <td>Indicates alternative single characters that should be excluded from a match. The characters can be specific - (^chr) - or in an</td> </tr> </tbody> </table>	Metasequence	Description	.	Represents any single character. For example: .at is matched to cat , hat , bat and rat .	\<	Indicates that the text is the start of a word. 11.2.4 Build

The topics in this section describe how you specify the commands to build the project or package.

- [Add Comands](#) ^[1415]
- [Recursive Builds](#) ^[1416]

11.2.4.1 Add Commands

Topics:

Topic	Detail	See also
Usage	<p>The Build page enables you to enter commands to build your project</p> <p>You can run a single program by selecting Process or multiple commands by selecting Batch File</p> <p>You can use Enterprise Architect Local Paths and environment variables in composing your command line(s)</p>	
Execute Command As:	<p>Batch File</p> <p>Use this option to enter multiple commands, which are executed as entered in a command window; the command window has access to your environment variables</p> <p>Process</p> <p>Use this option to run a single program</p> <p>The command should specify the path to the program, plus any command line arguments; if the executable path or any arguments contain spaces, they must be surrounded by quotes</p>	
Output Parser	<p>This enables you to select a method for automatically parsing the compiler output</p> <p>If you select this option, output from the script is logged in the System Output window; Enterprise Architect parses the output according to the syntax you specify</p> <p>To view the output, select the View System Output menu option</p> <p>If you double-click on an error line, Enterprise Architect loads the appropriate source file and positions the cursor on the line at which the error is reported</p>	The Output Window ^[127]

Learn More:

- [Local Paths](#) ^[1523]

11.2.4.2 Recursive Builds

Topics:

Topic	Detail	See also
Usage	<p>For any project you can apply the command entered in the build script to all sub folders of the initial directory by specifying the token <code>%r</code> immediately preceding the files to be built</p> <p>The effect of this is Enterprise Architect iteratively replaces the token with any subpath found under the root and executes the command again</p>	

11.2.5 Clean

The topics in this section describe how you specify the commands to clean the project prior to a build.

- [Add Clean Comands](#) ^[1416]
- [Recursive Builds](#) ^[1416]

11.2.5.1 Add Clean Commands

This topic explains how you enter a command to clean your project. When you execute the **Rebuild** menu option on a script the command you specify here is executed followed by the build command.

Topics:

Topic	Detail	See also
Usage	This is the command that is executed when you click the Execution Analyzer toolbar Clean button or select Clean from the script context menu	
Example	<code>devenv.com /Clean Debug MyProject.sln</code>	

11.2.6 Debugging

This section describes how you define the debugging actions:

- [How it works](#) ^[1416]
- [Setup for Debugging](#) ^[1417]
- [Tracepoint Output](#) ^[1435]
- [Breakpoint and Marker Management](#) ^[1436]
- [Debugging Actions](#) ^[1441]
- [Recording Actions](#) ^[1445]

11.2.6.1 How it Works

The Model Driven Development Environment provides Debuggers for the following frameworks:

- Microsoft Native Code applications
- Microsoft .NET applications
- Java applications
- PHP.exe applications

Checklist:

Step	Action	See also
1	A model must be open	
2	Ensure any source code for the areas of interest have been generated, or imported into the model	Synchronize Model and Code ^[1506]

Option 1 - No Analyzer Script:

If you have *not* configured an Analyzer Script, you can still debug a process that is running.

Step	Action	See also
1	Optionally set breakpoints before debugging	
2	Use the Attach button on the Debug toolbar <ul style="list-style-type: none"> Select the debugging platform Select the process to debug 	

Option 2 - Analyzer Script, with Debug Page Configured:

Step	Action	See also
1	Ensure the application has been built You can do this internally using the Build Script, or you can build the application externally; the important thing is that the application is built on the latest versions of the source	Build ^[1415]
2	Set breakpoints	Set Code Breakpoints ^[1435]
3	Start the debugger	Start & Stop Debugger ^[1447]

11.2.6.2 Setup for Debugging

To begin debugging you must specify

- The debugger to use
- The application path
- Runtime options, if applicable

You specify these on the Debug page of the Analyzer Script dialog.

Learn More:

- [Operating System Specific Requirements](#) ^[1417]

11.2.6.2.1 Operating System Specific Requirements

Important - Please read the information provided in this topic.

Topics:

Topic	Detail	See also
Prerequisites	Creation of an Analyzer script and configuration of the Debug command in that script	
Supported Platforms	<p>Enterprise Architect supports debugging on these platforms:</p> <p>.NET</p> <ul style="list-style-type: none"> • Microsoft™ .NET Framework 1.1 and later, including .NET 4 • Language support: C, C#, C++, J#, Visual Basic <p>Java</p> <ul style="list-style-type: none"> • Java 2 Platform Standard edition (J2SE) version 5.0 • J2EE JDK 1.4 and above • Requires previous installation of the Java Runtime Environment and Java Development Kit from Sun Microsystems™ <p>Debugging is implemented through the Java Virtual Machine Tools Interface (JVMTI), which is part of the Java Platform Debugger Architecture (JPDA); the JPDA is included in the J2SE SDK 1.3 and later</p> <p>Windows for Native Applications</p> <p>Enterprise Architect supports debugging native code (C, C++ and Visual Basic) compiled with the Microsoft™ compiler where an associated PDB file is available</p> <p>You can import native code into your model, and record the execution history for any Classes and methods</p> <p>You can also generate Sequence diagrams from the resulting execution path</p> <p>PHP</p> <p>Enterprise Architect enables you to perform local and remote debugging with PHP.exe</p>	

Notes:

- Debugging under Windows Vista (x64) - if you encounter problems debugging with Enterprise Architect on a 64-bit platform, you should build a Win32 platform configuration in Visual Studio; that is, do not specify **ANY-CPU**, specify **WIN32**

11.2.6.2.1.1 UAC-Enabled Operating Systems

The Microsoft operating systems *Windows Vista* and *Windows 7* provide User Account Control (UAC) to manage security for applications.

The Enterprise Architect Visual Execution Analyser is UAC-compliant, and users of UAC-enabled systems can perform operations with the Visual Execution Analyser and related facilities under accounts that are members of only the *Users* group.

However, when attaching to processes running as services on a UAC-enabled operating system, it might be necessary to log in as an Administrator.

How To:

To log in as an Administrator, follow the step below:

Step	Action	See also
1	Before you run Enterprise Architect, right-click on the Enterprise Architect icon on the desktop and select the Run as administrator option	

Alternatively, to edit or create a link to Enterprise Architect and configure the link to run as an Administrator, follow the steps below:

Step	Action	See also
1	Right-click on the Enterprise Architect icon and select the Properties menu option The Enterprise Architect Properties dialog displays	
2	Click on the Advanced button The Advanced Properties dialog displays	
3	Select the Run as administrator checkbox	
4	Click on the OK button, and again on the Enterprise Architect Properties dialog	

11.2.6.2.1.2 WINE Debugging

How To:

To configure Enterprise Architect to debug under WINE, follow the steps below:

Step	Action	See also
1	At the command line, run <code>\$ winecfg</code>	
2	Set the library overrides for <code>dbghelp</code> to (native, builtin) , and accept the warning about overriding this DLL	
3	Set <code>dbghelp</code> to native by using <code>winecfg</code>	
4	Copy the application source code plus executable(s) to your bottle The path must be the same as the compiled version; that is: If Windows source = <code>C:\Source\SampleApp</code> , under Crossover it must be <code>C:\Source\SampleApp</code>	
5	Copy any Side-By-Side assemblies that are used by the application	
6	Import the source code into Enterprise Architect (optional)	
7	Create a build script on a package Set the path of the application on the Debug tab, and set the Use Debugger field to Microsoft Native	Build ^[1415]
8	Open the Profiler (Analyzer Profile)	Visual Execution Profiler ^[1658]

Step	Action	See also
9	Click on the Launch button (first button on the Profiler window)	
10	If the sample didn't start, click on the Sampling button (third button on the Profiler window)	
11	Once you have finished profiling, shut down the application (<i>not</i> Enterprise Architect)	
12	View the Sampler report by clicking the View Report button (fifth button on the Profiler window)	

Topics:

Topic	Detail	See also
Access Violation Exceptions	<p>Due to the manner in which WINE handles direct drawing and access to DIB data, an additional option is provided on the Debug window toolbar drop-down menu to ignore or process access violation exceptions thrown when your program directly accesses DIB data</p> <p>Select this option to catch genuine (unexpected) access violations; deselect it to ignore expected violations</p> <p>As the debugger cannot distinguish between expected and unexpected violations, you might have to use trial and error to capture and inspect genuine program crashes</p>	

Notes:

- If WINE crashes, the back traces might not be correct
- If you are using MFC remember to copy the debug side-by-side assemblies to the *C:\windows\winsxs* directory
- To add a windows path to WINE, modify the Registry entry:

```
HKEY_LOCAL_MACHINE\System\Current Control Set\Control\Session
Manager\Environment
```

11.2.6.2.2 Microsoft C++ and Native (C, VB)**Topics:**

Topic	Detail	See also
Usage	<p>You can debug native code only if there is a corresponding PDB file for the executable; you normally create the PDB file as a result of building the application</p> <p>The build should include full debug information and there should be no optimizations set</p> <p>The script must specify two things to support debugging:</p> <ul style="list-style-type: none"> • The path to the executable • Microsoft Native as the debugging platform 	General Setup ^[142]

11.2.6.2.2.1 General Setup

This is the general setup for debugging Microsoft Native Applications (C++, C, Visual Basic). You have two options when debugging:

- Debug an application
- Attach to an application that is running

Option 1 -Debug an application

Field	Action	See also
Debugger	Select Microsoft Native as the debugging platform	
Mode	Select the Run radio button	
Default Directory	This is set as the default directory for the process being debugged	
Application	Select and enter either the full or the relative path to the application executable	
Command Line Arguments	Parameters to pass to the application at startup	
Show Console	Create a console window for the debugger; not applicable for attaching to a process	
Symbol Search Path	Specify any additional paths to locate debug symbols for the debugger; separate the paths with a semi-colon	

Option 2 - Attach to an application that is running

Field	Action	See also
Debugger	Select Microsoft .NET as the debugging platform	
Mode	Select the Attach to Process radio button	
Symbol Search Path	Specify any additional paths to locate debug symbols for the debugger You could specify a symbol server here if you prefer; separate the paths with a semi-colon or comma	

11.2.6.2.2.2 Debug Symbols

Topics:

Topic	Detail	See also
Abstract	For applications built using <i>Microsoft Platform SDK</i> , Debug Symbols are written to an application PDB file when the application is built The <i>Debugging Tools for Windows</i> , an API used by the Visual Execution Debugger, uses these symbols to present meaningful information to Execution Analyzer controls These symbols can easily get out of date and cause errant behaviour - the debugger might highlight the wrong line of code in the editor whilst at a	

Topic	Detail	See also
	<p>breakpoint; it is therefore best to ensure the application is built prior to any debugging or recording session</p> <p>The debugger must inform the API how to reconcile addresses in the image being debugged; it does this by specifying a number of paths to the API that tell it where to look for PDB files</p> <p>For system DLLs (<i>kernel32</i>, <i>mfc90ud</i>) for which no debug symbols are found, the Call Stack shows some frames with module names and addresses only</p> <p>You can supplement the symbols translated by passing additional paths to the API; you pass additional symbol paths in a semi-colon separated list in the Debug tab</p>	

11.2.6.2.3 Java

This section describes how to set up Enterprise Architect for debugging Java applications and Web Servers.

Learn More:

- [General Setup for Java](#) ^[1422]
- [Advanced Techniques](#) ^[1423]
- [Working with Java Web Servers](#) ^[1425]

11.2.6.2.3.1 General Setup for Java

This is the general setup for debugging Java Applications. You have two options when debugging.

- Debug an Application
- Attach to an application that is running

Option 1 - Debug an Application

Field	Action	See also
Debugger	Select Java	
Mode	Select Run	
Default Directory	This path is added to the class path property when the Java Virtual Machine is created	
Application Class	<p>Identify the fully qualified Class name to debug; the Class must have a method declared with the following signature:</p> <pre>public static void main(String());</pre> <p>Application Class <input type="text" value="samples.Collector"/></p> <p>Command Line Arguments: </p>	

Field	Action	See also
Java Virtual Machine Options	<p>Specify command line options for Virtual Machine creation</p> <p>You also must provide a parameter (jre) that is a path to be searched for the <code>jvm.dll</code>; this is the DLL supplied as part of the Java runtime environment or Java JDK from Sun Microsystems™</p> <p>Java Virtual Machine Options:</p> <pre>jre=%JAVA%\jre,-Djava.class.path=%classpath%;;</pre> <p>In the example above, a virtual machine is created with a new Class path property that comprises any paths named in the <code>CLASSPATH</code> environment variable plus the default directory</p> <p>If no Class path is specified, the debugger always creates the virtual machine with a Class path property equal to any path contained in the environment variable plus the path entered in the default working directory of this script</p> <p>If source files and <code>.class</code> files are located under different directory trees, the Class path property MUST include both root path(s) to the source and root path(s) to binary class files</p>	

Option 2 - Attach to Virtual Machine

There is very little to specify when attaching to a VM; however, the VM must have the Sparx Systems debugging agent loaded.

Field	Action	See also
Debugger	Select Java	Attach to Virtual Machine ^[1424]
Mode	Select Attach to Virtual Machine	Debug Tomcat Server ^[1428]

11.2.6.2.3.2 *Advanced Techniques*

In addition to the standard Java debugging techniques, you can:

- [Attach to a Virtual Machine](#)^[1424]
- [Debug Internet Browser Java Applets](#)^[1424]

Topics:

Topic	Detail	See also
Abstract	<p>You can debug a Java application by attaching to process that is hosting a Java Virtual Machine; you might want to do this for attaching to a webserver such as Tomcat or JBOSS</p> <p>The <i>Java Virtual Machine Tools Interface</i> from Sun Microsystems, is the API used by Enterprise Architect; it allows a debugging agent to be specified when the JVM is created</p> <p>To debug a running JVM from Enterprise Architect, the Sparx Systems' debugging agent must have been specified as a startup option to the JVM when it was started; how this accomplished for products such as Tomcat and JBOSS should be researched from that product's own documentation</p> <p>For <i>java.exe</i>, the command line option to load the Enterprise Architect debugging agent is:</p> <pre>- agent lib: SSJavaProfiler75</pre> <p>or:</p> <pre>- agent path: "c:\program files\sparx systems\ea\SSJavaProfiler75"</pre> <p>It is not necessary to configure an Analyzer Script when you attach to a Virtual Machine; you can just use the Attach button on one of the Analyzer toolbars</p> <p>If you configure an Analyzer Script, there are only two things that must be selected:</p> <ul style="list-style-type: none"> • Select Java as the debugging platform • Choose the Attach to Virtual Machine option 	

This topic describes the configuration requirements and procedure for debugging Java Applets running in a browser from Enterprise Architect.

How To:

To attach to the browser process hosting the Java Virtual Machine (JVM) from Enterprise Architect, follow the steps below:

Step	Action	See also
1	Ensure binaries for the applet code to be debugged have been built with debug information	
2	Configure the JVM using the Java Control Panel	
3	In the Java Applet Runtime Settings panel, click on the View button	
4	<p>On the installed version to use, include the following option in the Runtime Parameters field:</p> <pre>- agent path: c:\program files\sparx systems\ea\SSJavaProfiler75</pre>	
5	<p>In this field add the required Class paths</p> <p>At least one of these paths should include the root path of the source files to use</p>	

Step	Action	See also
	in debugging	
6	Set breakpoints	Breakpoint and Marker Management ^[1436]
7	Launch the browser	
8	Attach to the browser process from Enterprise Architect	

11.2.6.2.3.3 Working with Java Web Servers

This topic describes the configuration requirements and procedure for debugging Java web servers such as JBOSS and Apache Tomcat (both Server configuration and Windows Service configuration) in Enterprise Architect.

How To:

To attach to the process hosting the Java Virtual Machine from Enterprise Architect, follow the steps below:

Step	Action	See also
1	Ensure binaries for the web server code to be debugged have been built with debug information	
2	Launch the server with the Virtual Machine startup option described in <i>Server Configuration</i> , below	
3	Import source code into the Enterprise Architect Model, or synchronize existing code	
4	Set breakpoints	Breakpoint and Marker Management ^[1436]
5	Launch the client	
6	Attach to the process from Enterprise Architect	

Topics:

Topic	Detail	See also
Server Configuration	<p>The configuration necessary for the web servers to interact with Enterprise Architect must address the following two essential points:</p> <ul style="list-style-type: none"> Any VM to be debugged, created or hosted by the server must have the Sparx Systems Agent <code>SSJavaProfiler75</code> command line option specified in the VM startup option (that is: <code>-agentlib:SSJavaProfiler75</code>) The CLASSPATH, however it is passed to the VM, must specify the root path to the package source files 	

Topic	Detail	See also
	<p>The Enterprise Architect debugger uses the <code>java.class.path</code> property in the VM being debugged, to locate the source file corresponding to a breakpoint occurring in a Class during execution; for example, a Class to be debugged is called:</p> <p style="padding-left: 40px;">a . b . C</p> <p>This is located in physical directory:</p> <p style="padding-left: 40px;">C : \ s o u r c e \ a \ b</p> <p>So, for debugging to be successful, the CLASSPATH must contain the root path:</p> <p style="padding-left: 40px;">c : \ s o u r c e</p>	
Analyzer Script Configuration	<p>Using the Debug tab of the Build Script dialog, create a script for the code you have imported and:</p> <ul style="list-style-type: none"> • Select the Attach to process radio button and, in the field below, type attach • In the Use Debugger field, click on the drop-down arrow and select Java <p>All other fields are unimportant; the Directory field is normally used in the absence of any Class path property</p>	General Setup for Java ^[1422]

How To:

To debug, follow the steps below:

Step	Action	See also
1	<p>Ensure that the server is running, and that the server process has loaded the Sparx Systems Agent</p> <p>DLL SSJavaPr of i l e r 75. DLL</p> <p>(Use <i>Process Explorer</i> or similar tools to prove this)</p>	
2	In Enterprise Architect, open the source code and set some breakpoints	Breakpoint and Marker Management ^[1436]
3	<p>Click on the Debug button in Enterprise Architect</p> <p>The Attach To Process dialog displays</p>	Start and Stop Debugger ^[1447]
4	Select the server process hosting the application	
5	<p>Click on the OK button</p> <p>A confirmation message displays in the Debug Output window, stating that the process has been attached</p>	

The breakpoints could show a question mark. In this case the Class might not have been loaded yet by the VM. If the question mark remains even after you are sure the Class containing the breakpoint has been loaded, then either:

- The binaries being executed by the server are not based on the source code
- The debugger cannot reconcile the breakpoint to a source file (check class paths), or
- The JVM has not loaded the Sparx Systems agent

11.2.6.2.4 .NET

This section describes how to configure Enterprise Architect for debugging .NET applications. It covers:

- [General Setup](#)^[1429]
- [Debugging Managed code in an Unmanaged Application](#)^[1429]
- [Debug COM Interop](#)^[1430]
- [Debug ASP.NET](#)^[1431]

11.2.6.2.4.1 General Setup for .NET

This is the general setup for debugging Microsoft .NET applications. You have two options when debugging:

- Debug an Application
- Attach to an application that is running

Option 1 - Debug an application

Field	Action	See also
Debugger	Select Microsoft .NET as the debugging platform	Debugging Unmanaged Code <small>[1429]</small> Debugging ASP.NET <small>[1431]</small>
Mode	Select the Run radio button	
Default Directory	This is set as the default directory for the process being debugged	
Application	Select and enter either the full or the relative path to the application executable	
Command Line Arguments	Parameters to pass to the application at startup	
Show Console	Create a console window for the debugger; not applicable to attaching to a process	
Symbol Search Path	Specify any additional paths to locate debug symbols for the debugger; separate the paths with a semi-colon	

Option 2 - Attach to an application that is running

Field	Action	See also
Debugger	Select Microsoft .NET as the debugging platform	Debugging Unmanaged Code <small>[1429]</small> Debugging ASP.NET <small>[1431]</small>
Mode	Select the Attach to Process radio button	

11.2.6.2.4.2 Debugging an Unmanaged Application

Topics:

Topic	Detail	See also
Usage	<p>If you are debugging managed code using an unmanaged application, the debugger might fail to detect the correct version of the Common Language Runtime (CLR) to load</p> <p>You should specify a config file if you don't already have one for the debug application specified in the Debug command of your script</p> <p>The config file should reside in the same directory as your application, and take the format:</p>	http://www.msdn2.microsoft.com/en-us/library/9w519wzk.aspx (Online Resource)

Topic	Detail	See also
	<p><code>name.exe.config</code> where <i>name</i> is the name of your application</p> <p>The version of the CLR you specify should match the version loaded by the managed code invoked by the debuggee</p> <p>The following is a sample config file:</p> <pre><configuration> <startup> <requiredRuntime version="version" /> </startup> </configuration></pre> <p><i>Version</i> is the version of the CLR targeted by your plugin or COM code</p>	

11.2.6.2.4.3 Debug COM Interop

Enterprise Architect enables you to debug .NET managed code executed using COM in either a Local or an In-Process server.

This feature is useful for debugging Plugins and ActiveX components.

How To:

Step	Action	See also
1	Create a package in Enterprise Architect and import the code to debug	Software Engineering 
2	Ensure the COM component is built with debug information	
3	Create a Script for the Package	
4	In the Debug tab, you can select to either attach to an unmanaged process or specify the path to an unmanaged application to call your managed code	
5	Add breakpoints in the source code to debug	

Topics:

Topic	Detail	See also
Attach to an Unmanaged Process	<p>If you are using:</p> <ul style="list-style-type: none"> An In-Process COM server, attach to the client process A Local COM Server, attach to the server process <p>Click on the Debug window Run button (or press (F6)) to display a list of processes from which you can choose</p>	

Notes:

- Detaching from a COM interop process you have been debugging terminates the process; this is a known issue for Microsoft .NET Framework, and information on it can be found on many of the MSDN .NET blogs

11.2.6.2.4.4 Debug ASP .NET

Topics:

Topic	Detail	See also
Usage	<p>Debugging for web services such as ASP requires that the Enterprise Architect debugger is able to attach to a running service</p> <p>Begin by ensuring that the directory containing the ASP .NET service project has been imported into Enterprise Architect and, if required, the web folder containing the client web pages</p> <p>If your web project directory resides under the website hosting directory, you can import from the root and include both ASP code and web pages at the same time</p> <p>It is necessary to launch the client first, as the ASP .NET service process might not already be running; load the client using your browser - this ensures that the web server is running</p> <p>In the debug setup you must select the Attach to process radio button, and then type the keyword Attach in the script; this keyword causes the debugger to prompt you for a process at runtime</p> <p>Click on the Debug window Run button to start the debugger; the Attach To Process dialog displays</p> <p>The name of the process varies across Microsoft operating systems, as explained in the <i>ASP .NET SDK</i>; for example, under Windows Vista the name of the IIS process is <i>w3wp.exe</i></p> <p>On Windows XP, the name of the process resembles <i>aspnet_wp.exe</i>, although the name could reflect the version of the .NET framework that it is supporting</p> <p>There can be multiple ASP.NET processes running under XP; you must ensure that you attach to the correct version, which would be the one hosting the .NET framework version that your application runs on; check the <i>web.config</i> file for your web service to verify the version of .NET framework it is tied to</p> <p>The Debug window Stop button should be enabled and any breakpoints should be red, indicating they have been bound</p>	<p>Start and Stop Debugger^[1447]</p> <p>Breakpoint and Marker Management^[1436]</p>

You can set breakpoints at any time in the web server code. You can also set breakpoints in the ASP web page(s) if you imported them.

Notes:

- Some breakpoints might not have bound successfully, but if none at all are bound (indicated by being dark red with question marks) something has gone out of sync; try rebuilding and re-importing source code

11.2.6.2.5 The PHP Debugger

The Enterprise Architect PHP Debugger enables you to debug PHP.exe scripts. This section discusses basic setup and the various debugging scenarios that are commonly encountered; the scenarios concern themselves with the mapping of file paths, which is critical to the success of a remote debugging session.

- Script Setup
- Local Windows Machine (Apache Server)
- Local Windows Machine (PHP.exe)
- Remote Linux Machine (Apache Server)
- Remote Linux Machine (PHP.exe)

Topics:

Topic	Detail	See also															
Script Setup	<p>An Analyzer Script is a basic requirement for debugging in Enterprise Architect; you create a script using the toolbar of the Execution Analyzer</p> <p>Select PHPXDebug as the debugging platform; when you select this platform the property page displays the following connection settings:</p> <table border="1"> <thead> <tr> <th>Field</th> <th>Value</th> <th>Meaning</th> </tr> </thead> <tbody> <tr> <td>host</td> <td>localhost</td> <td>The adaptor that Enterprise Architect listens on for from PHP</td> </tr> <tr> <td>port</td> <td>9000</td> <td>The port that Enterprise Architect listens on for the</td> </tr> <tr> <td>localpath</td> <td>%LOCAL%</td> <td>Specifies the local file path to be mapped to a remote file path This is a remote debugging setting; for local debugging the value is a placeholder; you should edit it to fit the local file path</td> </tr> <tr> <td>remotepath</td> <td>%REMOTE%</td> <td>Specifies the remote file path that a local file path is mapped to This is a remote debugging setting; for local debugging the value is a placeholder; you should edit it to fit the remote file path</td> </tr> </tbody> </table>	Field	Value	Meaning	host	localhost	The adaptor that Enterprise Architect listens on for from PHP	port	9000	The port that Enterprise Architect listens on for the	localpath	%LOCAL%	Specifies the local file path to be mapped to a remote file path This is a remote debugging setting; for local debugging the value is a placeholder; you should edit it to fit the local file path	remotepath	%REMOTE%	Specifies the remote file path that a local file path is mapped to This is a remote debugging setting; for local debugging the value is a placeholder; you should edit it to fit the remote file path	
Field	Value	Meaning															
host	localhost	The adaptor that Enterprise Architect listens on for from PHP															
port	9000	The port that Enterprise Architect listens on for the															
localpath	%LOCAL%	Specifies the local file path to be mapped to a remote file path This is a remote debugging setting; for local debugging the value is a placeholder; you should edit it to fit the local file path															
remotepath	%REMOTE%	Specifies the remote file path that a local file path is mapped to This is a remote debugging setting; for local debugging the value is a placeholder; you should edit it to fit the remote file path															
Local Machine Apache Server	<p>In this situation, consider the following configuration:</p> <ul style="list-style-type: none"> • O/S: Windows7 • Network computer name: <i>MyPC</i> • Network share <i>MyShare</i> mapped to <i>c:\myshare</i> • Source files in Enterprise Architect have been imported from <i>c:\myshare\apache\myapp\scripts</i> • Apache document root is set to <i>//MyPC/MyShare/apache</i> <p>In this scenario an Analyzer Script for the connection parameters might be configured as follows:</p> <ul style="list-style-type: none"> • host: localhost • port: 9000 • localpath: <i>c:\myshare\apache\</i> • remotepath: <i>MyPC/MyShare/apache/</i> 																
Local Machine	<p>In this scenario an Analyzer Script for the connection parameters might be configured as follows, as file paths always map to same physical path:</p>

11.2.6.2.5.1 PHP Debugger - System Requirements

This topic identifies the system requirements and operating systems for the Enterprise Architect PHP debugger.

System Requirements:

- Enterprise Architect version 9

- PHP version 5.3 or above
- PHP zend extension XDebug 2.1 or above
- For web servers such as Apache, a server version that supports the PHP version

Supported Operating Systems:

- Client (Enterprise Architect)
 - Microsoft Windows XP and above
 - Linux running Crossover Office
- Server (PHP)
 - Microsoft Windows XP and above
 - Linux

11.2.6.2.5.2 PHP Debugger Checklist

This topic provides a supplementary checklist and troubleshooting guide for debugging PHP scripts in Enterprise Architect.

Topics:

Topic	Detail		See also
System Requirements	<ul style="list-style-type: none"> • Apache HTTP Web Server version 2.2 • PHP version 5.3 or above • XDebug version 2.1.1 		http://httpd.apache.org/ http://windows.php.net/ http://www.xdebug.org/download.php
Checklist	Enterprise Architect	<ul style="list-style-type: none"> • The model has an Analyzer Script configured to use the PHP-XDebug platform • PHP source code has been imported into the model (for recording and testpoints) • When the PHP-XDebug platform is selected from the Analyzer Script dialog, default runtime settings are listed in the Connection field <ul style="list-style-type: none"> • local path: %LOCAL% • remotepath: %REMOTE% <p>Either define local paths for these default variables or edit the script to provide actual paths</p> <p>For example: local source, remote source</p> <p><i>localpath:c:\code samples\vea\php\sample</i> <i>remotepath:web server/sample</i></p> <p>where:</p> <ul style="list-style-type: none"> • <i>web server</i> is a network or local share • <i>sample</i> is a folder below share 	
	PHP	<p>In order to debug PHP scripts in Enterprise Architect, it is a requirement that the PHP is configured properly to load the XDebug extension</p> <p>Settings similar to those below should be used:</p> <ul style="list-style-type: none"> • [xdebug] • xdebug.extended_info=1 	

Topic	Detail	See also
	<ul style="list-style-type: none"> xdebug.idekey=ea xdebug.remote_enable=1 xdebug.remote_handler=dbgp xdebug.remote_autostart=1 xdebug.remote_host=X.X.X.X xdebug.remote_port=9000 xdebug.show_local_vars=1 <p>The IP address X.X.X.X refers to and should match the host specified in the model Analyzer Script</p> <p>The IP address is the address XDebug connects with and the same address the Enterprise Architect PHP agent listens on</p>	
	<p>Apache</p> <p>For debugging using Apache, the following lines should be present in the Apache configuration file, <i>httpd.conf</i></p> <pre>LoadModule php5_module "php_home/ php5apache2_2.dll" AddHandler application/x-httpd-php . php PHPLibraryDir "php_home"</pre> <p>where <code>php_home</code> is the PHP installation path (the path where <code>php.ini</code> and <code>apache.dll</code> exist)</p>	
Troubleshooting	<p>To prevent both PHP and Apache timeouts during a debugging session, the settings below might require modification</p> <p>These settings were used while developing the PHP Debugging agent in Enterprise Architect</p>	
	<p>PHP</p> <p>File: php.ini</p> <pre>; EA prevent PHP timeouts when debugging PHP extensions max_execution_time = 0 ; EA prevent web server timeouts when debugging PHP extensions max_input_time = -1 ; EA log errors display_errors = On ; EA display startup errors display_startup_errors = On</pre>	
	<p>Apache</p> <p>File: httpd.conf</p> <pre>; EA prevent timeouts while debugging php extensions Timeout 60000</pre>	

11.2.6.3 Tracepoint Output

The Tracepoints page of the Analyzer Script enables you to direct where the output from any Trace statements goes during a debug session.

Field	Detail	See also
Output	<p>You can select from two options:</p> <ul style="list-style-type: none"> Screen (Default) - The output is directed to the Debugger 	

Field	Detail	See also
	Window <ul style="list-style-type: none"> • File - The output is directed to file 	
Folder	Enter the folder to use for Trace statement log files	
Filename	Enter the name to use for the Trace statement log files	
Overwrite	If selected, the specified file is overwritten each time a debug session is started	
Auto Number	If selected, the Trace log file is composed of the filename you specify and a number Each time you start a Debug session, the number is incremented	
Prefix trace output with function	If selected, any trace statements executed during the Debug session run are prefixed with the current function call	

11.2.6.4 Breakpoint and Marker Management

Breakpoints work in Enterprise Architect much like in any other debugger. Adding a breakpoint notifies the debugger to trap code execution at the point you have specified. When a breakpoint is encountered by a thread of the application being debugged, the source code is displayed in an editor window, and the line of code where the breakpoint occurred is highlighted.

Selecting a different package in the project affects which breakpoints are displayed. An Enterprise Architect model maintains breakpoints for every package having a *Build Script - Debug* command.

Access: [Analyzer | Breakpoints & Markers > Breakpoints & Markers](#)

The Breakpoint and Markers Toolbar:

Button	Description
	Enables all breakpoints
	Deletes all breakpoints
	Disables all breakpoints
	Limits any recording to specified relative stack depth
	Current breakpoint set. Default set is normally used for debugging and is personal. Other sets are shared between users of Model.
	Menu allowing management of breakpoint sets.
	Changes how breakpoints are grouped. You can select no grouping, group by file or group by class.

Breakpoint States:

DEBUGGER STATE			
	Running	Not running	See also
	Bound	Enabled	
	Disabled	Disabled	
	Not bound - this usually means that the DLL is not yet loaded or was not built with debug information	N/a	
	Failed - this usually means a break could not be set at this time	N/a	Failure to Bind Breakpoint ^[1439]

11.2.6.4.1 Breakpoint Properties

Breakpoints in Enterprise Architect support a number of additional properties that change when a breakpoint is hit, and determine what happens when it is hit.

Access: [Breakpoint Context Menu | Properties](#)

Use to:

- Change breakpoint actions.
- Move the breakpoint to another line.
- Add constraints to restrict when a breakpoint is hit.
- Add information to be logged when the breakpoint is hit.

Reference:

Field	Usage	See also
Action	Change the behavior when the breakpoint is hit	Marker Types ^[1642]
Line	Change the line that this breakpoint is on	
Constraints	Associate a condition with the breakpoint The program is allowed to run if the condition is not met when the breakpoint is encountered	
Log	Log information to the Debug Output window when the breakpoint is hit	

Specifying constraints:

You can compose constraints using any variables that are in scope at the time the breakpoint occurs. For example:

```
m_strName="John"
```

```
m_strName=""
```

```
m_nCount > 0
```

You can also join constraints using logical operands, for example:

```
m_strName="John" AND m_nCount > 0
```

You can access elements of an array or pointer, for example:

```
m_pNames[10]="John"
```

You can also nest constraints using parentheses to impose precedence, for example:

```
( x>0 AND y>0) OR (x < 0 AND y < 0)
```

11.2.6.4.2 Setting Code Breakpoints

Normal Breakpoints are typically set on a line of source code. When the Debugger hits the indicated line during normal execution, the Debugger halts execution and displays the local variables, call stack, threads and other run-time information.

How To:

To set a breakpoint on a line of code, follow the steps below:

Step	Action	See also
1	Open the source code to debug in the integrated source code editor;	
2	<p>Find the appropriate code line and click in the left margin column. A solid red circle in the margin indicates that a breakpoint has been set at that position.</p> <p>If the code is currently halted at a breakpoint, that point is indicated by a blue arrow next to the marker.</p>	

11.2.6.4.3 Setting Data Breakpoints

Data breakpoints enable the debugger to halt execution when the value of a pre-determined memory variable is changed. This can be useful when trying to track down the point at which a variable is modified during program execution, especially if it is not clear how program execution is affecting a particular object state.

Topics:

Topic	Detail	See also
Setting Data Breakpoints	<p>Data breakpoints can currently only be set by right-clicking on the variable in the Locals window and selecting the Break When Variable is Modified context menu option</p> <p>This means that in order to establish a data breakpoint you must first set a normal breakpoint at a point in the code that presents the required scope of local variables to choose from</p> <p>Once the program has halted execution, locate the variable of interest and select the Break When Variable is Modified context menu option</p>	<p>Viewing the value of local variables ^[1442]</p> <p>Breakpoint and Marker Management ^[1438]</p>

11.2.6.4.4 Failure to Bind BreakpointTopics:

Topic	Detail	See also
Breakpoint Failures	<p>A breakpoint failure occurs if there is a problem in binding the breakpoint</p> <p>A warning message displays in the Details column of the Breakpoints & Markers window, identifying the type of problem; for example:</p> <ul style="list-style-type: none"> • The source file for the breakpoint does not match the source file used to build the application image • The time date stamp on the file is greater than that of the image <p>A warning message is also output to the Debug Output window</p>	

11.2.6.4.5 Delete and Disable BreakpointsTopics:

Topic	Detail	See also
Delete, Disable and Enable Breakpoints	<p>To delete a specific breakpoint, either:</p> <ul style="list-style-type: none"> • If the breakpoint is enabled, click on the red breakpoint circle in the left margin of the Source Code Editor • Right-click on the breakpoint marker in the editor and select the appropriate context menu option, or • Select the breakpoint in the Breakpoints & Markers tab and press (Delete) <p>Whether you are viewing the Breakpoints folder or the Breakpoints & Markers window, you can right-click on an existing breakpoint and select a context menu option either to delete it or to convert it to a start recording marker or end recording marker</p>	<p>Marker Types ^[1642]</p>

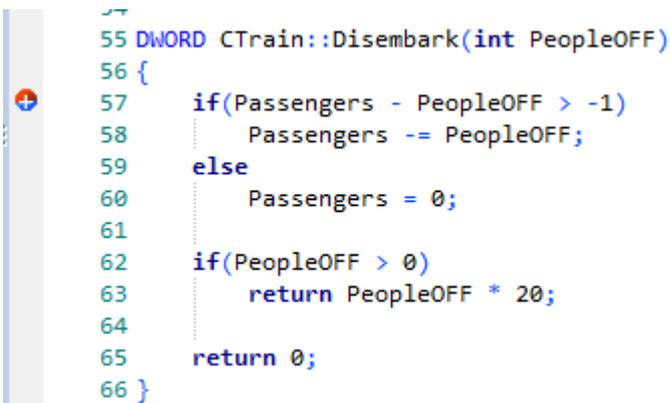

Topic	Detail	See also
	<p>You can also delete all breakpoints by clicking on the Delete all breakpoints button on the Breakpoints & Markers window toolbar</p> <p>()</p> <p>To disable a breakpoint, deselect its checkbox on the Breakpoints & Markers window or, to disable all breakpoints, click on the Disable all breakpoints button in the toolbar (); the breakpoint is then shown as an empty grey circle</p> <p>Select the checkbox or use the Enable all breakpoints button to enable it again ()</p>	

11.2.6.4.6 Trace Statements

Tracepoints are set in the code editor. Like breakpoints, they are placed on a line of code. When that line of code executes, the Execution Analyzer evaluates and prints the statement either to the Debugger output window or to file, if this has been configured in the Analyzer Script.

How to:

To set Tracepoints, follow the steps below:

Step	Action	See also
1	Open the source code to debug in the integrated source code editor	
2	Find the appropriate code line and right click in the left margin to bring up the Analyzer context menu Select the Add Tracepoint Marker option	
3	 <pre> 55 DWORD CTrain::Disembark(int PeopleOFF) 56 { 57 if(Passengers - PeopleOFF > -1) 58 Passengers -= PeopleOFF; 59 else 60 Passengers = 0; 61 62 if(PeopleOFF > 0) 63 return PeopleOFF * 20; 64 65 return 0; 66 } </pre>	
4	Right-click on the Tracepoint and choose the Properties context menu option	
5	In the Log field type the statement	

Specifying Tracepoints:

Using the example in the image above, we could output the number of people getting off a train by using the following statement:

```
There were @Passengers before @PeopleOFF got off the train
```

To print a variable, precede the variable name with the @ token. If a variable represents a string you should precede the variable with a \$ token.

11.2.6.4.7 How Markers are Stored

Topics:

Topic	Detail	See also
Storage	The Default always exists for a Model. It is a personal workspace and is not shared. It is stored externally. Marker Sets are stored in the model and are available to all users of the Model. They are shared,	

11.2.6.5 Debugging Actions

This section describes the actions you perform in running a debug session. It covers:

11.2.6.5.1 View the Call Stack

The Call Stack window is used to display all currently running threads in a process. It can be used to identify which thread is operational immediately before program failure occurs. A Stack trace is displayed whenever a thread is suspended, through one of the step actions or through encountering a **breakpoint**. The Call Stack can record a history of Stack changes along with the ability to generate Sequences Diagrams from this history.

Access: Analyzer | Call Stack

Use To:

- View Stack history to understand the execution of a process
- View Threads
- Save a Call Stack for later use
- Record Call Stack changes for Sequence Diagram generation

- Generate a Sequence Diagram from the Call Stack
- View the related code line in Source Code Editor

Topics:

Topic	Icon	Detail	See also
Indicators		<ul style="list-style-type: none"> • A green or yellow arrow highlights the current stack frame • A blue arrow indicates a thread that is running • A red arrow indicates a thread for which a stack trace history is being recorded 	
Actions		<p>Toolbar Actions:</p> <ul style="list-style-type: none"> • Save a Call Stack to file • Generate a Sequence diagram from the current Stack • Copy Stack to Recording history - adds the stack details to the Record History for Sequence Diagram generation • Toggle Stack Depth - show either the full Stack View or only frames with source • Double-clicking a thread/frame takes you to the related line of code in the Source Code Editor; local variables are also refreshed for the selected frame <p>Right-click on an items in the Stack list and select context menu options to:</p> <ul style="list-style-type: none"> • Record Stack changes • Auto-Record • Stop the Recording • Generate a Sequence Diagram of the Stack • Copy Stack to Record History

Learn More:

- [Breakpoint and Marker Management](#)^[1436]

11.2.6.5.2 View the Local Variables

Whenever a thread encounters a breakpoint, this window displays all the local variables for the thread at its current stack frame.

The value and the type of any in-scope variables are displayed in a tree. Local variables are displayed with colored box icons with the following meanings:

Color	Meaning
Blue	Object with members

Color	Meaning
Green	Arrays
Pink	Elemental types
Yellow	Parameters
Red	Workbench Instance

11.2.6.5.3 View Content Of Long Strings**Topics:**

Topic	Detail	See also
Debugging Actions - View Entire Content Of Long Strings	For efficiency, the Locals window only shows partial strings; the size of any variable value displayed in the window can be up to 256 characters To view the entire value of a variable, right-click on it and select the View in Editor context menu option; the String Viewer dialog displays	

11.2.6.5.4 View Elements of Array**Access: Analyzer | Watches**

It is not always possible to evaluate the content of large data structures or arrays using the local variables display. To inspect one or more elements of an array you can use the Watches window. In the toolbar edit box you type the name of the variable followed by the start element and the number of elements to display. The start element is enclosed in square brackets and the count of elements is enclosed in parentheses, as follows:

```
variable[ start_element ] ( count_of_elements )
```

m_pStrings[0](10)	Displays ten elements of string array starting at element zero.	char* m_pStrings;
m_Numbers[100]	Displays the 100th element of integer array m_Numbers	int m_Numbers[200]

11.2.6.5.5 View Variables in Other Scopes

Topics:

Topic	Detail	See also
Watches	<p>The Watches window is most useful for native code (C, C++, VB) where it can be used to evaluate data items that are not available as Local Variables - data items with module or file scope and static Class member items</p> <p>You can also use the window to evaluate static Class member items in Java and .NET</p> <p>To use the Watches window, type the name of the variable to examine in the field in the window toolbar, and either press (Enter) or click on the Add new watched item icon</p> <p>To examine a static Class member variable in C++, Java or Microsoft .NET, enter its fully qualified name; for example:</p> <pre>CMyCl ass : : MySt at i cVar</pre> <p>To examine a C++ data symbol with module or file scope, just enter its name</p> <p>Variables are evaluated by looking at the current scope; that is, the module of the current stack frame (you can change the scope at a breakpoint by double-clicking the frame in the call stack)</p> <p>If the global variable exists in a different module, you can examine the variable by prefixing the module name to the variable; for example:</p> <pre>modul ename! var i abl e_ name</pre> <p>The names of the items to evaluate persist for the package and user ID, so the next time <i>you</i> debug the same project, the items evaluate automatically whenever a breakpoint occurs; they do not appear if another user debugs the same code</p> <p>If necessary, you can delete items using the Delete all watched items icon in the toolbar, or the right-click context menu option inside the window</p>	<p>View the Local Variables ^[1444]</p>

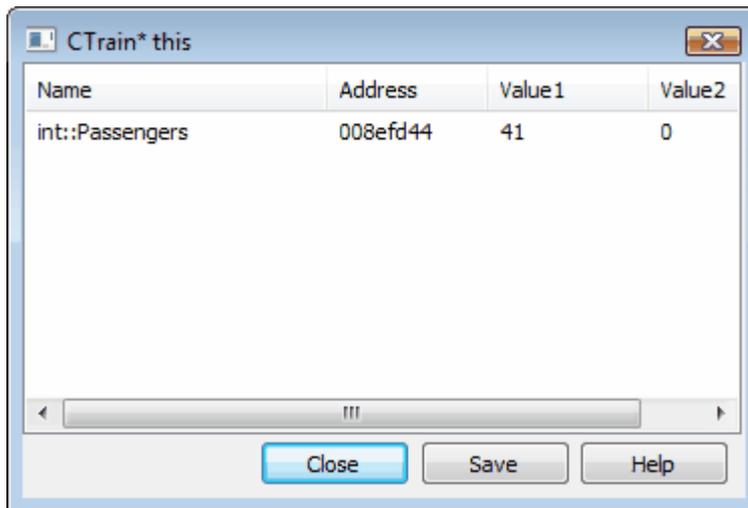

11.2.6.5.6 Variable Snapshots

Snapshots allow you to compare the value of an object at one point in time with its value at a later point in time. You can take a snapshot of a variable when the program is at a breakpoint. The debugger copies the values of not only the selected variable but any of its members and and so on until it can find no debug information for a member or no more members can be found.

The procedure for using variable snapshots is typically as follows:

1. Set two breakpoints (called **start** and **end**) The start is usually placed at the start of a function and the end breakpoint at the end of the function.
2. At the **start** breakpoint select a variable in the Locals window and select the **Save Variable Snapshot** context menu option.
3. Run the program.
4. When the **end** breakpoint is reached, select the **Compare Variable Snapshots** context menu option; a dialog displays that details the original value from the first snapshot and the current value from the second snapshot (see the example below).

The following image shows the comparison between values of a variable, captured using this feature. (This is taken from the *EA.Example* model.)

11.2.6.5.7 Inspect Process Memory

Access: [Analyzer](#) | [More Analyzer Windows](#) | [Memory Viewer](#)

Topics:

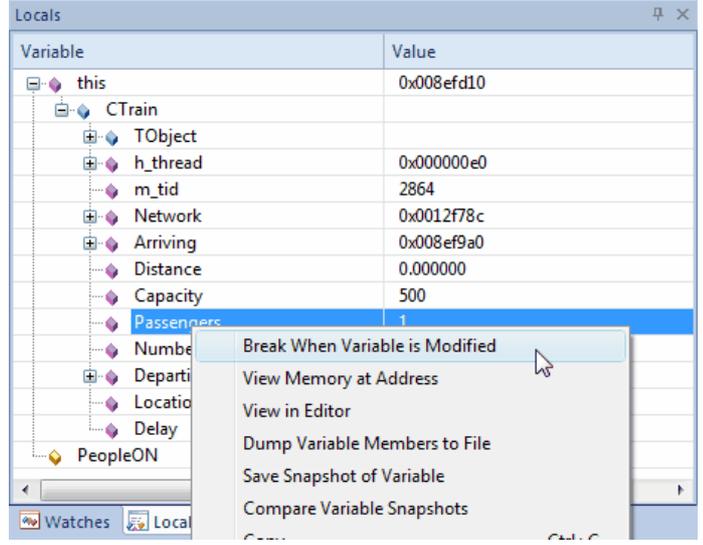

Topic	Detail	See also
Memory Viewer	<p>You can display the raw values at a memory address or for a variable in a window using the Memory Viewer - select the View Memory at Address context menu option</p> <p>The Memory Viewer displays the raw values at a memory address</p> <p>The Memory Viewer is available for debugging Microsoft Native Code Applications (C, C++, VB) running on Windows or within WINE on Linux</p>	

11.2.6.5.8 Break When a Variable Changes Value

You can set a breakpoint on a variable such that when it is modified the debugger halts at the line of code that has just caused the memory to be changed. When such a breakpoint occurs the code editor is displayed and the line highlighted. The log in the Debugger window also prints a statement to the effect.

Topics:

Topic	Detail	See also
Usage	<p>An invalid or uninitialised variable can cause the program behaviour to differ from expected. This tool enables you to halt execution whenever a certain variable has its value changed.</p> <p>The example below creates a notification on a variable from the Locals window. The item being watched is the Passengers integer member of the CTrain class.</p>	

Topic	Detail	See also
		

Notes:

- This feature is not presently supported by the Microsoft .NET platform.

11.2.6.5.9 Show Loaded Modules

The debugger **Modules** window lists the modules loaded by the process being debugged.

The columns on this window are described below:

Column	Action
Path	Determine the file path of the loaded module.
Modified Date	Determine the local file date and time the module was modified.
Debug Symbols	Establish the debug symbols type, whether debug information is present in the module and whether line information is present for the module (required for debugging).
Symbol File Match	Check the validity of the symbol file; if the value is false, the symbol file is out of date.
Symbol Path	Determine the file path of the symbol file, which must be present for debugging to work.
Modified Date	Determine the local file date and time the symbol file was created.

11.2.6.5.10 Show Output from Debugger**Topics:**

Topic	Detail	See also
Usage	During a debug session the Debugger emits messages	

Topic	Detail	See also
	<p>detailing both startup and termination of session, to its Output tab. Details of exceptions and any errors are also output to this tab. Any trace messages such as those output using <i>Java System.out</i> or <i>.NET System.Diagnostics.Debug</i> are also captured and displayed here.</p> <p>If you double-click on a debug message, either:</p> <ul style="list-style-type: none"> • A pop-up displays with more complete message text, or • If there has been a memory leak, the file is displayed at the point at which the error occurred 	

11.2.6.5.11 Debug Tooltips in Code Editors

Topics:

Topic	Detail	See also
Inspecting Member Variables	<p>During debugging, whenever a thread is suspended at a line of execution, you can inspect member variables in the Editor window.</p> <p>To evaluate a member variable, use the mouse to move the cursor over the variable in the Editor window, as shown in the following examples.</p> <pre> public void Print() { int n = 0; while (names[n].Length > 0) { names = { [4] names[0]=book, names[0]=book, names[1]=novel, names[2]=film, ... } Document d = new Document (names[n++]); d.Print(); } } public void Print() { int n = 0; while (32-bit signed integer n=0 0) { Document d = new Document (names[n++]); d.Print(); } } </pre>	

11.2.6.5.12 Start & Stop Debugger

Topics:

Topic	Detail	See also
Usage	<p>If Basic Setup has been completed, pressing (F6) starts the application using the configured Debugger.</p> <p>If not, debugging is still possible by using the Attach button on either one of the Debugger toolbars.</p> <p>To stop debugging, click on the Stop button  in the Debug</p>	Setup ^[1392]

Topic	Detail	See also
	window toolbar, or press (Ctrl+Alt+F6) .	

Notes:

- In most situations, the debugger ends:
 - when it encounters breakpoints (which should be set beforehand)
 - when the debug process terminates
 - when the Java Class thread exits
- However, due to the nature of the Java Virtual Machine, it is necessary at times for Java developers to stop the debugger manually with the **Stop** button

11.2.6.5.13 Debug Another Process**Topics:**

Topic	Detail	See also
Usage	<p>When debugging another process, the Attach To Process dialog is displayed.</p> <p>You can limit the processes displayed using the radio buttons at the top of the dialog. To find a service such as Apache Tomcat or ASP.NET, select the System radio button.</p> <p>You must choose the debugger when you select a process. However, if the selected Package has already been configured for debugging then the Debugger listed is the one specified in the Script.</p> <p>Once Enterprise Architect is attached to the process, any breakpoints encountered are detected by the debugger and the information is available in the Debugger windows.</p> <p>To detach from a process, click on the Debug Stop button.</p>	

11.2.6.5.14 Step Over Lines of Code**Topics:**

Topic	Detail	See also
Stepping Over	<p>You can step over the lines of a function using the Debug toolbar buttons.</p> <p>When you step to the end of the function, you step back to the caller.</p>  <p>Alternatively, press (Alt+F6) or select the Analyzer Debug Step Over context menu option.</p>	

11.2.6.5.15 Step Into Function Calls

Topics:

Topic	Detail	See also
Stepping In	<p>The <i>Step In</i> function is executed by clicking on the Step In button.</p>  <p>Alternatively, press (Shift+F6) or select the Analyzer Debug Step In context menu option.</p> <p>If no source is available for the function then the debugger continues stepping until it either enters a new function or reaches the next line of the current one.</p>	

11.2.6.5.16 Step Out of Functions

Topics:

Topic	Detail	See also
Stepping In	<p>The <i>Step Out</i> function is executed by clicking on the Step Out button.</p>  <p>Alternatively, press (Ctrl+F6) or select the Analyzer Debug Step Out menu option.</p> <p>If no source is available for the function then the debugger continues stepping until it either enters a new function or reaches the next line of the current one.</p>	

11.2.6.6 Recording Actions

This section describes how to perform the following debug recording actions:

- [Step through function calls](#) ^[1449]
- [Create a Sequence diagram of the Call Stack](#) ^[1450]
- [Save the Call Stack](#) ^[1450]

11.2.6.6.1 Step Through Function Calls

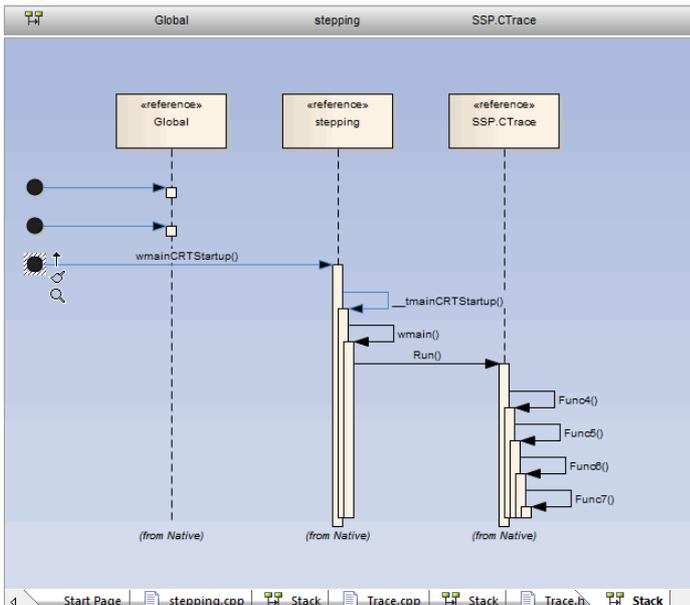

Topics:

Topic	Detail	See also
Stepping Through	<p>The Step Through function can be executed by clicking on the Step Through button on the Record & Analyze window toolbar</p>  <p>Alternatively, press (Shift+F6) or select the Analyzer Debug Step Into context menu option</p> <p>The <i>Step Through</i> command causes a <i>Step Into</i> command to</p>	

Topic	Detail	See also
	<p>be executed. If any function is detected, then that function call is recorded in the History window. The debugger then steps out, and the process can be repeated.</p> <p>This button enables you to record a call without having to actually step into a function. The button is only enabled when at a breakpoint and in manual recording mode.</p>	

11.2.6.6.2 Create Sequence Diagram of Call Stack

Topics:

Topic	Detail	See also
Usage	<p>To generate a Sequence diagram from the current Stack, click on the Generate Sequence Diagram of Stack button on the Call Stack window toolbar.</p> <p>This immediately generates a Sequence diagram in the Diagram View.</p> 	

11.2.6.6.3 Saving the Call Stack

On the **Call Stack** window, you can save the current Stack to file or copy the Stack to the recording history.

Toolbar:

Icon	Detail	See also
	Save Stack to file	
	Copy Stack to recording history	

11.2.7 Run

This section describes how to create a **command for running** your executable code.

Learn More:

- [Add run command](#)^[1451]

11.2.7.1 Add Run Command

This topic explains how you enter a command for running your executable.

Topics:

Topic	Detail	See also
Usage	This is the command that is executed when you select the Analyzer Run menu option. At its simplest, the script would contain the location and name of the file to be run.	
Example	<p>The following two examples show scripts configured to run a .Net and a Java application in Enterprise Architect.</p> <p>.Net:</p> <pre>C: \ benchmark \ cpp \ example_net_1 \ release \ example.exe</pre> <p>Java:</p> <pre>customer</pre> <p>The command listed in this field is executed as if from the command prompt. As a result, if the executable path or any arguments contain spaces, they must be surrounded in quotes.</p>	

Notes:

- Enterprise Architect provides the ability to start your application normally OR with debugging from the same script. The **Execution Analyzer** menu has separate options for starting a normal run and a debug run

11.2.8 Testing

This section describes how to create a **command for performing unit testing** on your code.

Learn More:

- [Add Testing Command](#)^[1451]

11.2.8.1 Add Testing Command

This topic explains how to configure the Test Page of an Analyzer Script to performing unit testing on your code.

Topics:

Topic	Detail	See also
Usage	<p>A sample script would contain a line to execute the testing tool of your choice, with the filename of the executable produced by the Build command as the option. To execute this test select the Analyzer Test Run Test Script menu option.</p> <p>Testing could be integrated with any test tool using the command line provided, but in these examples you can see how to integrate <i>NUnit</i> and <i>JUnit</i> testing with your source code. Enterprise Architect provides an inbuilt MDA Transform from source to Test Case, plus the ability to capture <i>xUnit</i> output and use it to go directly to a test failure. <i>xUnit</i> integration with your model is now a powerful means of delivering solid and well-tested code as part of the complete model-build-test-execute-deploy life-cycle.</p> <p>NUnit and JUnit must be downloaded and installed prior to their use. Enterprise Architect does not include these products in the base installer.</p>	
Execute Command As:	<p>Process</p> <p>Enter path to a program or batch file to run followed by any parameters.</p> <p>Batch File</p> <p>When using this option, you can enter multiple commands. These commands are then executed as a single script in a command console. You have access to any environment variables available in a standard command console.</p>	
Parse Output	<p>Selecting an Output Parser causes output from the command(s) to be captured to the Output window. The Output Parser field specifies the syntax to be expected. Double-clicking on a result in the Output window opens the corresponding code segment in Enterprise Architect's code window.</p> <p>Selecting the Build First checkbox ensures that the package is recompiled each time you run the test.</p> <p>If you include the string %N in your test script it is replaced by the fully namespace-qualified name of the currently selected Class when the script is executed.</p>	
Example	<p>NUnit</p> <pre>" C: \ Pr o g r a m F i l e s \ N U n i t \ b i n \ n u n i t - c o n s o l e . e x e " p i n \ d e b u g \ C a l c u l a t o r . e x e "</pre> <p>JUnit</p> <pre>j a v a j u n i t . t e x t u i . T e s t r u n n e r %N</pre> <p>The command listed in this field is executed as if from the command prompt. As a result, if the executable path or any arguments contain spaces, they must be surrounded in quotes.</p>	

11.2.8.2 Testpoints Output

The Testpoints page of the Analyzer Script allows you to configure the output of a Testpoint run.

Topic	Detail	See also
Output	You can select from two options: <ul style="list-style-type: none"> • Screen (Default) - The output is directed to the Testpoints tab of the System Output window • File - The output is directed to file 	Testpoint Management ^[1672]
Folder	Enter the folder to use for Testpoint log files.	
Filename	Enter the name to use for the Testpoints log files	
Overwrite	When Overwrite is selected, the file specified is overwritten each time a Testpoint run is performed.	
Auto Number	When this option is selected, the Testpoint output is composed of the filename you specify and the number of the Test run. Each time you perform a Test run the number is incremented.	
Prefix trace output with function	When this option is selected, any trace statements executed during the Testpoint run are prefixed with the current function call.	

11.2.9 Deploying

This section describes how to create a **command for deploying** the current package.

Learn More:

- [Add Deploy Command](#)^[1453]

11.2.9.1 Add Deploy Command

This topic explains how to configure the Deploy Page of an Analyzer Script to deploy your project.

Topics:

Topic	Detail	See also
Usage	This topic enables you to create a command for deploying a package. This script is executed when you select the Analyzer Deploy or by pressing Ctrl + Shift + Alt + F12	
Execute Command as:	Process If the deployment is handled externally, enter the path to the program or batch file to run followed by any parameters. This program is launched in a separate process. Example: C:\apache-ant-1.7.1\bin\ant.cmd myproject deploy	

Topic	Detail	See also
	<p>Batch File</p> <p>When using this option, you can enter multiple commands. These commands are then executed as a single script in a command console. You have access to any environment variables available in a standard command console.</p> <p>Example:</p> <pre>@echo on IF NOT EXIST "%1%" GOTO DEPLOY_NOWAR IF "%APACHE_HOME%" == "" GOTO DEPLOY_NOAPACHE xcopy /L "%1%" "%APACHE_HOME%\webapps" GOTO DEPLOY_END rem rem NO WAR FILE rem :DEPLOY_NOWAR echo "%1% WAR file not found" GOTO DEPLOY_END rem rem NO APACHE ENVIRONMENT VARIABLE rem :DEPLOY_NOAPACHE echo "APACHE_HOME environment variable not found" :DEPLOY_END pause</pre>	
Parse Output	<p>Selecting a Parser from the list causes output of the deploy script to be captured. The output is parsed according to the syntax selected from the list.</p> <p>The output window can be displayed by selecting View System Output</p>	

11.2.10 Searching Files

This topic describes how to use the File Search facility to search files for data names and structures.

Learn More:

- [Find in Files](#) ^[1454]

11.2.10.1 Find in Files

This topic describes the **File Search** control.

Topics:

Topic	Detail	See also
Usage	<p>File Text Searches are provided by the Search Window and from within the Code Editors.</p> <p>The Search window enables you to search for text in code files and scripts. You can select to display the results of the search in one of two formats:</p> <ul style="list-style-type: none"> • List View - each result line consists of the file path and line number, followed by the line text; multiple lines from one file are listed as separate entries 	

Topic	Detail	See also
	<ul style="list-style-type: none"> • Tree View - each result line consists of the file path that matches the search criteria, and the number of lines matching the search text within that file; you can expand the entry to show the line number and text of each line 	

Search Toolbar:

You can use the toolbar options in the **Search** window to control the search operation. The state of all buttons persists over time to always reflect your previous search criteria.

The options, from left to right, are as follows:

Reference:

Field	Usage	See also
Search Path list box	<p>Specify the folder to search.</p> <p>You can type the path to search directly into the text box, or click on the folder icon to browse for the path. Any paths you enter are automatically saved in the drop-down list, up to a maximum of ten; paths added after that overwrite the oldest path in the list.</p> <p>A fixed option in the drop-down list is Search in Scripts, which sets the search to operate on all local and user-defined scripts in the Scripts tab of the Scripting window. This option disables the Search File Types list box.</p>	
Search Text list box	<p>Specify the text to look for.</p> <p>You can type the text directly into the text box or click on the drop-down arrow to select from a previous entry in the list. The search text you enter is automatically saved in the list when you click on the Search button.</p> <p>The list box saves up to ten search queries. Search queries added after that overwrite the oldest query in the list.</p>	
Search File Types list box	<p>Limit the search to specific types of files. You can select multiple file types in a string, separated by either a comma or a semi-colon as shown in the image above.</p>	
Search button	<p>Begin the search.</p> <p>During the course of the search all other buttons in the toolbar are disabled. You can cancel the search at any time by clicking on the Search button again.</p> <p>If you switch any of the toggle buttons below, you must run the search again to change the output.</p>	
Case Sensitivity button	<p>Toggle the case sensitivity of the search. The tooltip message identifies the current status of the button.</p>	
Word Match button	<p>Toggle between searching for any match and searching for only</p>	

Field	Usage	See also
	those matches that form an entire word. The tooltip message identifies the current status of the button.	
SubFolders button	Toggle between limiting the search to a single path and including all subfolders under that path. The tooltip message identifies the current status of the button.	
Result View button	Select the presentation format of the search results - List View or Tree View format.	
Clear Results button	Clear the results.	
Clear Search Criteria button	Remove all the entries in the Search Path , Search Text and Search File Types list boxes, if required.	
Help button	Display this Help topic.	

11.3 Modeling Conventions

In order to get the most out of the round trip engineering in Enterprise Architect, you must be familiar with the modeling conventions used when generating and reverse engineering the languages you use. This topic describes the stereotypes, Tagged Values and other conventions used in code engineering in Enterprise Architect for the following supported languages:

Topic	Link
Action Script	ActionScript ^[1458]
Ada 2005 (Systems Engineering and Ultimate editions)	Ada 2005 ^[1459]
C	C ^[1461]
C#	C# ^[1463]
C++	C++ ^[1465]
Delphi	Delphi ^[1469]
Java	Java ^[1470]
PHP	PHP ^[1472]
Python	Python ^[1473]
SystemC(Systems Engineering and Ultimate editions)	SystemC ^[1474]
Verilog (Systems Engineering and Ultimate editions)	Verilog ^[1477]
VHDL(Systems Engineering and Ultimate editions)	VHDL ^[1478]
Visual Basic	Visual Basic ^[1480]
Visual Basic .NET	Visual Basic .NET ^[1475]

Notes:

- Enterprise Architect incorporates a number of visibility indicators or scope values for its supported languages. These include, for:
 - All languages - Public (+), Protected (#) and Private (-)
 - Java - Package (~)
 - Delphi - Published (^)
 - C# - Internal (~), Protected Internal (^)
 - ActionScript - Internal (~)
 - VB.NET - Friend (~), Protected Friend (^)
 - PHP - Package (~)
 - Python - Package (~)
 - C - Package (~)
 - C++ - Package (~)

11.3.1 ActionScript Conventions

Enterprise Architect supports round trip engineering of ActionScript 2 and 3, where the following conventions are used.

Stereotypes

Reference:

Stereotype	Applies To	Corresponds To
literal	Operation	A literal method referred to by a variable.
property get	Operation	A read property.
property set	Operation	A write property.

Tagged Values

Reference:

Tag	Applies To	Corresponds To
attribute_name	Operation with stereotype <i>property get</i> or <i>property set</i>	The name of the variable behind this property.
dynamic	Class or Interface	The <i>dynamic</i> keyword.
final	ActionScript 3: Operation	The <i>final</i> keyword.
intrinsic	ActionScript 2: Class	The <i>intrinsic</i> keyword
namespace	ActionScript 3: Class, Interface, Attribute, Operation	The namespace of the current element.
override	ActionScript 3: Operation	The <i>override</i> keyword.
prototype	ActionScript 3: Attribute	The <i>prototype</i> keyword.
rest	ActionScript 3: Parameter	The <i>rest</i> parameter (...).

Topics:

Topic	Detail	See also
Common Conventions	<ul style="list-style-type: none"> Package qualifiers (ActionScript 2) and Packages (ActionScript 3) are generated when the current package is not a namespace root An unspecified type is modeled as <i>var</i> or an empty Type field 	Namespace <small>s_[1495]</small>
ActionScript 3 Conventions	<ul style="list-style-type: none"> The <i>Is Leaf</i> property of a Class corresponds to the sealed keyword If a <i>namespace</i> tag is specified it overrides the <i>Scope</i> that is specified 	

Learn More:

- [Import Source Code](#)^[1510]
- [Generate Source Code](#)^[1490]
- [ActionScript Options](#)^[1530]

11.3.2 Ada 2005

Ada 2005 support is available in the System Engineering and Ultimate editions of Enterprise Architect.

Enterprise Architect supports round trip engineering of Ada 2005, where the following conventions are used.

Stereotypes

Reference:

Stereotype	Applies To	Corresponds To
adaPackage	Class	A package specification in Ada 2005 without a tagged record.
adaProcedure	Class	A procedure specification in Ada 2005.
delegate	Operation	Access to a subprogram.
enumeration	Inner Class	An <i>enum</i> type.
struct	Inner Class	A record definition.
typedef	Inner Class	A type definition, subtype definition, access type definition, renaming.

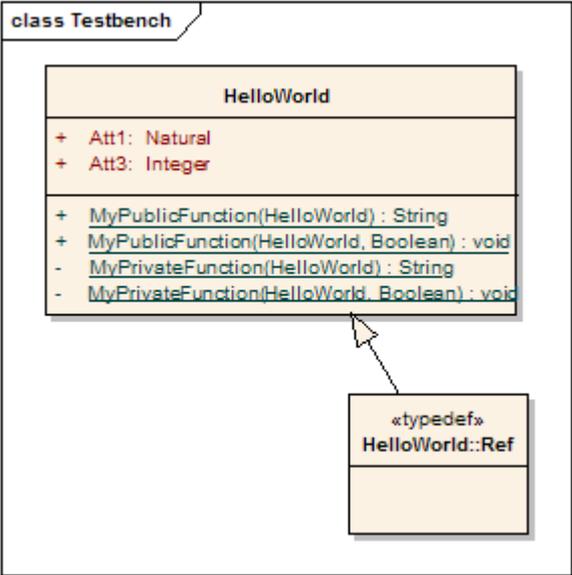

Tagged Values

Reference:

Tag	Applies To	Corresponds To
Discriminant	Inner Class with stereotype <i>typedef</i>	The type's discriminant.
IsAccess	Parameter	Determination of whether the parameter is an access variable.
InstantiatedUnitType	Inner Class with stereotype <i>typedef</i>	The instantiated unit's type (<i>Package / Procedure / Function</i>).
PartType	Inner Class with stereotype <i>typedef</i>	The part type (<i>renames</i> or <i>new</i>).
Type	Inner Class with stereotype <i>typedef</i>	If Value = <i>Sub Type</i> , set subtype. If Value = <i>Access</i> , set access type.

Topics:

Topic	Detail	See also
Other	<ul style="list-style-type: none"> • Appropriate type of source files: Ada specification file, .ads. 	Ada 2005 options

Topic	Detail	See also
Conventions	<ul style="list-style-type: none"> • Ada 2005 imports packages defined as either <<adaPackage>>Class or Class, based on the settings in the Ada 2005 options • A package in the Ada specification file is imported as a Class if it contains a Tagged Record, the name of which is governed by the options Use Class Name for Tagged Record and Alternate Tagged Record Name. All attributes defined in that Tagged Record are absorbed as the Class's attributes • A procedure / function in an Ada specification file is considered as the Class's member function if its first parameter satisfies the conditions specified in the options Ref Param Style, Ignore Reference parameter name and Ref parameter name • The option Define Reference for Tagged Record, if enabled, creates a reference type for the Class, the name of which is determined by the option Reference Type Name <p>For example: HelloWorld.ads</p> <pre> package HelloWorld is type HelloWorld is tagged record Att1: Natural; Att3: Integer; end record; -- Public Functions function MyPublicFunction (P: HelloWorld) return String; procedure MyPublicFunction (P1: in out HelloWorld; AFlag: Boolean); private -- Private Functions function MyPrivateFunction (P: HelloWorld) return String; procedure MyPrivateFunction (P1: in out HelloWorld; AFlag: Boolean); end HelloWorld; </pre>  <pre> classDiagram class HelloWorld { +Att1: Natural +Att3: Integer +MyPublicFunction(HelloWorld): String +MyPublicFunction(HelloWorld, Boolean): void -MyPrivateFunction(HelloWorld): String -MyPrivateFunction(HelloWorld, Boolean): void } class HelloWorldRef { «typedef» } HelloWorldRef --> HelloWorld </pre>	1537

11.3.3 C Conventions

Enterprise Architect supports round trip engineering of C, where the following conventions are used:

Stereotype:

Stereotype	Applies To	Corresponds To
enumeration	Inner Class	An <i>enum</i> type
struct	Inner Class	A <i>struct</i> type
	Attribute	A keyword <i>struct</i> in variable definition
typedef	Inner Class	A <i>typedef</i> statement, where the parent is the original type name
union	Inner Class	A <i>union</i> type
	Attribute	A keyword <i>union</i> in variable definition

Tagged Values:

Tag	Applies To	Corresponds To
anonymous	Class also containing the Tagged Value <i>typedef</i>	The name of this class being defined only by the <i>typedef</i> statement
bodyLocation	Operation	The location the method body is generated to; expected values are header , classDec or classBody
typedef	Class with stereotype other than <i>typedef</i>	This Class being defined in a <i>typedef</i> statement

C Code Generation for UML Model:

UML	C Code	Notes
A Class	A pair of C files (.h + .c)	File name is the same as Class name
Operation (public & protected)	Function declaration in .h file and definition in .c file	
Operation (private)	Function definition in .c file only	
Attribute (public & protected)	Variable definition in .h file	
Attribute (private)	Variable definition in .c file	

UML	C Code	Notes
Inner Class (without stereotype)	(N/A)	This inner Class would be ignored

Topics:

Topic	Detail	See also
Capture #define value to be generated in C code	<p>For example, <code>#define PI 3.14</code></p> <ol style="list-style-type: none"> 1. Add an attribute to the Class, with Name = PI and Initial Value = 3.14 2. In the General page of the Attribute Properties dialog, select the Static and Const checkboxes 3. On the Tagged Values page of the Attribute Properties dialog, add a tag called define with the value true 	Attributes ^[695] Attributes Dialog - General ^[696] Attribute Tagged Values ^[699]

Notes:

- Separate conventions apply to **Object Oriented programming in C**

11.3.3.1 Object Oriented Programming In C

The following conventions are used for Object-Oriented programming in C.

To configure Enterprise Architect to support Object-Oriented programming using C, you must set the **Object Oriented Support** option to **True** on the C Specifications page of the Options dialog.

Stereotype

Stereotype	Applies To	Corresponds To
enumeration	Class	An <i>enum</i> type
struct	Class	A <i>struct</i> type
	Attribute	A keyword <i>struct</i> in variable definition
typedef	Class	A <i>typedef</i> s statement, where the parent is the original type name
union	Class	A <i>union</i> type
	Attribute	A keyword <i>union</i> in variable definition

Tagged Values

Tag	Applies To	Corresponds To
anonymous	Class with stereotype of <i>enumeration, struct</i> or <i>union</i>	The name of this Class being defined only by the <i>typedef</i> statement
bodyLocation	Operation	The location the method body is generated to. Expected values are header , classDec or classBody
define	Attribute	<i>#define</i> statement
typedef	Class with stereotype of <i>enumeration, struct</i> or <i>union</i>	This Class being defined in a <i>typedef</i> statement

Topics:

Topic	Detail	See also
Object-Oriented C Code Generation for UML Model	<p>The basic idea of implementing a UML Class in C code is to group the data variable (UML attributes) into a structure type; this structure is defined in a .h file so that it can be shared by other classes and by the client that referred to it</p> <p>An operation in a UML Class is implemented in C code as a function; the name of the function must be a fully qualified name that consists of the operation name, as well as the Class name to indicate that the operation is for that Class</p> <p>A delimiter (specified in the Namespace Delimiter option on the C Specifications page) is used to join the Class name and function (operation) name</p> <p>The function in C code must also have a reference parameter to the Class object - you can modify the Reference as Operation Parameter, Reference Parameter Style and Reference Parameter Name options on the C Specifications page to support this reference parameter</p>	<p>C Specification <small>[1531]</small></p>
Limitations of Object-Oriented Programming in C	<ul style="list-style-type: none"> • No scope mapping for an attribute: an attribute in a UML Class is mapped to a structure variable in C code, and its scope (private, protected or public) is ignored • Currently an inner Class is ignored: if a UML Class is the inner Class of another UML Class, it is ignored when generating C code • Initial value is ignored: the initial value of an attribute in a UML Class is ignored in generated C code

11.3.4 C# Conventions

Enterprise Architect supports the round trip engineering of C#, where the following conventions are used.

Stereotypes

Reference:

Stereotype	Applies To	Corresponds To
enumeration	Class	An <i>enum</i> type.
event	Operation	An event.
extension	Operation	A Class extension method, represented in code by a <i>this</i> parameter in the signature.
indexer	Operation	A property acting as an index for this Class.
partial	Operation	The <i>partial</i> keyword on an operation.
property	Operation	A property possibly containing both read and write code.
struct	Class	A <i>struct</i> type.

Tagged Values

Reference:

Tag	Applies To	Corresponds To
argumentName	Operation with stereotype <i>extension</i>	The name given to the <i>this</i> parameter.
attributeName	Operation with stereotype <i>property</i> or <i>event</i>	The name of the variable behind this property or event.
className	Operation with stereotype <i>extension</i>	The Class that this method is being added to.
const	Attribute	The <i>const</i> keyword.
definition	Operation with stereotype <i>partial</i>	Whether this is the declaration of the method, or the definition.
delegate	Operation	The <i>delegate</i> keyword.
enumType	Operation with stereotype <i>property</i>	The datatype that the property is represented as.
extern	Operation	The <i>extern</i> keyword.
fixed	Attribute	The <i>fixed</i> keyword.
generic	Operation	The generic parameters for this Operation.
genericConstraints	Templated Class or Interface, Operation with tag <i>generic</i>	The constraints on the generic parameters of this type or operation.
Implements	Operation	The name of the method this implements, including the interface name.
ImplementsExplicit	Operation	The presence of the source interface name in this method declaration.
initializer	Operation	A constructor initialization list.

Tag	Applies To	Corresponds To
new	Class, Interface, Operation	The <i>new</i> keyword.
override	Operation	The <i>override</i> keyword.
params	Parameter	A parameter list using the <i>params</i> keyword.
partial	Class, Interface	The <i>partial</i> keyword.
readonly	Operation with stereotype <i>property</i>	This property only defining read code.
sealed	Operation	The <i>sealed</i> keyword.
static	Class	The <i>static</i> keyword.
unsafe	Class, Interface, Operation	The <i>unsafe</i> keyword.
virtual	Operation	The <i>virtual</i> keyword.
writable	Operation with stereotype <i>property</i>	This property only defining write code.

Topics:

Topic	Detail	See also
Other Conventions	<ul style="list-style-type: none"> Namespaces are generated for each package below a namespace root The <i>Const</i> property of an attribute corresponds to the <i>readonly</i> keyword, while the tag <i>const</i> corresponds to the <i>const</i> keyword The value of <i>inout</i> for the <i>Kind</i> property of a parameter corresponds to the <i>ref</i> keyword The value of <i>out</i> for the <i>Kind</i> property of a parameter corresponds to the <i>out</i> keyword Partial Classes can be modeled as two separate Classes with the <i>partial</i> tag The <i>Is Leaf</i> property of a Class corresponds to the <i>sealed</i> keyword 	Namespaces ^[1495]

11.3.5 C++ Conventions

Enterprise Architect supports round trip engineering of C++, including the **Managed C++** and **C++/CLI** extensions, where the following conventions are used.

Stereotypes

Reference:

Stereotype	Applies To	Corresponds To
enumeration	Class	An <i>enum</i> type.
friend	Operation	The <i>friend</i> keyword.
property get	Operation	A read property.
property set	Operation	A write property.
struct	Class	A <i>struct</i> type.
typedef	Class	A <i>typedef</i> statement, where the parent is the original type name.
union	Class	A <i>union</i> type.

Tagged Values

Reference:

Tag	Applies To	Corresponds To
afx_msg	Operation	The <i>afx_msg</i> keyword.
anonymous	Class also containing the Tagged Value <i>typedef</i>	The name of this class being only defined by the <i>typedef</i> statement.
attribute_name	Operation with stereotype <i>property get</i> or <i>property set</i>	The name of the variable behind this property.
bitfield	Attribute	The size, in bits, allowed for storage of this attribute.
bodyLocation	Operation	The location the method body is generated to; expected values are header , classDec or classBody .
callback	Operation	A reference to the CALLBACK macro.
explicit	Operation	The <i>explicit</i> keyword.
initializer	Operation	A constructor initialization list.
inline	Operation	The <i>inline</i> keyword and inline generation of the method body.
mutable	Attribute	The <i>mutable</i> keyword.
throws	Operation	The exceptions that are thrown by this method.
typedef	Class with stereotype other than <i>typedef</i>	This Class being defined in a <i>typedef</i> statement.
typeSynonyms	Class	The <i>typedef</i> name and/or fields of this type.
volatile	Operation	The <i>volatile</i> keyword.

Topics:

Topic	Detail	See also
Other Conventions	<ul style="list-style-type: none"> Namespaces are generated for each package below a namespace root <i>By Reference</i> attributes correspond to a pointer to the type specified The <i>Transient</i> property of an attribute corresponds to the <i>volatile</i> keyword The <i>Abstract</i> property of an attribute corresponds to the <i>virtual</i> keyword The <i>Const</i> property of an operation corresponds to the <i>const</i> keyword, specifying a constant return type The <i>Is Query</i> property of an operation corresponds to the <i>const</i> keyword, specifying the method doesn't modify any fields The <i>Pure</i> property of an operation corresponds to a pure <i>virtual</i> method using the "0" syntax The <i>Fixed</i> property of a parameter corresponds to the <i>const</i> keyword 	Namespaces ^[1495]

11.3.5.1 Managed C++ Conventions

The following conventions are used for managed extensions to C++ prior to **C++/CLI**. In order to set Enterprise Architect to generate managed C++ you must modify the C++ version in the **C++ Options**.

Stereotypes

Stereotype	Applies To	Corresponds To
property	Operation	The <code>__property</code> keyword.
property get	Operation	The <code>__property</code> keyword and a read property.
property set	Operation	The <code>__property</code> keyword and a write property.
reference	Class	The <code>__gc</code> keyword.
value	Class	The <code>__value</code> keyword.

Tagged Values

Tag	Applies To	Corresponds To
managedType	Class with stereotype <i>reference</i> , <i>value</i> or <i>enumeration</i> ; Interface	The keyword used in declaration of this type. Expected values are <i>class</i> or <i>struct</i> .

Topics:

Topic	Detail	See also
Other Conventions	<ul style="list-style-type: none"> The <i>typedef</i> and anonymous tags from native C++ are not supported The <i>Pure</i> property of an operation corresponds to the keyword <code>__abstract</code>

11.3.5.2 C++/CLI Conventions

The following conventions are used for modeling C++/CLI extensions to C++. In order to set Enterprise Architect to generate managed C++/CLI you must modify the C++ version in the **C++ Options**.

Stereotypes

Reference:

Stereotype	Applies To	Description
event	Operation	Defines an event to provide access to the event handler for this Class.
property	Operation, Attribute	This is a property possibly containing both read and write code.
reference	Class	Corresponds to the <i>ref class</i> or <i>ref struct</i> keyword.
value	Class	Corresponds to the <i>value class</i> or <i>value struct</i> keyword.

Tagged Values

Reference:

Tag	Applies To	Description
attribute_name	Operation with stereotype <i>property</i> or <i>event</i>	The name of the variable behind this property or event.
generic	Operation	Defines the generic parameters for this Operation.
genericConstraints	Templated Class or Interface, Operation with tag <i>generic</i>	Defines the constraints on the generic parameters for this Operation.
initonly	Attribute	Corresponds to the <i>initonly</i> keyword.
literal	Attribute	Corresponds to the <i>literal</i> keyword.

Tag	Applies To	Description
managedType	Class with stereotype <i>reference</i> , <i>value</i> or <i>enumeration</i> ; Interface	Corresponds to either the <i>class</i> or <i>struct</i> keyword.

Topics:

Topic	Detail	See also
Other Conventions	<ul style="list-style-type: none"> The <i>typedef</i> and anonymous tags are not used The <i>property get/property set</i> stereotypes are not used The <i>Pure</i> property of an operation corresponds to the keyword <i>abstract</i>

11.3.6 Delphi Conventions

Enterprise Architect supports round trip engineering of Delphi, where the following conventions are used.

Stereotypes

Reference:

Stereotype	Applies To	Corresponds To
constructor	Operation	A constructor.
destructor	Operation	A destructor.
dispinterface	Class, Interface	A dispatch interface.
enumeration	Class	An enumerated type.
metaclass	Class	A metaclass type.
object	Class	An object type.
operator	Operation	An operator.
property get	Operation	A read property.
property set	Operation	A write property.
struct	Class	A record type.

Tagged Values

Reference:

Tag	Applies To	Corresponds To
attribute_name	Operation with stereotype <i>property get</i> or <i>property set</i>	The name of the variable behind this property.
overload	Operation	The <i>overload</i> keyword.
override	Operation	The <i>override</i> keyword.
packed	Class	The <i>packed</i> keyword.
property	Class	A property. See Delphi Properties for more information.
reintroduce	Operation	The <i>reintroduce</i> keyword.

Topics:

Topic	Detail	See also
Other Conventions	<ul style="list-style-type: none"> The <i>Static</i> property of an attribute or operation corresponds to the <i>class</i> keyword The <i>Fixed</i> property of a parameter corresponds to the <i>const</i> keyword The value of <i>inout</i> for the <i>Kind</i> property of a parameter corresponds to the <i>Var</i> keyword The value of <i>out</i> for the <i>Kind</i> property of a parameter corresponds to the <i>Out</i> keyword

11.3.7 Java Conventions

Enterprise Architect supports round trip engineering of Java - including **AspectJ** extensions - where the following conventions are used.

Stereotypes

Reference:

Stereotype	Applies To	Corresponds To
annotation	Interface	An <i>annotation</i> type.
enum	Attributes within a Class stereotyped <i>enumeration</i>	An <i>enumerated</i> option, distinguished from other attributes that have no stereotype.
enumeration	Class	An <i>enum</i> type.
operator	Operation	An operator.
property get	Operation	A read property.

Stereotype	Applies To	Corresponds To
property set	Operation	A write property.
static	Class or Interface	The <i>static</i> keyword.

Tagged Values

Reference:

Tag	Applies To	Corresponds To
annotations	Anything	The annotations on the current code feature.
arguments	Attribute with stereotype <i>enum</i>	The arguments that apply to this enumerated value.
attribute_name	Operation with stereotype <i>property get</i> or <i>property set</i>	The name of the variable behind this property.
dynamic	Class or Interface	The <i>dynamic</i> keyword.
generic	Operation	The generic parameters to this operation.
parameterList	Parameter	A parameter list with the ... syntax.
throws	Operation	The exceptions that are thrown by this method.
transient	Attribute	The transient keyword.

Topics:

Topic	Detail	See also
Other Conventions	<ul style="list-style-type: none"> Package statements are generated when the current package is not a namespace root The <i>Const</i> property of an attribute or operation corresponds to the final keyword The <i>Transient</i> property of an attribute corresponds to the volatile keyword The <i>Fixed</i> property of a parameter corresponds to the final keyword 	Namespaces <small>[1495]</small>

11.3.10 System C Conventions

Enterprise Architect supports round-trip engineering of SystemC, where the following conventions are used.

Stereotypes

Reference:

Stereotype	Applies To	Corresponds To
delegate	Method	A delegate.
enumeration	Inner Class	An <i>enum</i> type.
friend	Method	A <i>friend</i> method.
property	Method	A property definition.
sc_ctor	Method	A SystemC constructor.
sc_module	Class	A SystemC module.
sc_port	Attribute	A port.
sc_signal	Attribute	A signal
struct	Inner Class	A <i>struct</i> or <i>union</i> .

Tagged Values

Reference:

Tag	Applies To	Corresponds To
kind	Attribute (Port)	Port kind (<i>clocked, fifo, master, slave, resolved, vector</i>).
mode	Attribute (Port)	Port mode (<i>in, out, inout</i>).
overrides	Method	The <i>Inheritance</i> list of a method declaration.
throw	Method	The exception specification of a method.

Topics:

Topic	Detail	See also
Other Conventions	<ul style="list-style-type: none"> SystemC also inherits most of the stereotypes and Tagged Values of C++ 	C++ Conventions <small>[1465]</small>

SystemC Toolbox Pages

To access the **SystemC** pages of the **Toolbox**, select the **More tools | HDL | SystemC Constructs** menu option. Drag these icons onto a diagram to model a SystemC design.

11.3.11 VB.Net Conventions

Enterprise Architect supports round-trip engineering of Visual Basic.Net, where the following conventions are used. Earlier versions of **Visual Basic** are supported as a different language.

Stereotypes

Reference:

Stereotype	Applies To	Corresponds To
event	Operation	An event declaration.

Stereotype	Applies To	Corresponds To
import	Operation	An operation to be imported from another library.
module	Class	A module.
operator	Operation	An operator overload definition.
partial	Operation	The <i>partial</i> keyword on an operation.
property	Operation	A property possibly containing both read and write code.

Tagged Values

Reference:

Tag	Applies To	Corresponds To
Alias	Operation with stereotype <i>import</i>	The alias for this imported operation.
attribute_name	Operation with stereotype <i>property</i>	The name of the variable behind this property.
Charset	Operation with stereotype <i>import</i>	The <i>character set</i> clause for this import. One of the values <i>Ansi</i> , <i>Unicode</i> or <i>Auto</i> .
delegate	Operation	The <i>Delegate</i> keyword.
enumTag	Operation with stereotype <i>property</i>	The datatype that this property is represented as.
Handles	Operation	The <i>handles</i> clause on this operation.
Implements	Operation	The <i>implements</i> clause on this operation.
Lib	Operation with stereotype <i>import</i>	The library this import comes from.
MustOverride	Operation	The <i>MustOverride</i> keyword.
Narrowing	Operation with stereotype <i>operator</i>	The <i>Narrowing</i> keyword.
NotOverrideable	Operation	The <i>NotOverrideable</i> keyword.
Overloads	Operation	The <i>Overloads</i> keyword.
Overrides	Operation	The <i>Overrides</i> keyword.
parameterArray	Parameter	A parameter list using the <i>ParamArray</i> keyword.
partial	Class, Interface	The <i>Partial</i> keyword.
readonly	Operation with stereotype <i>property</i>	This property only defining read code.
shadows	Class, Interface, Operation	The <i>Shadows</i> keyword.
Shared	Attribute	The <i>Shared</i> keyword.
Widening	Operation with stereotype <i>operator</i>	The <i>Widening</i> keyword.
writeonly	Operation with stereotype <i>property</i>	This property only defining write code.

11.3.12 Verilog Conventions

Enterprise Architect supports round-trip engineering of Verilog, where the following conventions are used.

Stereotypes

Reference:

Stereotype	Applies To	Corresponds To
asynchronous	Method	A concurrent process.
enumeration	Inner Class	An <i>enum</i> type.
initializer	Method	An initializer process.
module	Class	A module.
part	Attribute	A component instantiation.
port	Attribute	A port.
synchronous	Method	A sequential process.

Tagged Values

Reference:

Tag	Applies To	Corresponds To
kind	Attribute (signal)	The signal kind (such as <i>register</i> , <i>bus</i>).
mode	Attribute (port)	The port mode (<i>in</i> , <i>out</i> , <i>inout</i>).
Portmap	Attribute (part)	The generic / port map of the component instantiated.
sensitivity	Method	The sensitivity list of a sequential process.
type	Attribute	The range or type value of an attribute.

Verilog Toolbox Pages

To access the **Verilog** pages of the **Toolbox**, select the **More tools | HDL | Verilog Constructs** menu option. Drag these icons onto a diagram to model a Verilog design.

Reference:

Page	Item	Action
Verilog	Module	Define a Verilog Module. <i>A module-stereotyped Class element.</i>
	Enumeration	Define an Enumerated Type. <i>An enumeration-stereotyped Class element.</i>
Verilog Features	Port	Define a Verilog Port. <i>A port-stereotyped attribute.</i>
	Part	Define a Verilog component instantiation <i>A part-stereotyped attribute.</i>
	Attribute	Define an attribute.
	Procedure <ul style="list-style-type: none"> • Concurrent • Sequential • Initializer. 	Define a Verilog process: <ul style="list-style-type: none"> • An <i>asynchronous</i>-stereotyped method • A <i>synchronous</i>-stereotyped method • An <i>initializer</i>-stereotyped method

11.3.13 VHDL Conventions

Enterprise Architect supports round-trip engineering of VHDL, where the following conventions are used.

Stereotypes

Reference:

Stereotype	Applies To	Corresponds To
architecture	Class	An architecture.
asynchronous	Method	An asynchronous process.
configuration	Method	A configuration.
enumeration	Inner Class	An <i>enum</i> type.
entity	Interface	An entity.
part	Attribute	A component instantiation.
port	Attribute	A port.
signal	Attribute	A signal declaration.
struct	Inner Class	A record definition.
synchronous	Method	A synchronous process.
typedef	Inner Class	A <i>type</i> or <i>sub type</i> definition.

Tagged Values

Reference:

Tag	Applies To	Corresponds To
isGeneric	Attribute (port)	The port declaration in a generic interface.
isSubType	Inner Class (typedef)	A subtype definition.
kind	Attribute (signal)	The signal kind (such as <i>register</i> , <i>bus</i>).
mode	Attribute (port)	The port mode (<i>in</i> , <i>out</i> , <i>inout</i> , <i>buffer</i> , <i>linkage</i>).
portmap	Attribute (part)	The generic / port map of the component instantiated.
sensitivity	Method (synchronous)	The sensitivity list of a synchronous process.
type	Inner Class (typedef)	The type indication of a type declaration.
typeNameSpace	Attribute (part)	The type namespace of the instantiated component.

VHDL Toolbox Pages

To access the **VHDL** pages of the **Toolbox**, select the **More tools | HDL | VHDL Constructs** menu option. Drag these icons onto a diagram to model a VHDL design.

Reference:

Page	Item	Action
VHDL	Architecture	Define an architecture to be associated with a VHDL entity. <i>An architecture-stereotyped Class element.</i>
	Entity	Define a VHDL entity to contain the Port definitions. <i>An entity-stereotyped interface element.</i>
	Enumeration	Define an Enumerated Type. <i>An enumeration-stereotyped enumeration element.</i>
	Struct	Define a VHDL record. <i>A struct-stereotyped Class element.</i>

11.3.14 Visual Basic Conventions

Enterprise Architect supports the round trip engineering of Visual Basic 5 and 6, where the following conventions are used. **Visual Basic .Net** is supported as a different language.

Stereotypes

Reference:

Stereotype	Applies To	Corresponds To
global	Attribute	The <i>Global</i> keyword.
import	Operation	An operation to be imported from another library.

Stereotype	Applies To	Corresponds To
property get	Operation	A property get.
property set	Operation	A property set.
property let	Operation	A property let.
with events	Attribute	The <i>WithEvents</i> keyword.

Tagged Values

Reference:

Tag	Applies To	Corresponds To
Alias	Operation with stereotype <i>import</i>	The alias for this imported operation.
attribute_name	Operation with stereotype <i>property get</i> , <i>property set</i> or <i>property let</i>	The name of the variable behind this property.
Lib	Operation with stereotype <i>import</i>	The library this import comes from.
New	Attribute	The <i>New</i> keyword.

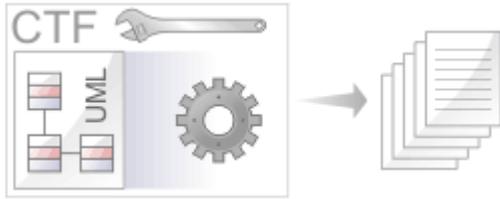

Topics:

Topic	Detail	See also
Other Conventions	<ul style="list-style-type: none"> The value of <i>in</i> for the <i>Kind</i> property of a parameter corresponds to the <i>ByVal</i> keyword The value of <i>inout</i> or <i>out</i> for the <i>Kind</i> property of a parameter corresponds to the <i>ByRef</i> keyword

11.4 Code Template Framework

The Code Template Framework (CTF) is used during forward engineering UML models. The CTF enables you to:

- Generate source code from UML models
- Customize the way in which Enterprise Architect generates source code
- Forward engineer languages not specifically supported by Enterprise Architect

Topics:

Topic	Detail	See also
Default Templates	Default Code Templates which are built into Enterprise Architect for forward engineering supported languages	Code Templates ^[1482]
Code Template Editor	A Code Template Editor for creating and maintaining user-defined Code Templates	Code Template Editor ^[1485]
Synchronize Code	Code Templates to synchronize code.	Synchronize code ^[1486]

11.4.1 Code Templates

Topics:

Topic	Detail	See also
Usage	<p>Code templates enable you to customize code generation of existing languages. For example:</p> <ul style="list-style-type: none"> • Modify the file headers created when generating new files • Change the style of the generated code (such as indenting or brace position) to match the required coding standards • Handle particular stereotypes to generate things like specialized method bodies and extra methods <p>They also enable you to add code generation of entirely new languages that Enterprise Architect would otherwise not be able to handle. In this situation it is most useful to combine code templates with an MDG technology file that includes the datatypes, and options for default file extensions.</p> <p>Enterprise Architect's base code templates specify the transformation from UML elements to the various parts of a given programming language. The templates are written as plain text with a syntax that shares some aspects of both</p>	Add Code Modules ^[1070] Base Templates ^[1483]

	<p>mark-up languages and scripting languages. A simple example of a template used by Enterprise Architect is the 'Class template'. It is used to generate source code from a UML Class:</p> <pre>%ClassNotes% %ClassDeclaration% %ClassBody%</pre> <p>The above template simply refers to three other templates, namely <i>ClassNotes</i>, <i>ClassDeclaration</i> and <i>ClassBody</i>. The enclosing percent (%) signs indicate a macro. Code Templates consist of various types of macros, each resulting in a substitution in the generated output. For a language such as C++, the result of processing the above template might be:</p> <pre>/** * This is an example class note * generated using code templates * @author Sparx Systems */ class ClassA: public ClassB { ... }</pre>	
Execution of Code Templates	<p>A reference to a template (such as the <i>%ClassNotes%</i> macro, from our example above) results in the execution of that template.</p> <p>Each template is designed for use with a particular element. For example the <i>ClassNotes</i> template is to be used with UML Class elements.</p> <p>The element that is currently being generated is said to be <i>in scope</i>. If the element in scope is stereotyped Enterprise Architect looks for a template that has been defined for that stereotype. If a match is found, the specialized template is executed. Otherwise the default implementation of the base template is used.</p> <p>Templates are processed sequentially, line by line, replacing each macro with its underlying text value from the model.</p>	

11.4.1.1 Base Templates

The Code Template Framework consists of a number of base templates. Each base template transforms particular aspects of the UML to corresponding parts of object-oriented languages.

The following table lists and briefly describes the base templates used in the CTF.

Template	Description
Attribute	A top-level template to generate member variables from UML attributes
Attribute Declaration	Used by the <i>Attribute</i> template to generate a member variable declaration
Attribute Notes	Used by the <i>Attribute</i> template to generate member variable notes
Class	A top-level template for generating Classes from UML Classes
Class Base	Used by the <i>Class</i> template to generate a base Class name in the inheritance list of a derived Class, where the base Class doesn't exist in the model

Template	Description
Class Body	Used by the <i>Class</i> template to generate the body of a Class
Class Declaration	Used by the <i>Class</i> template to generate the declaration of a Class
Class Interface	Used by the <i>Class</i> template to generate an interface name in the inheritance list of a derived Class, where the interface doesn't exist in the model
Class Notes	Used by the <i>Class</i> template to generate the Class notes
File	A top-level template for generating the source file For languages such as C++, this corresponds to the header file
Import Section	Used in the <i>File</i> template to generate external dependencies
Linked Attribute	A top-level template for generating attributes derived from UML Associations
Linked Attribute Notes	Used by the <i>Linked Attribute</i> template to generate the attribute notes
Linked Attribute Declaration	Used by the <i>Linked Attribute</i> template to generate the attribute declaration
Linked Class Base	Used by the <i>Class</i> template to generate a base Class name in the inheritance list of a derived Class, for a Class element in the model that is a parent of the current Class
Linked Class Interface	Used by the <i>Class</i> template to generate an Interface name in the inheritance list of a derived Class, for an Interface element in the model that is a parent of the current Class
Namespace	A top-level template for generating namespaces from UML packages (although not all languages have namespaces, this template can be used to generate an equivalent construct, such as packages in Java)
Namespace Body	Used by the <i>Namespace</i> template to generate the body of a namespace
Namespace Declaration	Used by the <i>Namespace</i> template to generate the namespace declaration
Operation	A top-level template for generating operations from a UML Class's operations
Operation Body	Used by the <i>Operation</i> template to generate the body of a UML operation
Operation Declaration	Used by the <i>Operation</i> template to generate the operation declaration
Operation Notes	Used by the <i>Operation</i> template to generate documentation for an operation
Parameter	Used by the <i>Operation Declaration</i> template to generate parameters

The second table lists templates used for generating code for languages that have separate interface and implementation sections.

Template	Description
Class Impl	A top-level template for generating the implementation of a Class
Class Body Impl	Used by the <i>Class Impl</i> template to generate the implementation of Class members
File Impl	A top-level template for generating the implementation file

Template	Description
File Notes Impl	Used by the <i>File Impl</i> template to generate notes in the source file
Import Section Impl	Used by the <i>File Impl</i> template to generate external dependencies
Operation Impl	A top-level template for generating operations from a UML Class's operations
Operation Body Impl	Used by the <i>Operation</i> template to generate the body of a UML operation
Operation Declaration Impl	Used by the <i>Operation</i> template to generate the operation declaration
Operation Notes Impl	Used by the <i>Operation</i> template to generate documentation for an operation

Topics:

Topic	Detail	See also
Further Information	<p>The base templates form a hierarchy, which varies slightly across different programming languages. A typical template hierarchy relevant to a language like C# or Java (which do not have header files) is shown in the example diagram below. In this diagram the templates are modeled as Classes (in reality they are just plain text). This hierarchy would be slightly more complicated for languages like C++ and Delphi, which have separate implementation templates.</p> <p>Each of the base templates must be specialized to be of use in code engineering; in particular, each template is specialized for the supported languages (or 'products')</p> <p>For example, there is a <i>ClassBody</i> template defined for C++, another for C#, another for Java, and so on; by specializing the templates, you can tailor the code generated for the corresponding UML entity</p> <p>Once the base templates are specialized for a given language, they can be further specialized based on:</p> <ul style="list-style-type: none"> • A Class's stereotype • A feature's stereotype (where the feature can be an operation or attribute) <p>This type of specialization enables, for example, a C# operation that is stereotyped as «property» to have a different <i>Operation Body</i> template from an ordinary operation; the <i>Operation Body</i> template can then be specialized further, based on the Class stereotype</p>	

11.4.2 The Code Template Editor

The Code Template Editor provides the facilities of the *Common Code Editor*, including intellisense for the various macros. For more information on intellisense and the Common Code Editor, see the **Code Editors** topic.

Access: [Settings | Code Generation Templates](#)

Reference:

Option	Action	See also
Language	Select the programming language	
New Language	Display the Programming Languages Datatypes dialog, which enables you to include programming languages other than those supported for Enterprise Architect, for which to create or edit code templates	Programming Languages Datatypes ^[777]
Template	Display the contents of the active template, and provides the editor for modifying templates	
Templates	List the base code templates; the active template is highlighted The Modified field indicates whether you have changed the default template for the current language	
Stereotype Overrides	List the stereotyped templates, for the active base template The Modified field indicates whether you have modified a default stereotyped template	
Add New Custom Template	Invoke a dialog for creating a custom stereotyped template	
Add New Stereotyped Override	Invoke a dialog for adding a stereotyped template, for the currently selected base template	
Get Default Template	Update the editor display with the default version of the active template	
Save	Overwrite the active templates with the contents of the editor	
Delete	If you have overridden the active template, the override is deleted and replaced by the corresponding default code template	

Notes:

- User-modified and user-defined Code Templates can be imported and exported as Reference Data (see the Sharing Reference Data topic. The templates defined for each language are indicated in the Export Reference Data dialog by the language name with the suffix `_Code_Templates`. If no templates exist for a language, there is no entry for the language in the dialog

11.4.3 Synchronize Code

Enterprise Architect uses code templates during the forward synchronization of the following programming languages:

- ActionScript
- C
- C++
- C#

- Delphi
- Java
- PHP
- Python
- VB
- VB.Net

Only a subset of the code templates are used during synchronization. This subset corresponds to the distinct sections that Enterprise Architect recognizes in the source code. The following table lists the code templates and their corresponding code sections, which can be synchronized.

Code Template	Code Section
Class Notes	Comments preceding Class declaration.
Class Declaration	Up to and including Class parents.
Attribute Notes	Comments preceding Attribute declaration.
Attribute Declaration	Up to and including terminating character.
Operation Notes	Comments preceding operation declaration.
Operation Notes Impl	As for <i>Operation Notes</i> .
Operation Declaration	Up to and including terminating character.
Operation Declaration Impl	Up to and including terminating character.
Operation Body	Everything between and including the braces.
Operation Body Impl	As for <i>Operation Body</i> .

Topics:

Topic	Detail	See also
Change Types	<p>Three types of change can occur in the source when it is synchronized with the UML model:</p> <ul style="list-style-type: none"> • Synchronize Existing Sections: for example, changing the return type in an operation declaration • Add New Sections to Existing Features: for example, adding notes to a Class declaration, where there were previously none • Add New Features and Elements: for example, adding a new operation to a Class <p>Each of these changes must be handled differently by Enterprise Architect; their effect on the CTF is described in the linked topics above.</p>	<p>Synchronize Existing Sections ^[1487]</p> <p>Add New Sections to Existing Features ^[1488]</p> <p>Add New Features and Elements ^[1488]</p>

11.4.3.1 Synchronize Existing Sections

Topics:

Topic	Detail	See also
Usage	When an existing section in the source code differs from the	

	<p>result generated by the corresponding template, that section is replaced. Consider for example, the following C++ Class declaration:</p> <pre>(asm) class A: public B</pre> <p>Now assume you add an inheritance relationship from Class A to Class C; the entire Class declaration would be replaced with something like:</p> <pre>(asm) class A: public B, public C</pre>	
--	--	--

11.4.3.2 Add New Sections

Topics:

Topic	Detail	See also
Usage	<p>The following can be added as new sections, to existing features in the source code:</p> <ul style="list-style-type: none"> • Class Notes • Attribute Notes • Operation Notes • Operation Notes Impl • Operation Body • Operation Body Impl <p>Assume Class A from the previous example had no note when you originally generated the code. Now assume that you specify a note in the model for Class A. Enterprise Architect attempts to add the new note from the model during synchronization. It does this by executing the <i>Class Notes</i> template.</p> <p>To make room for the new section to be inserted, you can specify how much white space to append to the section via synchronization macros. These macros are described in the Control Macros topic.</p>	Control Macros <small>[1136]</small>

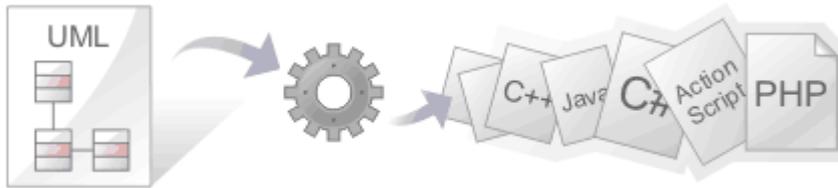

11.4.3.3 Add New Features and Elements

Topics:

Topic	Detail	See also
Usage	<p>The following features and elements can be added to the source code during synchronization:</p> <ul style="list-style-type: none"> • Attributes • Inner Classes • Operations <p>These are added by executing the relevant templates for each new element or feature in the model. Enterprise Architect attempts to preserve the appropriate indenting of new features in the code, by finding the indents specified in list macros of the Class. For languages that make use of namespaces, the <i>synchNamespaceBodyIndent</i> macro is available. Classes defined within a (non-global) namespace are indented</p>	

	<p>according to the value set for this macro, during synchronization. This value is ignored for Classes defined within a package setup as a root namespace, or if the Generate Namespace option is set to False in the appropriate language page (C#, C++ or VB.Net) on the Options dialog (Tools Options Source Code Engineering <language>).</p>	
--	--	--

11.5 Generate Source Code

Generating source code (forward engineering) takes the UML Class or Interface model elements and creates a source code equivalent for future elaboration and compilation. By forward engineering code from the model, the mundane work involved with having to key in Classes and attributes and methods is avoided, and symmetry between model and code is ensured.

Topics:

Topic	Detail	See also
Languages	Enterprise Architect supports code generation in each of the following languages: <ul style="list-style-type: none"> • Action Script • C • C# (for both .NET 1.1 and .NET 2.0) • C++ (standard, plus .NET managed C++ extensions) • Delphi • Java (including Java 1.5, Aspects and Generics) • PHP • Python • Visual Basic • Visual Basic .NET 	
Elements	Code is generated from Class or Interface model elements, so you must create the required Class and Interface elements to generate from Add attributes (which become variables) and operations (which become methods)	
Settings	Before you generate code, you should ensure the default settings for code generation match your requirements; set up the defaults to match your required language and preferences Preferences that you can define include default constructors and destructors, methods for interfaces and the Unicode options for created languages Languages such as Java support 'namespaces' and can be configured to specify a namespace root In addition to the default settings for generating code, Enterprise Architect facilitates setting specific generation options for each of the supported languages	Source Code Options ^[1517] Namespaces ^[1495] ActionScript Options ^[1458] C Options ^[1461] C# Options ^[1463] C++ Options ^[1465] Delphi Options ^[1469] Java Options ^[1470] PHP Options ^[1472] Python Options ^[1473] Visual Basic Options ^[1480] Visual Basic .NET Options ^[1475]

Code Template Framework	The Code Template Framework (CTF) enables you to customize the way Enterprise Architect generates source code and also enables generation of languages that are not specifically supported by Enterprise Architect	Code Template Framework (CTF) ^[1482]
Local Paths	Local path names enable you to substitute tags for directory names	Local Paths ^[1523] Local Paths Dialog ^[1524]
Behavioral Code	You can also generate code from three UML behavioral modeling paradigms: <ul style="list-style-type: none"> • State Machine diagrams (SW & HW) • Interaction (Sequence) diagrams (SW) • Activity diagrams (SW) 	State Machine diagrams ^[1497] Interaction (Sequence) diagrams ^[1503] Activity diagrams ^[1504]
Live Code Generation	On the Code Engineering submenu, you have the option to update your source code instantly as you make changes to your model	Code Engineering Sub-Menu ^[447]
Tasks	When you generate code, you perform one or more of the following tasks: <ul style="list-style-type: none"> • Generate a Single Class • Generate a Group of Classes • Generate a Package • Update Package Contents 	Generate a Single Class ^[1491] Generate a Group of Classes ^[1492] Generate a Package ^[1493] Update Package Contents ^[1494]

Notes:

- The tools provided by Enterprise Architect for code engineering and debugging are available in the Professional, Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- When security is enabled there are permissions for Generate Source Code and DDL and Reverse Engineer from DDL and Source Code

- [Generate From Behavioral Models](#) ^[1496]

11.5.1 Generate a Single Class

To generate code for a single Class, first ensure the design of the model element (Class or Interface) is complete. Also ensure you have added Inheritance connectors to parents and associations to other Classes that are used. Also add Inheritance connectors to Interfaces that your Class implements; Enterprise Architect offers the option to generate function stubs for all interface methods that a Class implements. Once the design is satisfactory, follow the procedure below.

To Generate Code for a Single Class, follow the steps below

How To:

Step	Action	See also
1	Open the diagram containing the Class or Interface for which to generate code.	

Step	Action	See also
2	Right-click on the required Class or Interface to display the context menu and select the Generate Code menu option, or press (F11). The Generate Code dialog displays, which enables you to control how and where your source code is generated.	
3	On the Path field, click on (...) (Browse) and select a path name for your source code to be generated to.	
4	In the Target Language field, click on the drop-down arrow and select the language to generate; this becomes the permanent option for that Class, so change it back if you are only doing one pass in another language.	
5	Click on the Advanced button. The Object Options dialog displays.	
6	Set any custom options (for this Class alone), then click on the Close button to return to the Generate Code dialog.	
7	In the Import(s) / Header(s) fields, type any import statements, <i>#includes</i> or other header information. (Note that in the case of Visual Basic this information is ignored; in the case of Java the two import text boxes are merged; and in the case of C++ the first import text area is placed in the header file and the second in the body (.cpp) file.)	
8	Click on the Generate button to create the source code.	
9	When complete, click on the View button to see what has been generated. Note that you should set up your default viewer/editor for each language type first. You can also set up the default editor on the Code Editors page of the Options dialog (Tools Options Source Code Engineering Code Editors).	The Source Code Viewer ^[1408]

11.5.2 Generate a Group of Classes

In addition to being able to generate code for an individual Class, you can also select a group of Classes for batch code generation. When you do this, you accept all the default code generation options for each Class in the set.

Steps:

Step	Detail	See also
1	Select a group of Classes and/or interfaces in a diagram	
2	Right-click on an element in the group to display the context menu.	
3	Select the Code Generation Generate Selected elements menu option. The Save As dialog displays, on which you specify the file path and name for each code file. Enter this information and click on the Save button	
4	The Batch Generation dialog displays, showing the status of the process as it executes (the process might be too fast to see this dialog).	

Notes:

- If any of the elements selected are not Classes or interfaces the option to generate code is not available

Learn More:

- [Synchronize Model and Code](#)^[1506]

11.5.3 Generate a Package

In addition to generating source code from single Classes and groups of Classes, you can also generate code from a package. This feature provides options to recursively generate child packages and automatically generate directory structures based on the package hierarchy. This enables you to generate a whole branch of your project model in one step.

To generate a package, follow the steps below

How To:

Step	Action	See also
1	In the Project Browser , right-click on the package to generate code for. The context menu displays.	
2	Select the Code Engineering Generate Source Code menu option. The Generate Package Source Code dialog displays.	
3	In the Synchronize field, click on the drop-down arrow and select the appropriate synchronize option: <ul style="list-style-type: none"> • Synchronize model and code: Classes with existing files are forward synchronized with that file; Classes with no existing file are generated to the displayed target file • Overwrite code: All selected target files are overwritten (forward generated) • Do not generate: Only selected Classes that do not have an existing file are generated; all other Classes are ignored 	
4	Highlight the Classes to generate. Leave unselected any to not generate. If you want to display the information in a more readable layout, you can resize the dialog and its columns.	
5	To make Enterprise Architect automatically generate directories and filenames based on the package hierarchy, select the Auto Generate Files checkbox. This then enables the Root Directory field, in which you select a root directory under which the source directories are to be generated. By default, the Auto Generate Files feature <i>ignores</i> any file paths that are already associated with a Class. You can change this behavior by also selecting the Retain Existing File Paths checkbox.	
6	To include all sub-packages in the output, select the Include Child Packages checkbox.	
7	Click on the Generate button to start generating code.	

As code generation proceeds Enterprise Architect displays progress messages. If a Class requires an output filename Enterprise Architect prompts you to enter one at the appropriate time (assuming **Auto Generate Files** is not selected). For example, if the selected Classes include partial Classes, a prompt displays to enter the filename for the second partial Class.

For additional information on the options on the **Generate Package Source Code** dialog, see the following

table:

Option	Action	See also
Root Package	Check the name of the package to be generated.	
Synchronize	Select options that specify how existing files should be generated.	
Auto Generate Files	Specify whether Enterprise Architect should automatically generate file names and directories, based on the package hierarchy.	
Root Directory	If Auto Generate Files is selected, display the path under which the generated directory structures are created.	
Retain Existing File Paths	If Auto Generate Files is selected, specify whether to use existing file paths associated with Classes. If unselected, Enterprise Architect generates Classes to automatically determined paths, regardless of whether source files are already associated with Classes.	
Include all Child Packages	Include all Classes from all sub-packages of the target package in the list. This option facilitates recursive generation of a given package and its sub-packages.	
Select Objects to Generate	List all Classes that are available for generation under the target packages. Only selected (highlighted) Classes are generated. Classes are listed with their target source file.	
Select All	Mark all Classes in the list as selected.	
Select None	Mark all Classes in the list as unselected.	
Generate	Start the generation of all selected Classes.	
Cancel	Exit the Generate Package Source Code dialog. No Classes are generated.	

11.5.4 Update Package Contents

To synchronize a directory tree, follow the steps below

How To:

Step	Action	See also
1	In the Project Browser , right-click on the root package of the tree to synchronize. The context menu displays.	
2	Select the Code Engineering Synchronize Package With Code menu option. The Synchronize Package Contents dialog displays.	
3	In the Update Type panel, select the radio button to Forward Engineer or Reverse Engineer the package Classes.	
4	To include child packages in the synchronization, select the Include child packages in generation checkbox.	
5	Click on the OK button to start.	

Enterprise Architect uses the directory names specified when the project source was first imported/generated and updates either the model or the source code depending on the option chosen.

11.5.5 Namespaces

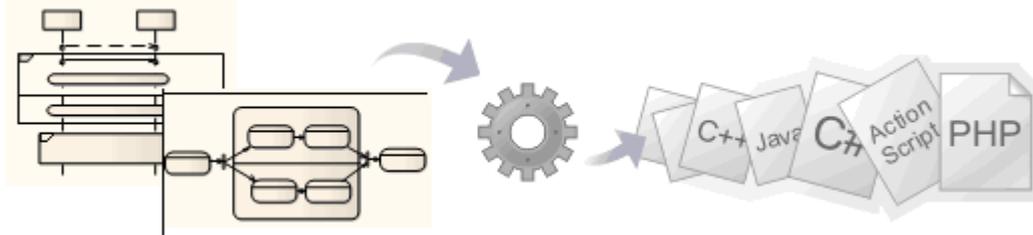

Topics:

Topic	Detail	See also
Usage	<p>Languages such as Java support package structures or namespaces. Enterprise Architect lets you specify a package as a namespace root, which denotes where the namespace structure starts; all subordinate packages below this point are generated as namespaces to code.</p> <p>To define a package as a namespace root, right-click on the package in the Project Browser and select the Code Engineering Set as Namespace Root context menu option. The package icon in the Project Browser changes to include a colored corner ().</p> <p>When you have set the namespace root, the menu option changes to Clear Namespace Root; click on this option to take the namespace root status off the package. (Also, see the context menu described below.)</p> <p>Once you have set a namespace root, Java code generated beneath this root automatically adds a package declaration at the head of the generated file indicating the current package location.</p> <p>To view a list of namespaces, select the Settings Namespace Roots menu option. The Namespaces dialog displays.</p> <p>If you double-click on a namespace in the list, the package is highlighted in the Project Browser. Alternatively, right-click on the namespace to display a context menu, and select the Locate Package in Browser menu option.</p> <p>You can also clear the selected namespace, by selecting the Clear Namespace Attribute option.</p>	

Notes:

- When performing code generation, any package name that contains whitespace characters is automatically treated as a namespace root

11.6 Generate From Behavioral Models

Enterprise Architect's system engineering capability facilitates code generation from each of the following UML behavioral diagrams:

Topic	Link
State Machine diagrams (SW & HW)	State Machine diagrams ^[1497]
Interaction (Sequence) diagrams (SW)	Interaction (Sequence) diagrams ^[1503]
Activity diagrams (SW)	Activity diagrams ^[1504]

You can generate code in various software and **hardware** languages, including C(OO), C++, C#, Java, VB, Net, VHDL, Verilog and SystemC.

To experiment with code generation from these diagrams, using the EAExample project provided with your Enterprise Architect installer, follow the steps below

How To:

Step	Action	See also
1	Open the <i>EAExample.eap</i> file by selecting the Help Open Example Model menu option.	
2	<p>From the Project Browser, select any of the following packages:</p> <p>Software Language Examples:</p> <ul style="list-style-type: none"> Project Models > System Model > Implementation Model (PSM) > Java Model With Behaviors. Generate the Account and Order classes Project Models > Systems Engineering Model > Implementation Model > Software > C#. Generate the DataProcessor Class Project Models > Systems Engineering Model > Implementation Model > Software > C++. Generate the IO Class Project Models > Systems Engineering Model > Implementation Model > Software > Java. Generate the IO Class Project Models > Systems Engineering Model > Implementation Model > Software > VBNet. Generate the IO Class <p>Hardware Language Examples:</p> <ul style="list-style-type: none"> Project Models > Systems Engineering Model > Implementation Model > Hardware > SystemC. Generate the PlayBack Class Project Models > Systems Engineering Model > Implementation Model > Hardware > VHDL. Generate the PlayBack Class 	

Step	Action	See also
	<ul style="list-style-type: none"> Project Models > Systems Engineering Model > Implementation Model > Hardware > Verilog. Generate the PlayBack Class 	
3	When completed, press (Ctrl+E) to open the generated source code. You should see methods generated in the code.	

Notes:

- Software code generation from behavioral models is available in the Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect
- Hardware code generation from State Machine models is available in the Systems Engineering and Ultimate editions of Enterprise Architect
- For C(OO), please ensure that, on the C Specifications page of the Options dialog, you have set the Object Oriented Support option to True
- To be able to generate code from behavioral models, all behavioral constructs should be contained within a Class

Learn More:

- [State Machine modeling for HDLs](#) ^[1502]

11.6.1 SW Code Generation - State Machine Diagrams

A State Machine in a *Class* internally generates the following constructs in software languages to enable effective execution of the States' behaviors (**do**, **entry** and **exit**) and also to code the appropriate transition's effect when necessary.

Topics:

Topic	Detail	See also
Enumerations	<ul style="list-style-type: none"> • StateType - comprises an enumeration for each of the States contained within the State Machine • TransitionType – comprises an enumeration for each transition that has a valid effect associated with it; for example ProcessOrder_Delivered_to_ProcessOrder_Closed • CommandType – comprises an enumeration for each of the behavior types that a State can contain (Do, Entry, Exit) 	State Machine Diagrams ^[815] Java Code Generated From State Machine Diagram ^[1498]
Attributes	<ul style="list-style-type: none"> • currState:StateType - a variable to hold the current State's information • nextState:StateType - a variable to hold the next State's information, set by each State's transitions accordingly • currTransition:TransitionType - a variable to hold the current transition information; this is set if the transition has a valid effect associated with it • transcend:Boolean - a flag used to advise if a transition is involved in transcending between different State Machines (or Submachine states) • xx_history:StateType - a history variable for each State 	State Machine Diagrams ^[815] Java Code Generated From State Machine Diagram ^[1498]

	Machine/Submachine State, to hold information about the last State from which the transition took place	
Operations	<ul style="list-style-type: none"> • StatesProc - a States procedure, containing a map between a State's enumeration and its operation; it de-references the current State's information to invoke the respective State's function • TransitionsProc - a Transitions procedure, containing a map between the Transition's enumeration and its effect; it invokes the respective effect • <<State>> - an operation for each of the States contained within the State Machine; this renders a State's behaviors based on the input CommandType, and also executes its transitions • initializeStateMachine - a function that initializes all the framework-related attributes • runStateMachine - a function that iterates through each State, and executes their behaviors and transitions accordingly 	State Machine Diagrams ^[815] Java Code Generated From State Machine Diagram ^[1498]

Notes:

- To be able to generate code from behavioral models, all behavioral constructs should be contained within a Class

11.6.2 State Machine Modeling For HDLs

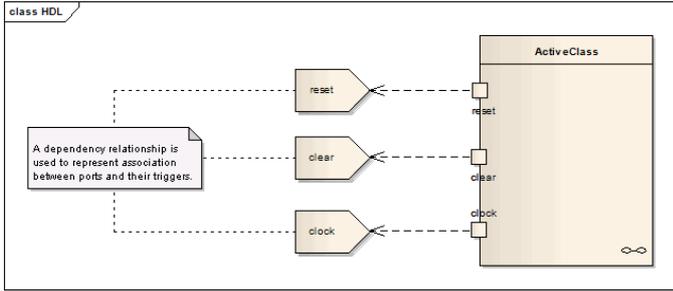

For efficient code generation from State Machine models into Hardware Description Languages (HDL) such as VHDL, Verilog and Systems C, apply the design practices outlined in this topic.

In an HDL State Machine model, the following are expected:

- Designate Driving Triggers
- Establish Port–Trigger Mapping
- Active State Logic

How To:

Topic	Detail	See also																
Designate Driving Triggers	<ul style="list-style-type: none"> • A "change" trigger is deemed as an asynchronous trigger if the following two conditions are satisfied: <ol style="list-style-type: none"> 1. There is a transition from the actual submachine state (which encapsulates the actual logic) triggered by it 2. The target state of that transition has a self transition triggered by the same trigger • Asynchronous triggers should be modeled according to the following pattern: <ol style="list-style-type: none"> 1. The trigger should be of type Change (specification: true / false) 2. The active state (Submachine State) should have a transition trigger by it. 3. The target state of the triggered transition should have a self transition with the same trigger • A trigger of type <i>time</i>, which triggers the transitions to the active state (Submachine State) is deemed as the <i>Clock</i>. The specification of this trigger should be specific to the target language: <table border="1" data-bbox="512 1305 1190 1585"> <thead> <tr> <th rowspan="2">Trigger Type</th> <th rowspan="2">Language</th> <th colspan="2">Specification</th> </tr> <tr> <th>Positive Edge Triggered</th> <th>Negative Edge Triggered</th> </tr> </thead> <tbody> <tr> <td rowspan="3">Time</td> <td>VHDL</td> <td>rising_edge</td> <td>falling_edge</td> </tr> <tr> <td>Verilog</td> <td>posedge</td> <td>negedge</td> </tr> <tr> <td>SystemC</td> <td>positive</td> <td>negative</td> </tr> </tbody> </table> 	Trigger Type	Language	Specification		Positive Edge Triggered	Negative Edge Triggered	Time	VHDL	rising_edge	falling_edge	Verilog	posedge	negedge	SystemC	positive	negative	State Machine Diagrams ^[815] Trigger ^[934]
Trigger Type	Language			Specification														
		Positive Edge Triggered	Negative Edge Triggered															
Time	VHDL	rising_edge	falling_edge															
	Verilog	posedge	negedge															
	SystemC	positive	negative															
Establish Port-Trigger Mapping	<p>After successfully modeling the different operating modes of the component, and the triggers associated with them, you must associate the triggers with the component's ports. A Dependency relationship from the Port to the associated trigger is used to signify their association.</p>																	

		
Active State Logic	The first two aspects, above, put in place the preliminaries required for efficient interpretation of the hardware components. The actual State Machine logic is now modeled within the Active (Submachine) state.	

Notes:

- To be able to generate code from behavioral models, all behavioral constructs should be contained within a Class
- The current code generation engine supports only one clock trigger for a component

11.6.3 Code Generation - Interaction Diagrams

During code generation from interaction(sequence) diagrams in a Class, Enterprise Architect applies its system engineering graph optimizer to transform the Class constructs into programmatic paradigms. Messages and Fragments are identified as one of the several action types based on their functionality, and Enterprise Architect uses the *code generation templates* to render their behavior accordingly.

Topics:

Topic	Detail	See also
Action Call	A Message that invokes an operation	Message (Sequence Diagram) ^[987] Call ^[997] Message Examples ^[992]
Action Create	A Message with <i>Lifecycle = New</i>	Message (Sequence Diagram) ^[987] Message Properties ^[988]
Action Destroy	A Message with Lifecycle = Delete	Message (Sequence Diagram) ^[987] Message Properties ^[988]
Action Loop	A Combined Fragment with Type = Alt	Combined Fragment ^[880] Interaction Operators ^[882]
Action If	A Combined Fragment with Type = loop	Combined Fragment ^[880]

		Interaction Operators ^[882]
Assign To	A call message with a valid target attribute set using the "Assign To" field is rendered in the code as the target attribute of a call action	Call ^[991] Message Properties ^[988]

Notes:

- To be able to generate code from behavioral models, all behavioral constructs should be contained within a Class
- For an Interaction (Sequence) diagram, the behavioral code generation engine expects the Sequence diagram and all its associated messages and interaction fragments to be encapsulated within an interaction element

11.6.4 Code Generation - Activity Diagrams

Code generation from an Activity Diagrams in a Class requires a validation phase, during which Enterprise Architect uses the system engineering graph optimizer to analyze the diagram and render it into various code-generatable constructs. Enterprise Architect also transforms the constructs into one of the various action types (if appropriate), similar to the Interaction diagram constructs.

Topics:

Topic	Detail	See also
Call Actions (Invocation Actions)	<p>Call Actions are used to invoke operations or behaviors in an Activity diagram. The two main variants of Call Actions supported in behavioral code generation are:</p> <ul style="list-style-type: none"> • CallOperationAction - used to invoke operations, which can be within the same Class or in other Classes within the same package. If referencing operations from other Classes within the same package, you must have a target to which the request is passed • CallBehaviorAction - used to invoke another Activity in an activity flow. The referenced activity is expected to be within the same Class <p>Arguments</p> <p>Call Actions can specify argument values corresponding to the parameters in the associated behavior or behavioral feature. You can add the arguments manually or create them automatically using the the Synchronize button of the Arguments dialog.</p>	Assign Action Pins ^[870] Behavior Calls ^[715] Synchronize Arguments ^[716]
CreateObjectActi	CreateObjectAction is used to denote an object	Assign Action Pins ^[870]

on	<p>creation in the activity flow. You can set the result Pin of the CreateObjectAction as the object to be created, using the Assign Action Pins dialog.</p> <p>The Classifier of the CreateObjectAction signifies the Classifier for which an instance is to be created.</p>	
DestroyObjectAction	<p>DestroyObjectAction is used to denote an object deletion in the activity flow. You can set the target Pin of the DestroyObjectAction as the object to be destroyed, using the Assign Action Pins dialog.</p>	Assign Action Pins ^[870]
Loops	<p>Enterprise Architect's system engineering graph optimizer is also capable of analyzing and identifying loops. An identified loop is internally rendered as an Action Loop, which is translated by the EASL code generation macros to generate the required code</p>	
Conditional Statements	<p>To model a conditional statement, you use Decision/Merge nodes. Alternatively, you can imply Decisions/Merges internally. The graph optimizer expects an associated Merge node for each Decision node, to facilitate efficient tracking of various branches and analysis of the code constructs within them.</p>	

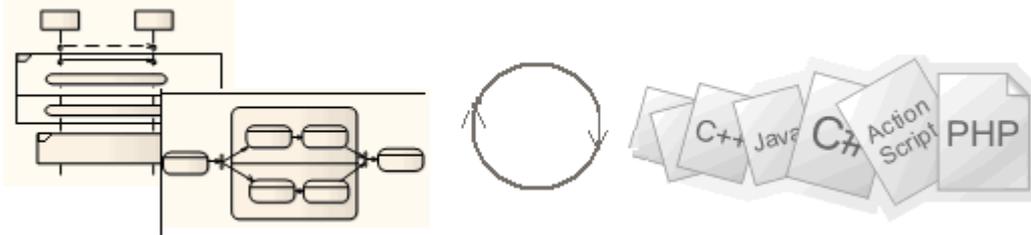

Notes:

- To be able to generate code from behavioral models, all behavioral constructs should be contained within a Class

11.7 Synchronize Model and Code

In addition to generating and importing code, Enterprise Architect provides the option to synchronize the model and source code, creating a model that represents the latest changes in the source code and vice versa. You can use either the model as the source, or the code as the source.

For example: you generated some source code, but made subsequent changes to the model. When you generate code again, Enterprise Architect *adds* any new attributes or methods to the existing source code, leaving intact what already exists. This means developers can work on the source code and then generate *additional* methods as required from the model, without having their code overwritten or destroyed.

Similarly, you might have made changes to a source code file, but the model has detailed notes and characteristics you do not want to lose. By synchronizing from the source code into the model, you import additional attributes and methods but do not change other model elements.

Using the two synchronization methods above, it is simple to keep source code and model elements up to date and synchronized.

Topics:

Topic	Detail	See also
Synchronize Classes on Forward Generation	<p>When there are features present in the code but not in the model you can use the following buttons during forward synchronization:</p> <ul style="list-style-type: none"> • Delete: when you click on this button the selected code features are removed from the code • Reassign: when you click on this button the code elements are reassigned to elements in the model (this is only possible when an appropriate model element is present that is not already defined in the code) • Ignore: when you click on this button the code elements not present in the model are ignored completely • Reset to Default: when you click on this button the settings for synchronizing during forward generation are set to Ignore, meaning that the elements present in the code but not in the model are ignored completely 	<p>Generate Source Code ^[1490]</p> <p>Generate Source Code and DDL ^[205]</p>

Notes:

- Code synchronization does not change method bodies. Behavioral code generation only works when generating the entire file
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have Generate Source Code and DDL permission

to synchronize source code with model elements

- The buttons to influence features generation are only available when the 'On forward synch, prompt to delete code features not in model' checkbox is selected in the Options - Attributes and Operations dialog

11.8 Importing Source Code

Topics:

Topic	Detail	See also
Usage	<p>Reverse Engineering in Enterprise Architect enables you to import existing source code from a variety of code languages into a UML model. Existing source code structures are mapped into their UML representations, for example a Java Class is mapped into a UML Class element with the variables being defined as attributes, methods are modeled as operations and the interactions between the Java Classes being displayed in the UML model Class diagram with the appropriate connectors.</p> <p>Reverse Engineering enables users to examine legacy code and examine the functionality of code libraries for reuse or to bring the UML model up to date with the code that has been developed as part of a process called <i>synchronization</i>. Examining the code in a UML model enables user to identify the critical modules contained the code, enabling a starting point for understanding of the business and system requirements of the pre-existing system and to enable the developers to gain a better overall understanding of the source code.</p> <p>To begin the process of importing existing code into Enterprise Architect, an existing source of code must be imported into Enterprise Architect, which can be a single directory or a directory structure. Several options are available when performing the reverse engineering process. The Source Code Engineering Options topic contains several options that affect the reverse engineering process. These include:</p> <ul style="list-style-type: none"> • If comments are reverse engineered into notes fields, and how they are formatted if they are • How property methods are recognized • If dependencies should be created for operation return and parameter types <p>It is important to note that when a legacy system is not well designed, simply importing the source into Enterprise Architect does not create an easily understandable UML model. When working with a legacy system that is poorly designed it is useful to break down the code into manageable components by examining the code elements individually. This can be achieved by importing a specific Class of interest into a diagram and then inserting the related elements at one level to determine immediate relationship to other Classes. From this point it is possible to create Use Cases that identify the interaction between the legacy Classes, enabling an overview of the legacy system's operation.</p>	<p>Imported Source Code ^[1510]</p> <p>Import a Directory Structure ^[1513]</p> <p>Source Code Options ^[1517]</p> <p>Insert Related Elements ^[652]</p>
Copyright	Copyright ownership is an important issue to take into account	

Ownership	<p>when undertaking the process of reverse engineering. In some cases, software might have specific limitations that prohibit the process of reverse engineering. It is important that a user address the issue of copyright before beginning the process of reverse engineering code. Situations that typically lend themselves to reverse engineering source code include source code that:</p> <ul style="list-style-type: none"> • You have already developed • Is part of a third-party library that you have obtained permission to use • Is part of a framework that your organization uses • Is being developed on a daily basis by your developers 	
------------------	---	--

Enterprise Architect currently supports reverse engineering in the following programming languages:

11.8.1 Import Source Code

To import source code (reverse engineer) follow the steps below

How To:

Step	Action	See also
1	In the Project Browser , select (or add) a diagram into which to import the Classes.	
2	Right-click on the diagram background to open the context menu and either: <ul style="list-style-type: none"> Select the language to import from the Import from source file(s) submenu Click on the Import Language drop-down arrow in the Code Generation toolbar and select the Import Import xxx files menu option, where xxx represents the language to import 	
3	From the file browser that appears, select one or more source code files to import.	Notes on Source Code Import ^[1510]
4	Click on the Open button to start the import process.	

As the import proceeds, Enterprise Architect provides progress information. When all files are imported, Enterprise Architect makes a second pass to resolve associations and inheritance relationships between the imported Classes.

11.8.2 Notes on Source Code Import

Enterprise Architect enables you to **import code** into your project, in the following programming languages:

Topic	Link
Action Script	ActionScript ^[1458]
C	C ^[1461]
C#	C# ^[1463]
C++	C++ ^[1465]
Delphi	Delphi ^[1469]
Java	Java ^[1470]
PHP	PHP ^[1472]

Topic	Link
Python	Python ^[1473]
Visual Basic	Visual Basic ^[1480]
Visual Basic .NET	Visual Basic .NET ^[1475]

Topics:

Topic	Detail	See also
Introduction	<p>Enterprise Architect supports most constructs and keywords for each coding language.</p> <p>If there is a particular feature you require support for that you feel is missing, please contact Sparx Systems.</p> <p>You must select the appropriate type of source file for the language, as the source code to import.</p>	Sparx Systems (Online resource)
ActionScript	Appropriate type of source file: .as .	
C	<p>Appropriate type of source file: .h header files and/or .c files.</p> <p>When you select a header file Enterprise Architect automatically searches for the corresponding .c implementation file to import based on the options for extension and search path specified in the C options.</p> <p>Enterprise Architect does not expand macros that have been used, these must be added into the internal list of Language Macros.</p>	C options ^[1531] Language Macros ^[1525]
C++	<p>Appropriate type of source file: .h header file.</p> <p>Enterprise Architect automatically searches for the .cpp implementation file based on the extension and search path set in the C++ options. When it finds the implementation file it can use it to resolve parameter names and method notes as necessary.</p> <p>When importing C++ source code, Enterprise Architect ignores function pointer declarations. To import them into your model you could create a typedef to define a function pointer type, then declare function pointers using that type. Function pointers declared in this way are imported as attributes of the function pointer type.</p> <p>Enterprise Architect does not expand macros that have been used; these must be added into the internal list of Language Macros.</p>	C++ options ^[1533] Language Macros ^[1525]
C#	Appropriate type of source file: .cs .	
Delphi	Appropriate type of source file: .pas .	
Java	<p>Appropriate type of source file: .java.</p> <p>Enterprise Architect supports the AspectJ language extensions.</p>	

	 <pre> classDiagram class ThingObserving { <<aspect>> -observers: Vector = new Vector() +addObserver(Thing, Thing) : void +removeObserver(Thing, ThingObserver) : void ~updateObserver(Thing, ThingObserver) : void <<advice>> +after(Thing) : void changes(t) <<pointcut>> ~changes(Thing) : void target(t) && call(Void Thing.set*(int)) </pre> <p>Aspects are modeled using Classes with the stereotype aspect. These aspects can then contain attributes and methods as for a normal Class. If an <i>intertype</i> attribute or operation is required, you can add a tag <i>className</i> with the value being the name of the Class it belongs to.</p> <p><i>Pointcuts</i> are defined as operations with the stereotype of <i>pointcut</i>. These can occur in any Java Class, Interface or aspect. The details of the <i>pointcut</i> are included in the behavior field of the method.</p> <p>Advice is defined as an operation with the stereotype advice. The <i>pointcut</i> this advice operates on is in the behavior field and acts as part of the method's unique signature. After advice can also have one of the Tagged Values <i>returning</i> or <i>throwing</i>.</p>	
PHP	Appropriate type of source file: .php, .php4, or .inc. Nested if condition syntax is enabled.	
Python	Appropriate type of source file: .py.	
Visual Basic	Appropriate type of source file: .cls Class file.	
Visual Basic .NET	Appropriate type of source file: .vb Class file.	

Notes:

- When reverse engineering attributes with parameter substitutions (templated attributes):
 - If a Class with proper **template parameter definitions** is found, an Association connector is created and its parameter substitutions are configured
 - An Association connector is also created if a matching entry is defined as a **Collection Class** or in the Additional Collection Classes option (for **C#**, **C++** and **Java**). For an example, see **Example Use of Collection Classes**

11.8.3 Import a Directory Structure

You can import from all source files in a complete directory structure. This process enables you to import or synchronize multiple files in a directory tree in one pass. Enterprise Architect creates the necessary packages and diagrams during the import process.

To import a directory structure, follow the steps below

How To:

Step	Action	See also
1	In the Project Browser , right-click on the target package for the import.	
2	From the context menu, select the Code Engineering Import Source Directory menu option. The Import Source Directory dialog displays.	
3	Select the options you require. You can configure: <ul style="list-style-type: none"> • The source directory • The source type • The file extensions to look at • Whether to recurse sub directories • Whether to create a diagram for each package • Whether to import additional files as described in the Import Component Types dialog • Whether to exclude private members from libraries being imported from the model • Whether to create a package for every directory, namespace or file; this might be restricted depending on the source type selected • Whether to Synchronize or Overwrite existing Classes when found (if a model Class is found matching the one in code, Synchronize updates the model Class to include the details from the one in code, which preserves information not represented in code such as the location of Classes in diagrams; Overwrite <i>deletes</i> the model Class and generates a new one from code, which deletes and does not replace the additional information) • How to handle Classes not found during the import (Prompt for action enables you to review Classes individually) • What is shown on diagrams created by the import 	Classes not found during Import ^[1513]
4	Click on the OK button to start.	

11.8.4 Import Binary Module

Enterprise Architect enables you to reverse-engineer certain types of binary modules.

Access: Right-click on a package within the Project Browser | Code Engineering | Import Binary Module

Topics:

Topic	Detail	See also

<p>Usage</p>	<p>Currently the permitted types are as follows:</p> <ul style="list-style-type: none"> • Java Archive (.jar) • .Net PE file (.exe, .dll); native Windows DLL and EXE files are not supported, only PE files containing .NET assembly data • Intermediate Language file (.il) <p>Enterprise Architect creates the necessary packages and diagrams during the import process. Selecting the Do not import private members checkbox excludes private members from libraries from being imported into the model.</p> <p>When importing .Net files, you can import via reflection or via disassembly, or let Enterprise Architect decide the best method - this might result in both types being used. The reflection-based importer relies on a .Net program, and requires the .Net runtime environment to be installed. The disassembler-based importer relies on a native Windows program called <i>lldasm.exe</i>, which is a tool provided with the MS .Net SDK. The SDK can be downloaded from the Microsoft website.</p> <p>A choice of import methods is available because some files are not compatible with reflection (such as <i>mscorlib.dll</i>) and can only be opened using the disassembler. However, the reflection-based importer is generally much faster.</p> <p>You can also configure:</p> <ul style="list-style-type: none"> • Whether to Synchronize or Overwrite existing Classes when found (if a model Class is found matching the one in the file, Synchronize updates the model Class to include the details from the one in the file, which preserves information not represented in the file such as the location of Classes in diagrams; Overwrite deletes the model Class and generates a new one from the file, which deletes and does not replace the additional information) • Whether to create a diagram for each package • What is shown on diagrams created by the import

11.8.6 Classes Not Found During Import

Topics:

Topic	Detail	See also
Usage	<p>When reverse synchronizing from your code, there are times when some Classes might be deliberately removed from your source code. Enterprise Architect's import source directory functionality keeps track of the Classes it expects to synchronize with and, on the Import Directory Structure dialog, provides options for how to handle the Classes that weren't found. You can select the appropriate action so that, at the end of the import, Enterprise Architect either ignores the missing Classes, automatically deletes them or prompts you to handle them.</p> <p>If you select the Prompt For Action radio button on the Import Directory Structure dialog, to manually review missing Classes a dialog is displayed allowing you to specify the handling for each class that was missing in the imported code. By default, all Classes are marked for deletion. To keep one or more Classes, select them and click on the Ignore button.</p>	Import a Directory Structure ^[1513]

11.9 Other Settings

You can set the default code options such as the editors for each of the programming languages available for Enterprise Architect and special options for how source code is generated or reverse engineered.

Local Path Dialog	Enables you to set up local paths for a single user on a particular machine	Local Path Dialog <small>[1524]</small>
Language Macros	Describes how to define macros, which is helpful for reverse engineering	Language Macros <small>[1525]</small>
Set Collection Classes	Describes how to define Collection Classes	Set Collection Classes <small>[1526]</small>

11.9.1 Source Code Engineering

The following topics describe general options that apply to all languages when generating code from Enterprise Architect. These options are all available under the Source Code Engineering section of the Options dialog

Access: **Tools | Options | Source Code Engineering**

Topic	Detail	Link
Source Code Options	You can set certain defined options for a particular language while generating the code	Source Code Options <small>[1517]</small>
Options - Code Editors	Describes how to access and configure the source code editor	Options - Code Editors <small>[1519]</small>
Options - Object Lifetimes	Describes configuring various options concerning Object Lifetimes	Options - Object Lifetimes <small>[1521]</small>
Options - Attributes/Operations	Describes configuring Attributes/Operations	Options - Attribute/Operations <small>[1522]</small>
Synchronize Model and Code	Describes synchronizing the model and source code	Synchronize Model and Code <small>[1506]</small>

Topic	Detail	Link
Code Page for Source Editing	Provides an option to define the Unicode character set for code generation	Code Page for Source Editing ^[1523]

11.9.1.1 Source Code Options

When you generate code for a particular language, you can set certain options. These include:

- Create a default constructor
- Create a destructor
- Generate copy constructor
- Select default language
- Generate methods for implemented interfaces
- Set the Unicode options for code generation

Access: [Tools](#) | [Options](#) | [Source Code Engineering](#)

Use to:

- Configure code generation options

Reference:

Field	Usage	See also
Always synchronize with existing file (recommended)	Indicates that imported code synchronizes with an existing file	
Replace (overwrite) existing source file	Indicates that imported code overwrites an existing source file	
Component Types	Allows for the importation of component types, this opens the Import component types dialog	Import Component Types ^[1518]
Default Language for Code Generation:	Indicates the default coding language used in code generation	
Wrap long comment lines at:	Specifies the line length to wrap comments within	
Auto Layout Diagram on Import:	Specifies if and when a diagram is automatically generated on code import	
Output file use both CR & LF	Indicates if carriage return and line feed is a used; ensure that this option is set according to what operating system is currently in use as code might not render correctly	
Prompt when synchronizing (reversing)	Ensures that a prompt displays when synchronization occurs	
Remove hard breaks from comments on import	Indicates that hard breaks are removed from commented sections on importation	

Auto generate role names when creating code	Indicates that role names are generated when creating code	
Do not generate role names when creating code	Indicates that role names are not generated when creating code	
Do not generate members where association direction is "Unspecified"	If association direction is "unspecified", members are not generated	
Create dependencies for operation returns and parameter types	Creates dependencies for operation returns and parameter types	
Comments: Generate	Indicates that comments are generated	
Comments: Reverse	Indicates that reverse comments are generated	
Remove prefixes when generating Get/Set properties	Enables specification of prefixes used in your variable naming conventions, if those prefixes should be removed in the variables' corresponding get/set functions	
Treat as suffixes	Treats the prefixes defined within Remove prefixes when generating Get/Set properties as suffixes	
Capitalized Attribute Name for properties	Capitalizes Attribute names for properties	
Use "Is" for Boolean property Get()	Indicates that the /s keyword is used for the Boolean property Get()	
Code page for source editing	Specifies the character embedding format	

Notes:

- It is worthwhile to configure these settings, as they serve as the defaults for all Classes in the model; you can override these on a per-Class basis using the custom settings (from the Code Generation dialog)

11.9.1.1.1 Import Component Types

The Import Component Types dialog enables you to configure what elements you would like to be created for files of any extension found while importing a source code directory.

Access: **Tools | Options | Source Code Engineering : Component Types**

Use to:

- Configure what elements are to be created for files of any extension found while importing a source code directory

Reference:

Field	Usage	See also
Extension	Indicates the extension name for a component type	
Type	Indicates the type for a component	
Stereotype	Indicates the stereotype name given to a component	
Component List	The defined list of component types	
Save	Saves a component definition and adds it to the component list	
New	Allows a new component type to be defined	
Delete	Deletes a highlighted component from the component list	

Notes:

- You can transport these import component types between models, using the Export Reference Data and Import Reference Data options

Learn More:

- [Export Reference Data](#)^[237]
- [Import Reference Data](#)^[239]

11.9.1.2 Options - Code Editors

You access the source code editor options via the Code Editors page of the Options dialog. They enable you to configure options for Enterprise Architect's internal editor, as well as the default editor for DDL scripts. You can configure external editors for code languages on each language options page.

Access: **Tools | Options | Source Code Engineering > Code Editors**

Use to:

- Configure options for Enterprise Architect's internal editor
- Configure the default editor for DDL Scripts
- Configure DDL Name Templates

Reference:

Field	Usage	See also
DDL Editor	Specifies what DDL Editor is currently in use; the (...) button opens a dialog that enables you to choose a default DDL editor	
Default Database	Indicates the default database used	
MySQL Storage Engine	Indicates the storage engine used	
DDL Name Templates	Specifies the Foreign Key, Primary Key and Unique Constraint Name templates; the (...) button enables you to specify template names	

Field	Usage	See also
Use inbuilt editor if no external editor set	Specifies the editor for code in a language if no external editor is defined for that language	
Show Line Numbers	Shows line numbers in the editor	
Show Structure Tree	Shows a tree with the results of parsing the open file (requires that the file is parsed successfully)	
Don't parse files larger than	Specifies an upper limit on file size for parsing Use this to prevent performance decrease due to parsing very large files	
Syntax Highlighting Options	Specifies both global and language-specific editor language properties	Editor language properties ^[1520]
Automatically Reverse Engineer on File Save	When this is checked, pressing (Ctrl) + (S) to save in the source code editor automatically reverse engineers the code in the same way as the Save Source and Re-Synchronize Class button does	

11.9.1.2.1 Editor Language Properties

Enterprise Architect enables you to specify syntax highlighting properties for all the programming languages that Enterprise Architect supports at installation.

Access: [Tools](#) | [Options](#) | [Source Code Engineering](#) > [Code Editors](#) : [Syntax Highlighting Options](#) (...)

Use to:

- Configure Syntax highlighting for various coding languages

Reference:

Topic	Detail	See also
General Features	<p>The Syntax Highlighting Options button displays the Editor Language properties dialog</p> <p>The panel on the left of the dialog lists the languages for which you can set properties</p> <p>The <i>(Global)</i> item at the top of the list enables you to set properties that apply to all programming languages; however, you can reset a global property to a different value for a specific language, on the page for that language</p> <p>Resetting a global property for one language does not affect that property's value for the other languages</p> <p>Click on the required language in the list, to display the properties for that language:</p> <ul style="list-style-type: none"> • Properties shown in bold indicate that this is the highest level at which this property can be defined (for most language options other than <i>Global</i>, this is effectively the only point at which the property is defined) • Properties shown in normal font are generally the global 	

Topic	Detail	See also
	<p>properties that you can reset just for the current language</p> <p>Scroll through the property categories and individual properties for the language; you can collapse and expand categories as necessary, using the expansion box next to the category name (☐)</p> <p>When you click on a property name, an explanation of that property displays in the panel at the bottom right of the dialog</p>	
Define Properties	<p>To define a property, click on the value field following the property name; depending on the type of property, either the field is enabled for direct editing or a drop-down arrow or Browse button displays (as described for the Tagged Values window) to enable you to select the values to define the property</p> <p>Select or type in the required values</p> <p>The Toolbar icons enable you to:</p> <ul style="list-style-type: none"> • Save your changes to the properties • Reset ALL properties fields to the default settings shipped with Enterprise Architect • Reset the current style field to the default setting (not enabled for non-style fields) 	Tagged Values ^[766]
Assign Keys to Macros	<p>The Macros category enables you to assign (Ctrl+Alt+n) keystroke combinations to coding macros that you have created yourself in the Source Code Viewer</p> <p>When you click on the Browse button in a selected Macro field, the Open Macro dialog displays; this dialog lists the existing macros and, if a key combination has been assigned to a macro, what that key combination is</p> <p>Click on the name of the macro and on the Open button to assign the selected keys to the macro</p>	Source Code Viewer ^[1410]

Notes:

- You cannot currently set properties for any additional languages you include through an MDG Technology
- You can resize this dialog, if required

Learn More:

- [Syntax Highlighting](#)^[1395]
- [MDG Technology](#)^[1070]

11.9.1.3 Options - Object Lifetimes

This set of options enables you to configure various options concerning Object Lifetimes.

Access: **Tools | Options | Source Code Engineering > Object Lifetimes**

Use to:

- Define constructor details when generating code
- Specify whether to create a copy constructor
- Destructor details

Reference:

Field	Usage	See also
Constructor	This set of options specify if a constructor is generated, if a constructor is in-line and the visibility of the default constructor	
Copy Constructor	This set of options specify if a copy constructor is generated, if a copy constructor is in-line and the visibility of the default copy constructor	
Destructor	This set of options specify if a destructor is generated, if a destructor is in-line, if a destructor is defined as <i>virtual</i> and the visibility of the default constructor	

Notes:

- Some options are related to C++ only

11.9.1.4 Options - Attribute/Operations

The Options - Attributes/Operations section enables you to configure Attribute and Operations specifications.

Access: [Tools](#) | [Options](#) | [Source Code Engineering](#) > [Attribute/Operations](#)

Use to:

- Configure the default name generated from imported attributes
- Generate methods for implemented interfaces
- Delete model attributes not included in the code during reverse synchronization
- Delete model methods not included in the code during reverse synchronization
- Delete code from features contained in the model during forward synchronization
- Delete model associations and aggregations that correspond to attributes not included in the code during reverse synchronization
- Define whether or not the bodies of methods are included and saved in the Enterprise Architect model when reverse engineering
- Create attributes in quick succession, clearing the dialog when you click on **Save** so that you can enter another attribute name

Reference:

Field	Usage	See also
Attribute Specifications: Default name for associated	Specifies the default name generated from imported attributes	
Attribute Specifications: On reverse synch, delete model attributes not in code	Indicates that on reverse synchronization, model attributes not included within code are removed	

Field	Usage	See also
Attribute Specifications: On reverse synch, delete model associations not in code	Indicates that on reverse synchronization, model associations not included within code are removed	
Operation Specifications: Generate methods for implemented interface	Indicates that methods are generated for an implemented interface	
Operation Specifications: On reverse synch, delete model methods not in code	Indicates that on reverse synchronization, model methods not included within code are removed	
Operation Specifications: Include method bodies in model when reverse engineering	Indicates that on reverse engineering code, method bodies are included within your model	
Options: After Save, re-select edited item	Indicates that after saving, the dialog clears allowing for another attribute name to be specified	
On forward synch, prompt to delete code features not in mode	Indicates that a prompt displays to remove features not in the mode during forward synchronization	

11.9.1.5 Code Page for Source Editing

Enterprise Architect enables you to define the Unicode character set for code generation.

Access: [Tools](#) | [Options](#) | [Source Code Engineering](#)

How To:

To set the Unicode character set, follow the steps below:

Step	Action	See also
1	Select the Source Code Engineering option The Source Code Engineering page of the Options dialog displays	
2	In the Code page for source editing field, click on the drop-down arrow and select the appropriate Unicode character set	
3	Click on the Close button	

11.9.2 Local Paths

Access: [Settings](#) | [Local Directories and Paths](#)

Topics:

Topic	Detail	See also
General	Sometimes a team of developers could be working on the same	Local Paths

Topic	Detail	See also
Features	<p>Enterprise Architect model; each developer might store their version of the source code in their local file system, but not always at the same location as their fellow developers</p> <p>To handle this scenario, Enterprise Architect enables you to define local paths for each Enterprise Architect user, using the Local Paths dialog (select the Local Directories and Paths menu option)</p> <p>You can use local paths in generating code and reverse engineering, and in version control, developing XML schemas and generating RTF and HTML reports</p> <p>Local paths take a bit of setting up, but if you want to work collaboratively on source and model concurrently, the effort is well worth while</p> <p>For example:</p> <ul style="list-style-type: none"> • Developer A stores her .java files in a <code>C:\Java\Source</code> directory, while developer B stores his in <code>D:\Source</code> • Both developers want to generate and reverse engineer into the same Enterprise Architect model located on a shared (or replicated) network drive <p>Developer A might define a local path of:</p> <pre>JAVA_SOURCE = " C: \ J a v a \ S o u r c e "</pre> <p>All Classes generated and stored in the Enterprise Architect project are stored as:</p> <pre>%J A V A _ S O U R C E % \ < x x x . j a v a ></pre> <p>Developer B defines a local path as:</p> <pre>J A V A _ S O U R C E = " D : \ S o u r c e "</pre> <p>Now, Enterprise Architect stores all java files in these directories as:</p> <pre>%J A V A _ S O U R C E % \ < f i l e n a m e ></pre> <p>On each developer's machine, the filename is expanded to the correct local version</p>	Dialog ¹⁵²⁴

11.9.3 Local Paths Dialog

The Local Paths dialog enables you to set up local paths for a single user on a particular machine. For a description of what Local Paths are used for, see the *Local Paths* topic.

Access: [Settings | Local Directories and Paths](#)

Topics:

Topic	Detail	See also
General Usage	<p>The Local Paths dialog enables you to define:</p> <ul style="list-style-type: none"> • Path - the local directory in the file system (for example, <code>d:\java\source</code>) • ID - the shared ID that is substituted for the Local Path (for example, <code>JAVA_SRC</code>) • Type - the language type (for example, <code>Java</code>) 	

Topic	Detail	See also
	<p>And also:</p> <ul style="list-style-type: none"> • Apply Path - select a path and click on this button to update any existing paths in the model (with full path names) to the shared relative path name (for example: d: \ j a v a \ s o u r c e \ m a i n . j a v a might become % J A V A _ S R C % \ m a i n . j a v a) • Expand Path - the opposite of Apply Path; this enables you to remove a relative path and substitute the full path name <p>Using the two options you can update and change existing paths</p>	

Notes:

- You can also set up a hyperlink on a diagram to access the Local Paths dialog, to switch, update or expand your current Local Path

Learn More:

- [Local Paths](#)^[1523]
- [Hyperlink](#)^[1292]

11.9.4 Language Macros

When reverse engineering a language such as C++, you might find preprocessor directives scattered throughout the code. This can make code management easier, but can hamper parsing of the underlying C++ language.

To help remedy this, you can include any number of *macro* definitions, which are ignored during the parsing phase of the reverse engineering. It is still preferable, if you have the facility, to preprocess the code using the appropriate compiler first; this way, complex macro definitions and defines are expanded out and can be readily parsed. If you don't have this facility, then this option provides a convenient substitute.

Access: [Settings | Preprocessor Macros](#)

How To:

To define a macro, follow the steps below:

Step	Action	See also
1	Select the Preprocessor Macros menu option The Language Macros dialog displays	
2	Click on the Add New button	
3	Enter details for your macro	
4	Click on the OK button	

Topics:

Topic	Detail	See also
Macros Embedded Within Declarations	<p>Macros are sometimes used within the declaration of Classes and operations, as in the following examples:</p> <pre>class __declspec Foo { int __declspec Bar(int p); };</pre> <p>If <i>declspec</i> is defined as a C++ macro, as outlined above, the imported Class and operation contain a Tagged Value called <i>DeclMacro1</i> with value <i>__declspec</i> (subsequent macros would be defined as <i>DeclMacro2</i>, <i>DeclMacro3</i> and so on)</p> <p>During forward engineering, these Tagged Values are used to regenerate the macros in code</p>	
Define Complex Macros	<p>It is sometimes useful to define rules for complex macros that can span multiple lines;Enterprise Architect ignores the entire code section defined by the rule</p> <p>Such macros can be defined in Enterprise Architect as in the following two examples; both types can be combined in one definition</p> <p>Block Macros</p> <pre>BEGIN_INTERFACE_PART ^ END_INTERFACE_PART</pre> <p>where the ^ symbol represents the body of the macro - this enables skipping from one macro to another; the spaces surrounding the ^ symbol are required</p> <p>Function Macros</p> <pre>RTTI_EMULATION()</pre> <p>where Enterprise Architect skips over the token including everything inside the parentheses</p>	

Notes:

- You can transport these language macro (or preprocessor macro) definitions between models, using the **Export Reference Data** and **Import Reference Data** options; the macros are exported as a Macro List

Learn More:

- [Export Reference Data](#)^[237]
- [Import Reference Data](#)^[239]

11.9.5 Set Collection Classes

Enterprise Architect enables you to define *Collection Classes* for generating code from Association connectors where the target role has a multiplicity setting greater than 1.

Topic	Detail	See Also
Defining Collection Classes	On the Source Code Engineering section of the Options dialog (select the Tools Options Source Code Engineering option), on each language page	Source Code Options ^[151]

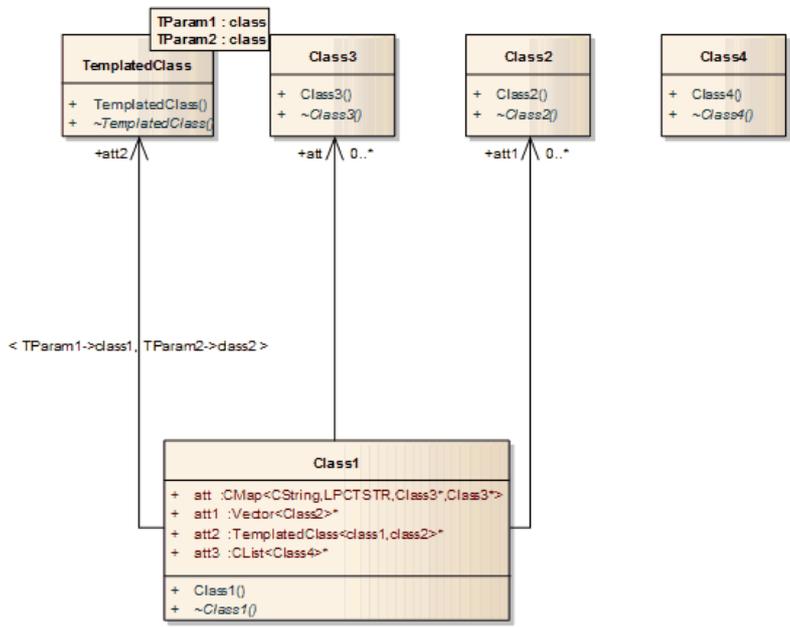

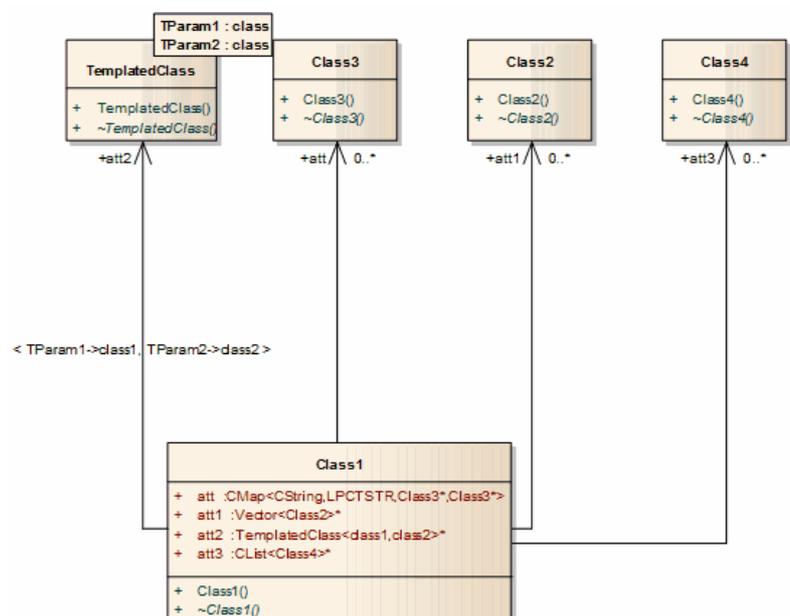

Topic	Detail	See Also
	<p>click on the Collection Classes button</p> <p>The Collection Classes for Association Roles dialog displays</p> <p>On this dialog, you can define:</p> <ul style="list-style-type: none"> • The default Collection Class for 1..* roles • The ordered Collection Class to use for 1..* roles • The qualified Collection Class to use for 1..* roles 	
<p>Defining Collection Classes for a specific Class</p>	<p>Class-specific Collection classes can be defined by clicking the Collection Classes button in the Class Properties dialog of the element</p>	<p>Element Details <small>[663]</small></p>
<p>Code Generation Precedence</p>	<p>When Enterprise Architect generates code for a connector that has a multiplicity role >1:</p> <ol style="list-style-type: none"> 1. If the Qualifier is set use the qualified collection: <ul style="list-style-type: none"> • for the Class if set • else use the code language qualified collection 2. If the Order option is set use the ordered collection: <ul style="list-style-type: none"> • for the Class if set • else use the code language ordered collection 3. Else use the default collection: <ul style="list-style-type: none"> • for the Class if set • else use the code language default collection 	
<p>Using Markers</p>	<p>You can include the marker #TYPE# in the collection name; Enterprise Architect replaces this with the name of the Class being collected at source generation time (for example, <i>Vector<#TYPE#></i> would become <i>Vector<foo></i>)</p> <p>Conversely, when reverse engineering, an Association connector is also created if a matching entry (e.g. <i>foo</i> if <i>foo</i> is found in the model) is defined as a Collection Class</p>	
<p>Additional Collection Classes</p>	<p>Additional Collection Classes can be defined in the language options page (C#, C++, Java)</p>	<p>Example Use of Collection Classes <small>[1528]</small></p> <p>C# Options <small>[1532]</small></p> <p>C++ Options <small>[1533]</small></p> <p>Java Options <small>[1535]</small></p>
<p>Member Type</p>	<p>On both the Source Role and Target Role tabs of the Association Property dialog (accessible from the right-click context menu of any Association) there is a Member Type field</p> <p>If you set this, the value you enter overrides all the above options</p>	<p>Source Role <small>[758]</small></p> <p>Target Role <small>[760]</small></p>

11.9.5.1 Example Use of Collection ClassesTopics:

Topic	Detail	See also
Example Code	<p>Consider the following source code:</p> <pre> class Class1 { public: Class1(); virtual ~Class1(); CMap<CString, LPCTSTR, Class3*, Class3*> att; Vector<Class2> *att1; TemplatedClass<class1, class2> *att2; CList<Class4> *att3; }; class Class2 { public: Class2(); virtual ~Class2(); }; class Class3 { public: Class3(); virtual ~Class3(); }; class Class4 { public: Class4(); virtual ~Class4(); }; template<class TParam1, class TParam2> class TemplatedClass { public: TemplatedClass() { } virtual ~TemplatedClass() { } }; </pre>	
Generated Diagram	<p>If this code above is imported into Enterprise Architect with default import options, the following diagram is generated:</p>	<p>C# Options ^[1532]</p> <p>Java</p>

Topic	Detail	See also
	 <p>If, however, you enter the value CList<#Type#> in the Additional Collection Classes field in the language options page (C#, Java, C++), an Association connector is also created to Class 4:</p> 	<p>Options <small>[1535]</small></p> <p>C++ Options <small>[1533]</small></p>

11.9.6 Language Options

You can set up various options for how Enterprise Architect handles a particular language when generating code. These options are accessible on the Options dialog (select the **Tools | Options** menu option).

Under the **Source Code Engineering** option, select the required language. The following topics outline the options available for each language.

Topic	Link
Action Script	ActionScript ^[1530]
Ada 2005 (in the Systems Engineering and Ultimate editions of Enterprise Architect)	Ada 2005 ^[1531]
ANSI C	ANSI C ^[1531]
C#	C# ^[1532]
C++	C++ ^[1533]
Delphi	Delphi ^[1533]
Delphi Properties	Delphi Properties ^[1534]
Java	Java ^[1535]
PHP	PHP ^[1536]
Python	Python ^[1536]
SystemC	SystemC ^[1537]
Verilog (Systems Engineering and Ultimate editions)	Verilog ^[1538]
VHDL (Systems Engineering and Ultimate editions)	VHDL ^[1538]
Visual Basic	Visual Basic ^[1539]
Visual Basic .NET	Visual Basic .NET ^[1537]
MDG Technology Languages	MDG Technology Languages ^[1540]
Reset Options	Reset Options ^[1540]

11.9.6.1 ActionScript Options

Configure options for ActionScript code generation using the ActionScript Specifications page of the Options dialog.

Access: **Tools | Options | Source Code Engineering > ActionScript**

Use to:

- Specify default ActionScript version to generate (AS2.0 or AS3.0)
- Specify default file extensions (header and source)
- Specify default source directory
- Specify the editor for ActionScript code

Reference:

Field	Usage	See also
Disable Language	Indicates that the ActionScript is to be disabled	

Options for the current model	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	
Options for the current user	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
Collection Classes	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	Collection Classes [1526]

11.9.6.2 Ada 2005 Options

Configure options for Ada 2005 code generation using the Ada page of the Options dialog.

Access: [Tools](#) | [Options](#) | [Source Code Engineering](#) > [Ada](#)

Use to:

- Inform the reverse engineering process whether the name of the Tagged Record is the same as the package name
- Advise the engine of the alternate Tagged Record name to locate
- Specify whether the engine should create a reference type for the Tagged Record (if one is not defined)
- Supply the name of the reference type to be created (default is Ref)
- To specify the reference parameter of a Reference / Access type
- Tell the engine to ignore the name of the reference parameter
- Indicate the name of the reference parameter to locate

Reference:

Field	Usage	See also
Disable Language	Indicates that Ada is to be disabled	
Options for the current model	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	
Options for the current user	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
Collection Classes	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	Collection Classes [1526]

Notes:

- Ada 2005 support is available in the System Engineering and Ultimate editions of Enterprise Architect

11.9.6.3 C Options

Configure options for C code generation using the C Specifications page of the Options dialog.

Access: [Tools](#) | [Options](#) | [Source Code Engineering](#) > [C](#)

Use to:

- Support Object Oriented coding
- Indicate default file extensions (header and source)
- Indicate default source directory
- Indicate an editor for C code
- Specify a path that Enterprise Architect uses to search for the implementation file; the first path in the list is the default path when generating

Reference:

Field	Usage	See also
Disable Language	Indicates that C is to be disabled	
Options for the current model	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	
Options for the current user	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
Collection Classes	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	Collection Classes <small>[1526]</small>

11.9.6.4 C# Options

Configure options for C# code generation using the C# Specifications page of the Options dialog.

Access: **Tools | Options | Source Code Engineering > C#**

Use to:

- Indicate the default File extension
- Indicate additional Collection Classes - to define custom collection classes, which can be simple substitutions (such as *CArray<#TYPE#>*) or a mix of other strings and substitutions (such as *Cmap<CString,LPCWSTR,#TYPE#,#TYPE#*>*); the following collection classes are defined by default:
 - *List<#TYPE#>;Stack<#TYPE#>;Queue<#TYPE#>;*
- Specify a 'Get' prefix
- Specify a 'Set' prefix
- Specify a directory for opening and saving C# source code

Reference:

Field	Usage	See also
Disable Language	Indicates that C# is to be disabled	
Options for the current model	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	

Options for the current user	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
Collection Classes	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	Collection Classes <small>[1526]</small>

11.9.6.5 C++ Options

Configure options for C++ code generation using the C++ Specifications page of the Options dialog.

Access: [Tools](#) | [Options](#) | [Source Code Engineering](#) > [C++](#)

Use to:

- Indicate the version of C++ to generate; this controls the set of templates used and how properties are created
- Specify the default reference type used when a type is specified by reference
- Specify the default file extensions
- Specify default Get/Set prefixes
- Define additional Collection Classes - to define custom collection classes, which can be simple substitutions (such as `CArray<#TYPE#>`) or a mix of other strings and substitutions (such as `Cmap<CString,LPCTSTR,#TYPE#*,#TYPE#*>`); the following collection classes are defined by default:
 - `CArray<#TYPE#>;CMap<CString,LPCTSTR,#TYPE#*,#TYPE#*>;`
- Specify a default source directory
- Specify the path that Enterprise Architect uses to search for the implementation file; the first path in the list is the default path when generating new implementation files and parsing existing files - if you add further directories, Enterprise Architect also searches these when parsing existing files

Reference:

Field	Usage	See also
Disable Language	Indicates that C++ is to be disabled	
Options for the current model	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	
Options for the current user	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
Collection Classes	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	Collection Classes <small>[1526]</small>

11.9.6.6 Delphi Options

Configure options for Delphi code generation using the Delphi Specifications page of the Options dialog

Access: [Tools](#) | [Options](#) | [Source Code Engineering](#) > [Delphi](#)

Use to:

- Indicate a default file extension
- Indicate a default source directory
- Set a default directory for opening and saving Delphi source code

Reference:

Field	Usage	See also
Disable Language	Indicates that Delphi is to be disabled	
Options for the current model	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	
Options for the current user	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
Collection Classes	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	Collection Classes

11.9.6.6.1 Delphi Properties

Enterprise Architect has comprehensive support for Delphi properties. These are implemented as Tagged Values, with a specialized property editor to help create and modify Class properties. By using the **Feature Visibility** element context menu option, you can display the 'tags' compartment that contains the properties. Imported Delphi Classes with properties have this feature automatically made visible for your convenience.

Use to:

- Configure additional properties for Delphi based elements

Reference:

Topic	Description	See also
To manually activate the property editor	<ul style="list-style-type: none"> • Ensure the Class you have selected has the code generation language set to Delphi • Right-click on the Class and select the Delphi Properties context menu option to open the editor <p>The Delphi Properties editor enables you to build properties in a simple and straightforward manner; from here you can:</p> <ul style="list-style-type: none"> • Change the name and scope (only Public and Published are currently supported) • Change the property type (the drop-down list includes all defined Classes in the project) • Set the Read and Write information (the drop-down lists have all the attributes and operations from the current 	

	Class; you can also enter free text) <ul style="list-style-type: none"> • Set Stored to True or False • Set the Implements information • Set the default value, if one exists 	
--	---	--

Notes:

- When you use the Create Property dialog from the Attribute screen, Enterprise Architect generates a pair of Get and Set functions, together with the required property definition as Tagged Values; you can manually edit these Tagged Values if required
- Public properties are displayed with a '+' symbol prefix and published with a '^'
- When creating a property in the Create Property Implementation dialog (accessed through the Attributes dialog), you can set the scope to Published if the property type is Delphi
- Only **Public** and **Published** are supported
- If you change the name of a property and forward engineer, a new property is added, but the old one must be manually deleted from the source file

11.9.6.7 Java Options

Configure options for Java code generation using the Java Specifications page of the Options dialog.

Access: **Tools | Options | Source Code Engineering > Java**

Use to:

- Set a default directory for opening and saving Java source code
- Indicate a default file extension
- Specify a default 'Get' prefix
- Specify a default 'Set' prefix
- Define additional Collection Classes - to define custom collection classes, which can be simple substitutions (such as *CArray<#TYPE#>*) or a mix of other strings and substitutions (such as *Cmap<CString,LPCTSTR,#TYPE#*,#TYPE#*>*); the following collection classes are defined by default:
 - *HashSet<#TYPE#>;Map<String,#TYPE#>;*

Reference:

Field	Usage	See also
Disable Language	Indicates that Java is to be disabled	
Options for the current model	Specifies the options used in the current model These options affect all users of the current model; however they do not apply to other models	
Options for the current user	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
Collection Classes	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	Collection Classes <small>[1528]</small>

11.9.6.8 PHP Options

Configure options for PHP code generation using the PHP Specifications page of the Options dialog.

Access: [Tools | Options | Source Code Engineering > PHP](#)

Use to:

- Specify the extension to be used when creating files for PHP source
- Define a semi-colon separated list of extensions to look at when doing a directory code import for PHP
- Set a default directory for opening and saving PHP source code
- Specify the version of PHP to generate

Reference:

Field	Usage	See also
Disable Language	Indicates that PHP is to be disabled	
Options for the current model	Specifies the options used in the current model These options affect all users of the current model; however they do not apply to other models	
Options for the current user	Specifies the options used for the current user; these options apply to all models that are accessed by the user	

Learn More:

11.9.6.9 Python Options

Configure options for Python code generation using the Python Specifications page of the Options dialog.

Access: [Tools | Options | Source Code Engineering > Python](#)

Use to:

- Indicate the default file extension(s)
- Specify the default source directory to be used
- Specify the editor used to write code

Reference:

Field	Usage	See also
Disable Language	Indicates that Python is to be disabled	
Options for the current model	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	

Options for the current user	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
-------------------------------------	--	--

11.9.6.10 SystemC Options

Configure options for SystemC code generation using the SystemC page of the Options dialog.

Access: [Tools](#) | [Options](#) | [Source Code Engineering](#) > [SystemC](#)

Use to:

- Indicate default file extension(s)
- Specify a default source directory
- Specify an editor for changing code

Reference:

Field	Usage	See also
Disable Language	Indicates that SystemC is to be disabled	
Options for the current model	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	
Options for the current user	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
Collection Classes	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	Collection Classes <small>[1526]</small>

11.9.6.11 VB.NET Options

Configure options for VB.NET code generation using the VB.NET Specifications page of the Options dialog.

Access: [Tools](#) | [Options](#) | [Source Code Engineering](#) > [VB.NET](#)

Use to:

- Indicate default file extension(s)
- Specify a default source directory
- Specify an editor for changing code

Reference:

Field	Usage	See also
Disable Language	Indicates that VB.NET is to be disabled	
Options for the	Specifies the options used in the current model	

current model	These options affect all users of the current model; however, they do not apply to other models	
Options for the current user	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
Collection Classes	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	Collection Classes <small>[1526]</small>

11.9.6.12 Verilog Options

Configure options for Verilog code generation using the Verilog page of the Options dialog.

Access: [Tools | Options | Source Code Engineering > Verilog](#)

Use to:

- Indicate default file extension(s)
- Specify a default source directory
- Specify an editor for changing code

Reference:

Field	Usage	See also
Disable Language	Indicates that Verilog is to be disabled	
Options for the current model	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	
Options for the current user	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
Collection Classes	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	Collection Classes <small>[1526]</small>

11.9.6.13 VHDL Options

Configure options for VHDL code generation using the VHDL page of the Options dialog.

Access: [Tools | Options | Source Code Engineering > VHDL](#)

Use to:

- Indicate default file extension(s)
- Specify a default source directory
- Specify an editor for changing code

Reference:

Field	Usage	See also
Disable Language	Indicates that VHDL is to be disabled	
Options for the current model	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	
Options for the current user	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
Collection Classes	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	Collection Classes <small>[1526]</small>

11.9.6.14 Visual Basic Options

Configure options for Visual Basic code generation using the VB Specifications page of the Options dialog.

Access: [Tools](#) | [Options](#) | [Source Code Engineering](#) > [Visual Basic](#)

Use to:

- Indicate the default file extension when reading/writing
- Specify the default Visual Basic version
- Indicate the MTS transaction mode for MTS objects
- Specify if a Class uses Multi use (**true** or **false**)
- Specify if a Class uses the **Persistable** property
- Indicate data binding behaviours
- Set the global namespace
- Set the *Exposed* attribute
- Indicate if the *Creatable* attribute is **true** or **false**

Reference:

Field	Usage	See also
Disable Language	Indicates that Visual Basic is to be disabled	
Options for the current model	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	
Options for the current user	Specifies the options used for the current use; these options apply to all models that are accessed by the user	
Collection Classes	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	Collection Classes <small>[1526]</small>

11.9.6.15 MDG Technology Language Options

If you have loaded an MDG Technology that specifies a code module into your *Sparx Systems > EA > MDG Technologies* folder, the language is included in the Source Code Engineering list on the Options dialog. The language is only listed on the Options dialog if an MDG Technology file actually uses it in your model.

Access: [Tools | Options | Source Code Engineering > MDG](#)

Reference:

Field	Usage	See also
Default Extension	Default extension for generated source files; shown if the option is in the technology This is saved per project	
Import File Extensions	Default folder to import source files from; shown if the technology supports namespaces This is saved once for all projects	
Generate Namespaces	Indicates if namespaces are generated or not	
Default Source Directory	The default directory to save generated source files This is always shown	
Editor	Indicates the editor that is used to edit source files	
Att Type	Indicates the default attribute type	

Notes:

- These options are set in the technology inside the `<CodeOptions>` tag of a code module, as follows:

```
<CodeOption name="DefaultExtension" >.rb</CodeOption>
```

Learn More:

- [MDG Technology](#)^[1064]

11.9.6.16 Reset Options

Enterprise Architect stores some of the options for a Class when it is first created. Some are global; for example, `$LinkClass` is stored when you first create the Class, so it won't automatically pick up the global change in the Options dialog in existing Classes. You must modify the options for the existing Class.

How To:

To modify options for a single Class, follow the steps below:

Step	Action	See also
1	Right-click on the Class to change, and select the Generate Code context menu option The Generate Code dialog displays	
2	Click on the Advanced button The Object Options dialog displays	
3	Click on the Attributes/Operations button	
4	Change the options, and click on the Close button to apply the changes	

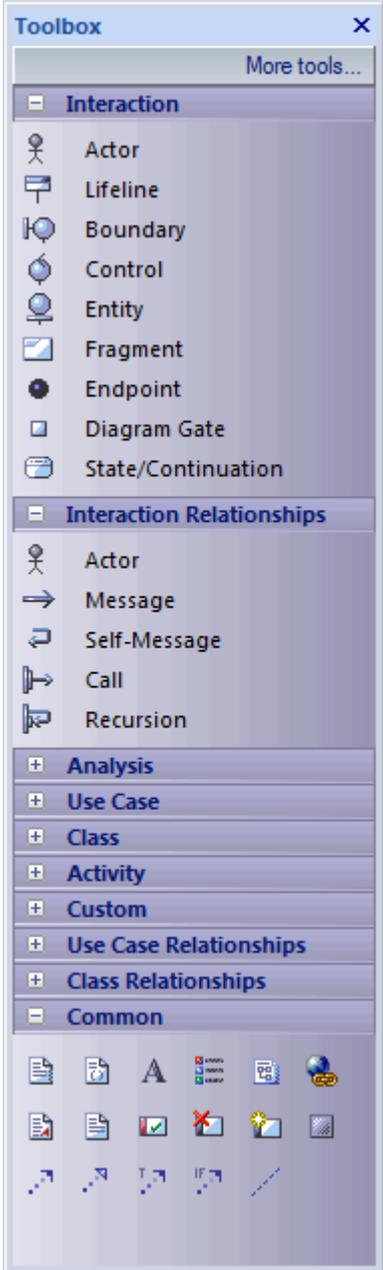

To modify options for all Classes within a package, follow the steps below:

Step	Action	See also
1	Right-click on the package in the Project Browser The context menu displays	
2	Select the Code Engineering Reset Options for this Package menu option The Manage Code Generation dialog displays	
3	Reset the required defaults for each existing Class	
4	Click on the OK button to apply the changes	

11.10 ICONIX

Topics:

Topic	Detail	See also
Abstract	<p>The following text is derived from the ICONIX entry in the online Wikipedia:</p> <p><i>The ICONIX Process is a minimalist, streamlined approach to Use Case driven UML modeling that uses a core subset of UML diagrams and techniques to provide thorough coverage of object-oriented analysis and design. Its main activity is robustness analysis, a method for bridging the gap between analysis and design. Robustness analysis reduces the ambiguity in use case descriptions, by ensuring that they are written in the context of an accompanying domain model. This process makes the use cases much easier to design, test and estimate.</i></p> <p>The ICONIX Process was developed by Doug Rosenberg; for more information on ICONIX, refer to ICONIX Software Engineering Inc.</p>	ICONIX (Online Resource)
ICONIX in Enterprise Architect	<p>Enterprise Architect enables you to develop models under ICONIX quickly and simply, through use of an MDG Technology integrated with the Enterprise Architect installer</p> <p>The ICONIX facilities are provided in the form of:</p> <ul style="list-style-type: none"> • A set of ICONIX pages in the Toolbox • ICONIX element and relationship entries in the Toolbox Shortcut Menu and Quick Linker <p>To further help you develop and manage a project under ICONIX, Enterprise Architect also provides a white paper on the ICONIX Roadmap</p> <p>In addition, Enterprise Architect has an alternative visual layout specific to ICONIX</p>	Toolbox Shortcut Menu ^[55] Quick Linker ^[62] ICONIX Roadmap (Online Resource)
ICONIX Toolbox Pages	<p>Within the Toolbox, Enterprise Architect provides ICONIX versions of the pages for UML Analysis, Use Case, Class, Interaction (Sequence), Activity and Custom diagrams (which often form the basis for <i>Robustness diagrams</i>)</p> <p>Compared to the standard Toolbox pages, these have slightly different element and relationship sets; you can access them by either:</p> <ul style="list-style-type: none"> • Selecting the More tools ICONIX <Diagram Type> menu option for a specific Toolbox page • Selecting the ICONIX option in the drop-down field of the Default Tools toolbar, which adds all six pages to the Toolbox; the first page and the Common page are expanded, and the others are closed up 	Analysis Diagram ^[118] Use Case Diagram ^[81] Class Diagram ^[79] Sequence Diagram ^[84] Activity Diagram ^[81] Custom Diagram ^[118]

12 Systems Engineering

Topics:

Topic	Detail	See also
Usage	<p>To model Systems using SysML in Enterprise Architect, you work through the following steps:</p> <ul style="list-style-type: none"> • Create a Systems Engineering model to develop your system • Create a Requirements model to define the systems requirements and expectations • Create an Operational Domain model, which describes the environment that the system operates within, and the entities it interacts with • Create Constraint models to describe the systems operating characteristics using parametric models • Simulate the parametric models to verify their correctness and obtain the desired characteristic • Design the system's composition using SysML Blocks and Parts • Implement the embedded software using UML Classes and behavioral models • Create a Library of reusable SysML blocks, representing subsystems that can be reused on other projects, and other common Type definitions 	<p>SysML ^[1552]</p> <p>Create a Systems Engineering model ^[1549]</p> <p>Create a Requirements model ^[1572]</p> <p>Create an Operational Domain model ^[1573]</p> <p>SysML Parametric Models ^[1568]</p> <p>Simulating a SysML Model ^[1570]</p> <p>Compose System Design ^[1575]</p> <p>Generate from Behaviour Models ^[1496]</p> <p>Create Re-usable Subsystems ^[1577]</p>

Example:

These steps are represented graphically in the following flow:

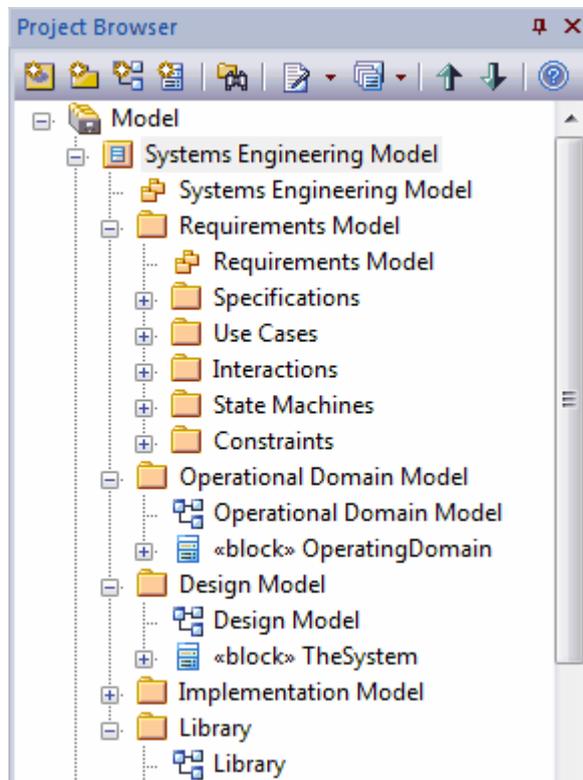

To create a Systems Engineering Model from a template provided with Enterprise Architect, follow the steps below

How To:

Step	Action	See Also
1.	In the Project Browser , either: <ul style="list-style-type: none"> Click on the New Model From Pattern icon in the toolbar Right-click on a model root node and select the Add a New Model using Wizard context menu option, or Right-click on a package and select the Add Add a New Model using Wizard context menu option. The Select Model(s) dialog displays.	
2.	In the Select From field, click on the drop-down arrow and select Systems Engineering Model . Alternatively, if it is listed in the Technology panel, select the Systems Engineering Model item.	
3.	In the Name panel, select the checkbox next to the Systems Engineering Model icon.	
4.	Click on the OK button.	

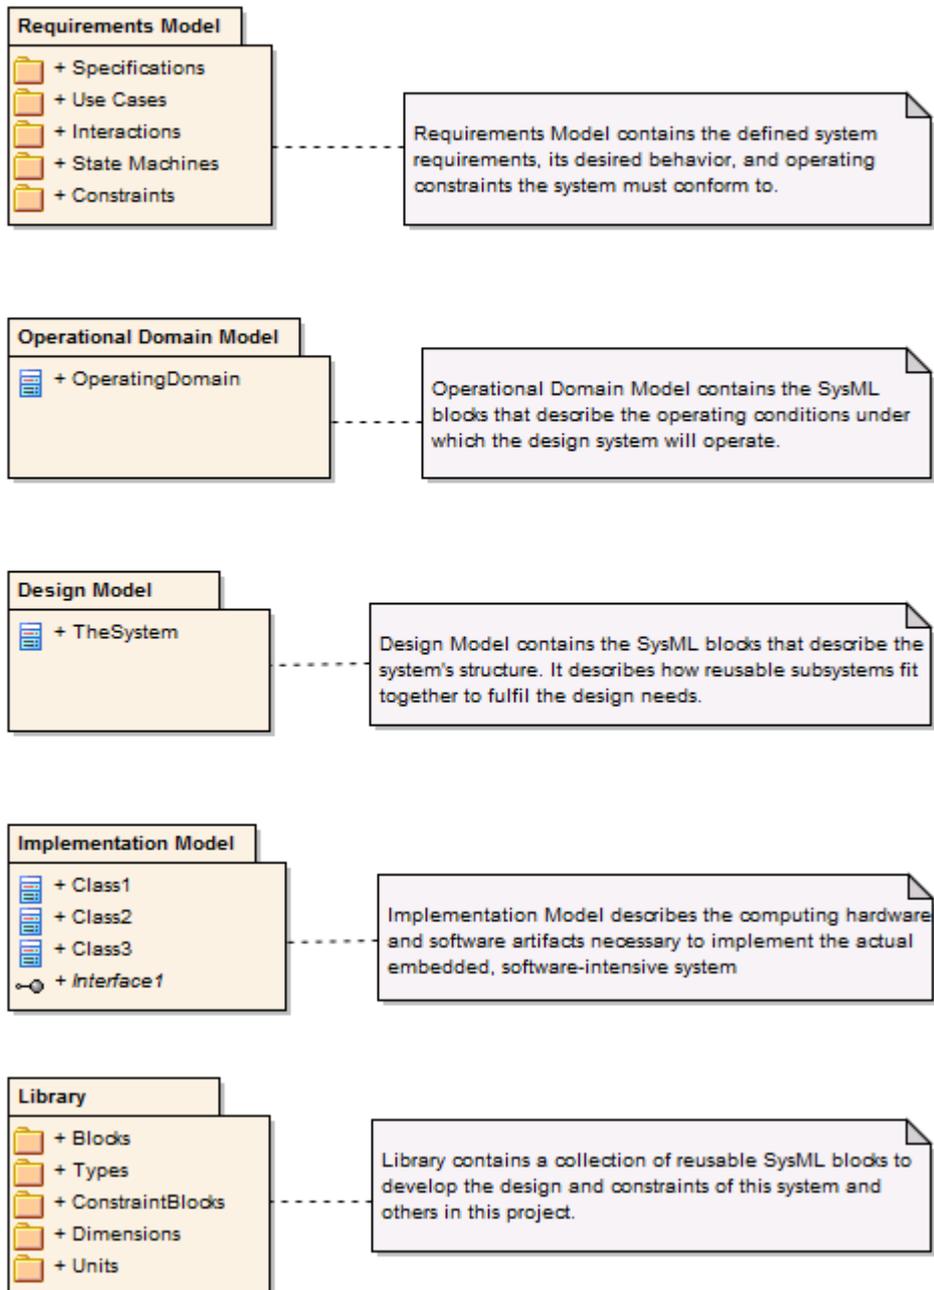

Example:

The following model structure is created in the **Project Browser**:

The *Systems Engineering Model* diagram, shown below, encapsulates the key components of the Systems Engineering model.

Systems Engineering Model captures the requirements, operating conditions and performance constraints of a complex system. It captures the design of the system in terms of distinct, configurable, reusable subsystem components.

Notes:

- Systems Modeling Language (SysML) is available in the Systems Engineering edition and Ultimate edition of Enterprise Architect

12.1 SysML

Topics:

Topic	Detail	See also
Introduction	<p>The following text is derived from the official OMG SysML site of the Object Management Group</p> <p><i>The OMG Systems Modeling Language (OMG SysML™) is a general-purpose graphical modeling language for specifying, analyzing, designing, and verifying complex systems that may include hardware, software, information, personnel, procedures, and facilities.</i></p> <p><i>The language provides graphical representations with a semantic foundation for modeling system requirements, behavior, structure, and parametrics, which is used to integrate with other engineering analysis models.</i></p> <p><i>SysML was developed in response to requirements developed jointly by the OMG and the International Council on Systems Engineering (INCOSE) by the diverse group of tool vendors, end users, academia, and government representatives.</i></p>	OMG SysML
SysML In Enterprise Architect	<p>Enterprise Architect enables you to develop SysML models quickly and simply, through use of an MDG Technology integrated with the Enterprise Architect installer</p> <p>The SysML technology provides:</p> <ul style="list-style-type: none"> • Each of the nine SysML diagram types, accessed through the New Diagram dialog • A collection of SysML pages in the Toolbox that contain each of the supported SysML elements and relationships • SysML element and relationship entries in the Toolbox Shortcut Menu and Quick Linker • Simulation of SysML Parametric diagrams, which supports engineering analysis of critical system parameters including the evaluation of key metrics such as performance, reliability and other physical characteristics 	Add New Diagram ^[568] Toolbox Shortcut Menu ^[551] Quick Linker ^[622] Simulate a SysML Model ^[1570]
SysML Toolboxes	<p>You can access the SysML pages of the Toolbox through the More tools SysML 1.1 and SysML 1.2 menu options</p> <p>You can also enable SysML as the active technology to access the Toolbox pages directly</p> <p>The following sets of Toolbox pages are available:</p> <ul style="list-style-type: none"> • Model Elements contains the constructs required to build SysML models, package structures and views • Block Definition contains the constructs required to design SysML blocks, constraint blocks, data and value types • Internal Block contains the constructs required 	Model Elements ^[1561] Block Definition ^[1556] Internal Block ^[1559] Parametrics ^[1563] Activity ^[1553] Interaction ^[1558] State Machine ^[1565] Use Case ^[1567] Requirements ^[1564] Default Tools Toolbar ^[107]

Disable SysML	If you prefer not to use SysML in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (Settings MDG Technologies)	MDG Technologies ^[1033]

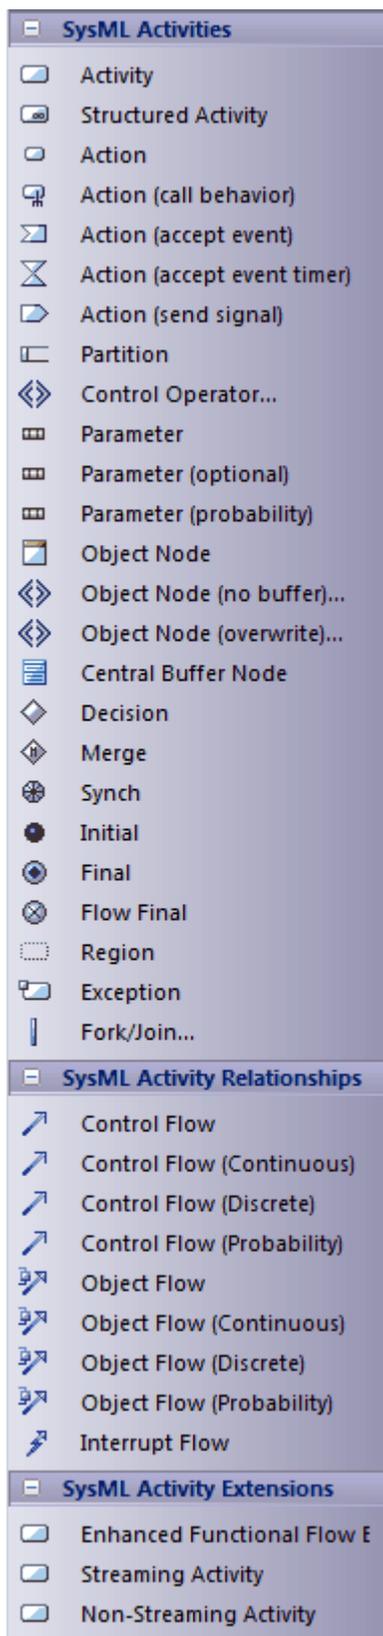

Notes:

- Systems Modeling Language (SysML) is supported in the Systems Engineering and Ultimate editions of Enterprise Architect

12.1.1 SysML Activity

These pages provide the SysML elements to construct SysML Activity models.

Access: [View | Diagram Toolbox: More Tools | SysML 1.2 | SysML 1.2 Activity](#)

Page	Item	Action
SysML Activities	Activity	Define a SysML Block of executable behavior as a UML Activity

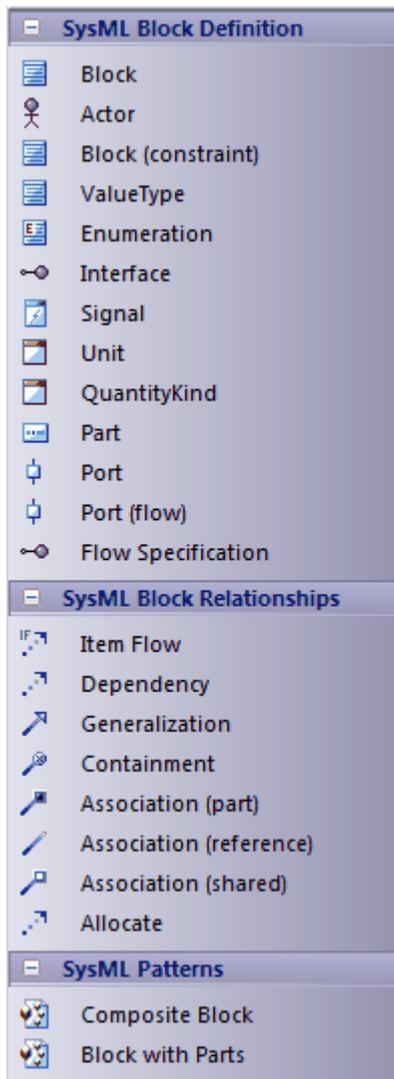

Page	Item	Action
	Structured Activity	Define a SysML Block of executable behavior as a UML Structured Activity
	Action	Declare a unit of execution in an Activity as a UML Action.
	Action (call behavior)	Declare a unit of execution that calls another behavior
	Action (accept event)	Declare a unit of execution that accepts an event raised by the system
	Action (accept event timer)	Declare a unit of execution that accepts an event raised by a time epoch
	Action (send signal)	Declare a unit of execution that sends a signal as an event
	Partition	Create an Activity Partition to group execution elements together by the node responsible for their execution
	Control Operator	Control the execution of an Activity
	Parameter	Provide access to input and output objects within the Activity
	Parameter (optional)	Define a parameter whose contents are optional in the Activity's execution
	Parameter (probability)	Tag a parameter with probability of the likelihood of the parameter's use in the Activity
	Object Node	Declare a variable in the Activity, typed by a ValueType, DataType or Block
	Object Node (no buffer)	Declare an ObjectNode in an Activity which discards unconsumed tokens
	Object Node (overwrite)	Declare an ObjectNode in an Activity which overwrites tokens
	Central Buffer Node	Declare an ObjectNode that stores tokens for consumption throughout the Activity
	Decision	Create a branch of control in an Activity based on a decision
	Merge	Merge two or more Activity control branches together
	Synch	Establish a rendezvous point for two or more Activity flows, in order to synchronize their execution in the Activity
	Initial	Declare the start of Activity's execution
	Final	Declare the end of an Activity's execution, and the termination of the Activity
	Flow Final	Declare the end of an Activity's execution path without terminating the Activity
	Region	Group a subset of an Activity into a common execution context
	Exception	Declare a node of execution that happens outside the normal flow of execution of an Activity
	Fork/Join	Simultaneously branch / join a set of Control or Object Flows

Page	Item	Action
SysML Activity Relationships	Control Flow	Establish a flow of logic between two Activity nodes
	Control Flow (Continuous)	Declare a continuous control flow
	Control Flow (Discrete)	Declare a discrete control flow
	Control Flow (Probability)	Tag a control flow with a probability of the likelihood of the flow's traversal
	Object Flow	Establish a flow of objects (data) between two Activity nodes
	Object Flow (Continuous)	Declare a continuous object flow
	Object Flow (Discrete)	Declare a discrete object flow
	Object Flow (Probability)	Tag an object flow with a probability of the likelihood of the flow's traversal
	Interrupt Flow	Declare a control flow that interrupts flow within a Region
SysML Activity Extensions	Enhanced Functional Flow Block Diagrams	Declare an Activity used to contain an Enhanced Functional Flow Block Diagram (EFFBD)
	Streaming Activity	Declare an Activity where the flow of tokens passes through its parameters continuously throughout the Activity's execution
	Non-Streaming Activity	Declare an Activity where the flow of tokens passes through its parameters at the start of the Activity's execution

12.1.2 SysML Block Definition

These pages provide the SysML elements to design SysML blocks, constraint blocks, data and value types.

Access: [View](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.2](#) | [SysML 1.2 Block Definition](#)

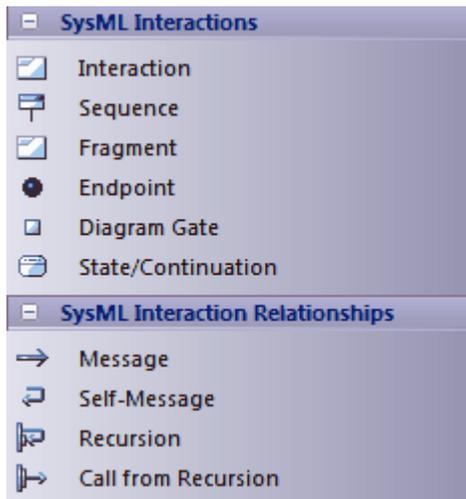

Page	Item	Action
SysML Block Definition	Block	Define a composite system entity in SysML
	Actor	Represent a user that interacts with one or more SysML systems
	Block (constraint)	Define a composite constraint as a system of parametric equations
	ValueType	Define a SysML quantity, expressed as a measurable dimension with specific units
	Enumeration	Define a data type as a set of symbols or values
	Interface	Define an element that describes a specification of an interaction point with properties and methods
	Signal	Define a SysML message, containing attributes, exchanged between system blocks in an interaction
	Unit	Represent a standard unit of measure in SysML

Page	Item	Action
	QuantityKind	Identify a measurable quantity in SysML
	Part	Describe the decomposition of a SysML Block subsystem in the context of its whole using instances of reusable SysML Blocks
	Port	Describe a structural interaction point of a SysML Block which, in turn, connects between interacting parts of a block
	Port (flow)	Describe what flows in and out of interacting SysML Blocks
	Flow Specification	Define a set of flow properties that correspond to individual pieces of a common interaction point
SysML Block Relationships	Item Flow	Specify the items that flow across a connector in an interaction point
	Dependency	Establish a traceable relationship describing how one element is dependant upon another
	Generalization	Describe an element as a specialized descendant of another element, containing additional properties and behavior
	Containment	Graphically display ownership of one element within a parent element
	Association (part)	Describe the characteristics of a connection between a SysML Block and its internal parts, such as the multiplicity and type
	Association (reference)	Describe the characteristics of a connection between separate SysML Blocks, such as the multiplicity and type
	Association (shared)	Describe the characteristics of a common connection between SysML Blocks, such as the multiplicity and type
	Allocate	Relate model elements together to formalize a refinement of behavior, structure, constraints or design expectations
SysML Patterns	Composite Block	A pattern that creates a Composite Block made up of Blocks related by Aggregation relationships
	Block with Parts	A pattern that creates a Composite Block made up of nested parts

12.1.3 SysML Interaction

These pages provide the SysML elements to construct SysML interactions and Sequence diagrams.

Access: [View](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.2](#) | [SysML1.2 Interaction](#)

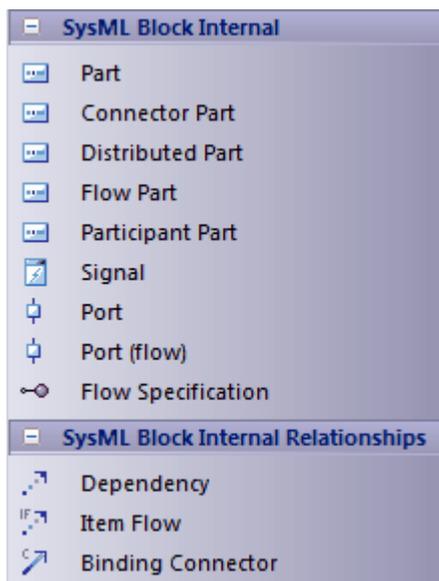

Page	Item	Action
SysML Interactions	Interaction	Define a SysML Block of executable behavior as a UML Interaction
	Sequence	Reference an instance of a SysML Block as a Lifeline in the Interaction
	Fragment	Declare a portion of an interaction as a group with specific behavior semantics
	Endpoint	Create an exit point for the Interaction
	Diagram Gate	Create an endpoint for the interaction, which bridges between nested interactions
	State/Continuation	Constrain the Interaction with assertions of the state that the lifeline is expected to be in
SysML Interactions Relationships	Message	Describe a message exchange between two lifelines in an Interaction
	Self-Message	Describe a message exchange between a lifeline and itself in an Interaction
	Recursion	Describe a recursive message exchange between a lifeline and itself in an Interaction
	Call from Recursion	Describe a message exchange between two lifelines within a recursive exchange

12.1.4 SysML Internal Block

These pages provide the SysML elements to design SysML block compositions within Internal Block Diagrams.

Access: [View](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.2](#) | [SysML 1.2 Internal Block](#)

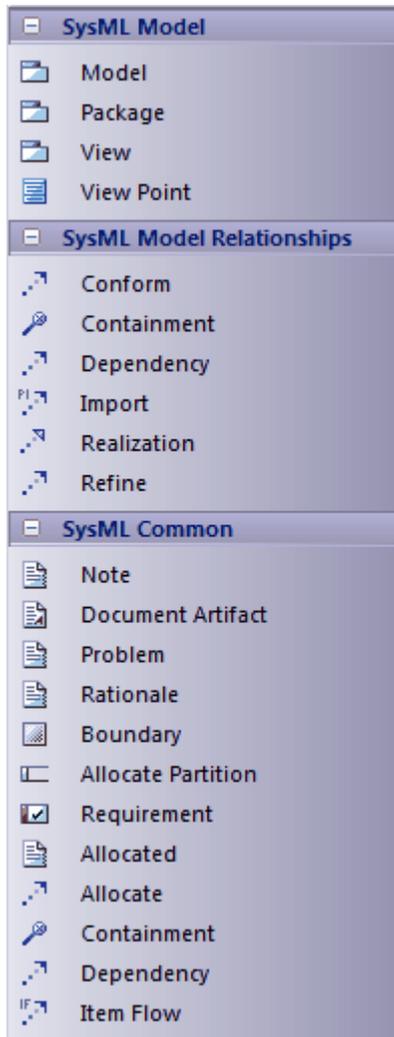

Page	Item	Action
SysML Block Internal	Part	Describe the decomposition of a SysML Block subsystem in the context of its whole, using instances of reusable SysML Blocks
	Connector Part	Create a SysML connector part
	Distributed Part	Create a SysML distributed part
	Flow Part	Create a SysML flow part
	Participant Part	Create a SysML participant part
	Signal	Define a SysML message, containing attributes, exchanged between system blocks in an interaction
	Port	Describe a structural interaction point of a SysML Block which, in turn, connects between interacting parts of a block
	Port (flow)	Describe what flows in and out of interacting SysML Blocks
	Flow Specification	Define a set of flow properties that correspond to individual pieces of a common interaction point
SysML Block Internal Relationships	Dependency	Establish a traceable relationship describing how one element is dependant upon another
	Item Flow	Specify the items that flow across a connector in an interaction point
	Binding Connector	Establish a connection between two parts in a system decomposition

12.1.5 SysML Model Elements

These pages provide the SysML elements to build SysML models, package structures and views.

Access: [View](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.2](#) | [SysML 1.2 Model Elements](#)

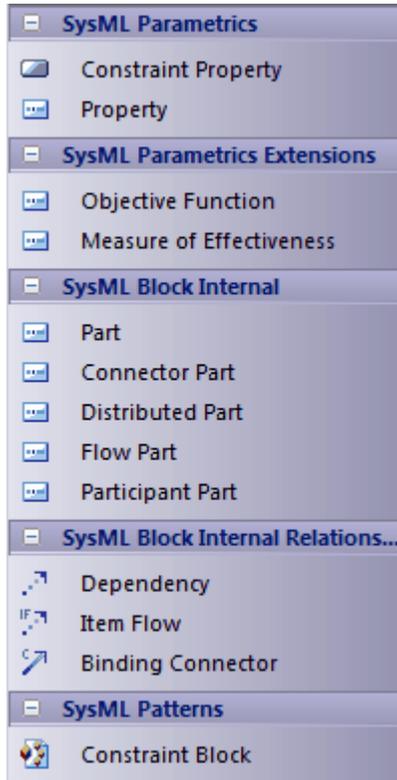

Page	Item	Action
SysML Model	Model	Create a Package containing a SysML Model
	Package	Group model constructs together in a single unit of containment
	View	Create a stereotyped Package that defines a SysML View of a system, from the perspective of a SysML View Point
	View Point	Create a stereotyped Class that defines a SysML View Point, which specifies the rules and conventions for the construction and use of Views
SysML Model Relationships	Conform	Establish a conformance dependency of a View to the defining View Point

Page	Item	Action
	Containment	Graphically display ownership of one element within a parent one
	Dependency	Establish a traceable relationship describing how one element is dependant upon another
	Import	Represent a reuse of elements from one model package in another
	Realization	Identify a design fulfillment of a specification between elements
	Refine	Represent a refinement of one element by another
SysML Common	Note	Create a textual annotation that can be attached to a set of elements of any other type The attachment is created separately, using a Notelink connector
	Document Artifact	Attach a linked document to the diagram by associating this element with an RTF document
	Problem	Document the failure of model elements to satisfy a requirement
	Rationale	Document the justification for decisions
	Boundary	Define a conceptual boundary, to visually group logically related elements
	Allocate Partition	Contains elements deemed to be allocated to the classifier of the partition
	Requirement	Specify the capabilities of the system, or the conditions that it should satisfy
	Allocated	The source element being allocated to the target element in an Allocate relationship
	Allocate	Relate model elements to formalize a refinement of behavior, structure, constraints or design expectations The Allocate relationship points from the element being allocated to the element that is the target of the allocation
	Containment	Graphically display ownership of one element within a parent one
	Dependency	Establish a traceable relationship describing how one element is dependant upon another
	Item Flow	Specify the items that flow across a connector in an interaction point.

12.1.6 SysML Parametrics

These pages provide the SysML elements to construct SysML Parametric Diagrams using constraint blocks.

Access: [View | Diagram Toolbox: More Tools | SysML 1.2 | SysML 1.2 Parametrics](#)

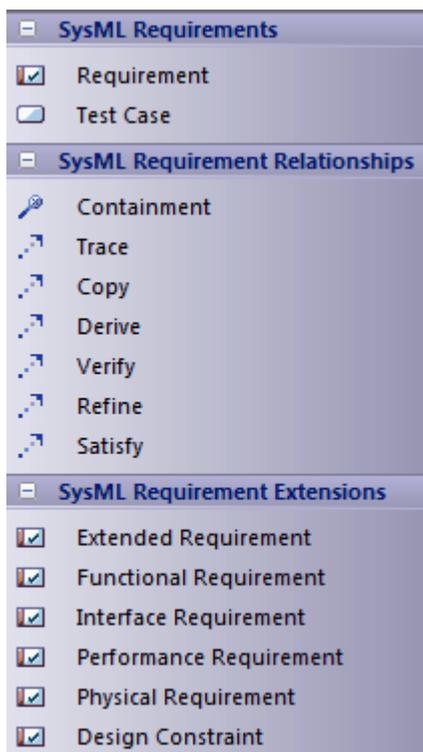

Page	Item	Action
SysML Parametrics	Constraint Property	Instantiate a Constraint Block for use in a Parametric diagram
	Property	Define a SysML property typed by a DataType, ValueType or Block
SysML Parametrics Extensions	Objective Function	Define a SysML Constraint Block for use as an objective function to evaluate Measures of Effectiveness (MOEs)
	Measure of Effectiveness	Define a SysML property for use as a Measure of Effectiveness (MOE)
SysML Block Internal	Part	Describe the decomposition of a SysML Block subsystem in the context of its whole, using instances of reusable SysML Blocks
	Connector Part	Create a SysML connector Part
	Distributed Part	Create a SysML distributed Part
	Flow Part	Create a SysML flow Part
	Participant Part	Create a SysML participant Part

Page	Item	Action
SysML Block Internal Relationships	Dependency	Establish a traceable relationship describing how one element is dependant upon another
	Item Flow	Specify the items that flow across a connector in an interaction point
	Binding Connector	Establish a connection between two Parts in a system decomposition
SysML Patterns	Constraint Block	A pattern that creates a typical Constraint property that owns two Parts

12.1.7 SysML Requirements

These pages provide the SysML elements to build SysML Requirements models.

Access: [View](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.2](#) | [SysML 1.1 Requirements](#)

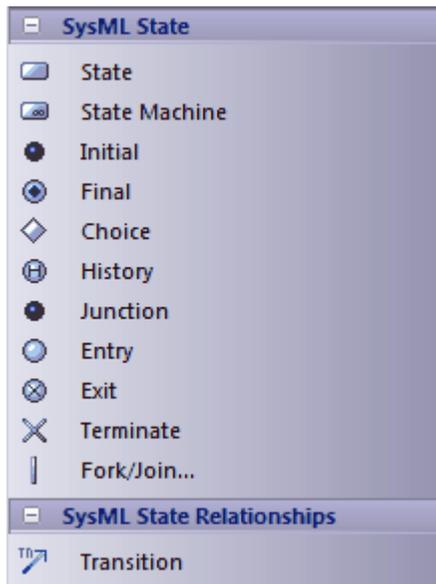

Page	Item	Action
SysML Requirements	Requirement	Specify the capabilities of the system, or the conditions that it should satisfy
	Test Case	Describe the verification of a Requirement through methods of inspection, analysis, demonstration or testing
SysML Requirement	Containment	Graphically display ownership of one element within a parent element

Page	Item	Action
	Trace	Declare a trace relationship between a SysML Requirement and another SysML element
	Copy	Declare a copy of one SysML Requirement by another
	Derive	Derive a SysML Requirement from another
	Verify	Declare a verification of a SysML Requirement by another SysML element
	Refine	Declare a refinement of a SysML Requirement by another SysML element
	Satisfy	Declare that the SysML Requirement is satisfied by another SysML element
SysML Requirement Extensions	Extended Requirement	Extend a SysML Requirement with additional Tag properties
	Functional Requirement	Declare a SysML Requirement that describes the operation, or behavior, that the system must perform
	Interface Requirement	Declare a SysML Requirement that describes how the system connects, or interfaces with, other systems
	Performance Requirement	Declare a SysML Requirement that describes how the system performs against defined capabilities or conditions
	Physical Requirement	Declare a SysML Requirement that describes the physical characteristics, or physical constraints, of the system
	Design Requirement	Declare a SysML Requirement that specifies a constraint on the implementation of the system

12.1.8 SysML State Machine

These pages provide the SysML elements to build SysML State Machines.

Access: [View](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.2](#) | [SysML 1.2 State Machine](#)

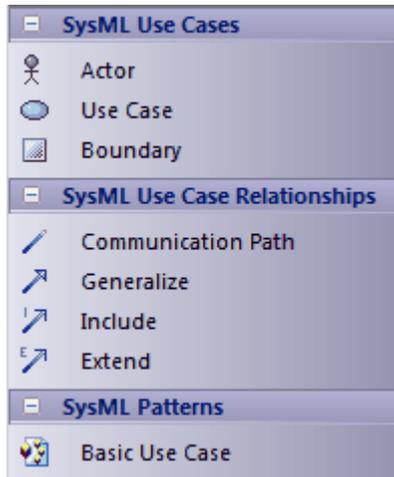

Page	Item	Action
SysML State	State	Declare a significant condition in the life of a SysML Block within its State Machine
	State Machine	Describe the life-cycle behavior of a SysML Block in terms of its states and transitions
	Initial	Declare the starting state of the State Machine
	Final	Declare the ending state of the State Machine, and its completion
	Choice	Declare a Junction with a mandatory 'else' transition
	History	Represent the last active State of the State Machine prior to its interruption
	Junction	Declare a decision point at which a Transition branches out into multiple guarded, alternative paths
	Entry	Declare an Entry point between State Machines, Substate Machines and Regions
	Exit	Declare an Exit point between State Machines, Substate Machines and Regions
	Terminate	Declare a termination State in which the State Machine no longer operates
	Fork/Join	Simultaneously branch / join a set of Transitions
SysML State Relationships	Transition	Establish a life-cycle path between one State and another, based on its operational conditions

12.1.9 SysML Use Case

These pages provide the SysML elements to build SysML Use Case models.

Access: [View](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.2](#) | [SysML 1.2 Use Cases](#)

Page	Item	Action
SysML Use Cases	Actor	Represent a user that interacts with one or more SysML systems
	Use Case	Describe the expected functionality of a system as a UML Use Case
	Boundary	Graphically bound elements in a diagram with a border
SysML Use Case Relationships	Communication Path	Declare which Actors perform in the Use Case
	Generalize	Describe an element as a specialized descendant of another element, containing additional properties and behavior
	Include	Describe one Use Case as a subset of another
	Extend	Describe one Use Case as an extension of another
SysML Patterns	Basic Use Case	A pattern that creates a typical simple Use Case diagram of Actor, Use Case and System Boundary

12.2 SysML Parametric Models

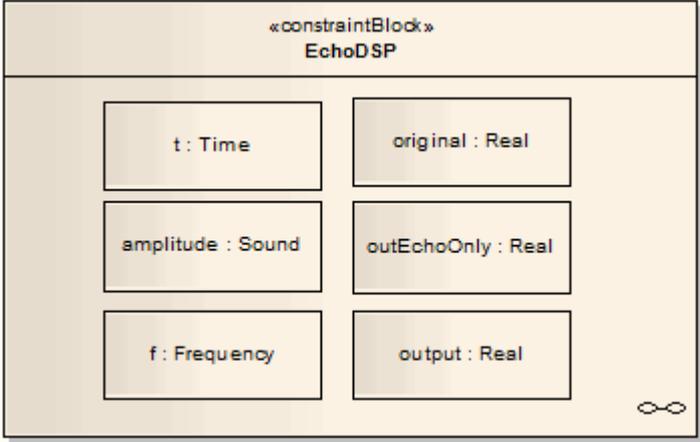

SysML Parametric models support the engineering analysis of critical system parameters, including the evaluation of key metrics such as performance, reliability and other physical characteristics.

Topics:

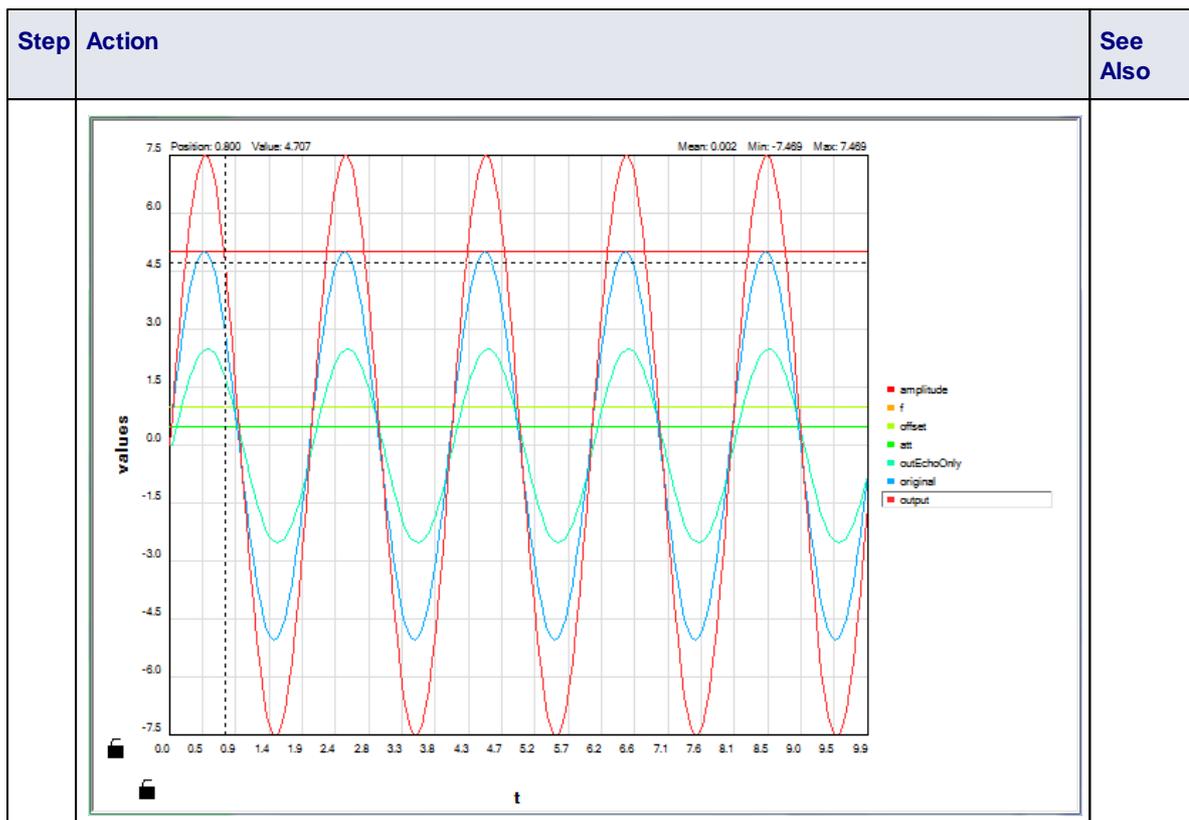

Topic	Detail	See also
SysML Parametric Models - Concept	<p>SysML Parametric Models unite requirements models with system design models by capturing executable constraints based on complex mathematical relationships</p> <p>The following text is derived from the SysML entry in the online Wikipedia</p> <p><i>The advantages of SysML over UML for systems engineering become obvious if you consider a concrete example, such as modeling an automotive system. With SysML you can use Parametric diagrams to precisely define performance and mechanical constraints such as maximum acceleration, curb weight, air conditioning capacity, and interior cabin noise management.</i></p> <p>For further information on the concepts of SysML Parametric models, refer to the official OMG SysML website and its linked sources</p> <p>Enterprise Architect enables you to develop SysML Parametric models quickly and simply; these models can also be simulated</p>	<p>SysML (Online Resource)</p> <p>OMG SysML (Online Resource)</p>

How To:

To create a Parametric model, follow the steps below:

Step	Action	See Also
1	<p>Create a collection of <i>SysML Constraint Blocks</i> that formally describe the function of a constraint in a simulation model</p> <p>Each Constraint Block contains properties that describe its input and output parameters, as well as <i>Element Script</i> that describes the constraint's executable component</p> 	
2	Right-click on each of the <i>constraintBlocks</i> and select the SysML Add Element Script	

Step	Action	See Also
	<p>context menu option to add script to the constraint block</p> <p>This is where you express the relationship / behavior of the constraint block as an executable script</p>	
<p>3</p>	<p>Create a SysML Constraint Block to contain the Parametric model to simulate; the Parametric model contains properties and occurrences of constraint blocks as Constraint Property elements, connected in a Parametric Diagram</p>	
<p>4</p>	<p>Right-click within a Parametric Diagram and select the SysML Simulate Diagram... context menu option</p>	
<p>5</p>	<p>Depending on your configuration selections, the simulation's results are either written to a comma-separated CSV file or graphed in a 2-dimensional plot</p>	

**Notes:**

- Systems Modeling Language (SysML) is supported in the Systems Engineering and Ultimate editions of Enterprise Architect

Learn More:

- [SysML](#)^[1552]
- [Simulating a SysML Model](#)^[1570]

12.2.1 Simulate a SysML Model

You simulate a SysML model from a Parametric diagram, using the Simulation Configuration dialog.

Access: **Parametric Diagram Context Menu | SysML | Simulate Diagram..**

How To:

To simulate a SysML model, follow the steps below:

Step	Action	See Also
1	<p>The Parameters panel lists all of the parameters that can be assigned input</p> <p>Select each of the required parameters and click on the right Arrow button to assign them as input</p> <p>Parameters designated as input parameters are listed in the Inputs panel on the right.</p>	

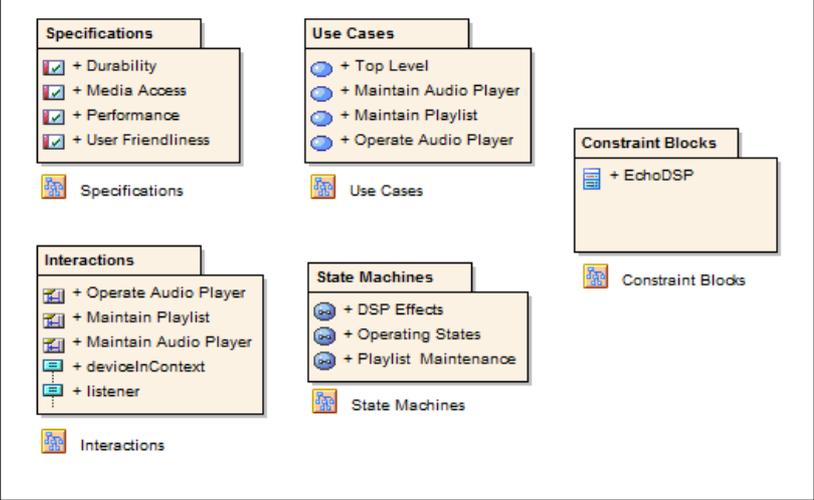

Step	Action	See Also
	There must be at least one input parameter assigned for the simulation to execute	
2	Assign a set of values for each of the designated input parameters For each input parameter, in the Input Values panel select one of the two possible value kinds: <ul style="list-style-type: none"> • Discrete - To enter a constant or a comma-separated range of discrete values • Range - To enter a range of values beginning at the From value and ending at the To value; the input values are incremented by the Step value 	
3	Specify the classes of output value: <ul style="list-style-type: none"> • Parameters - To output the parameters' data, select the checkbox • Variables - To output the data generated within each internal variable, select the checkbox; internal variables are automatically generated by the simulator 	
4	Specify how the simulation results are to be reported The Output Format panel enables you to choose how the simulation outputs the simulation data: <ul style="list-style-type: none"> • Plot To Graph: To plot the results on a 2-dimensional graph, select the checkbox; if you select this option, you must specify an input parameter for the plot's X Axis • Title - To enter a title for the graph, type in the title text • Output to File - To output the results to a CSV text file, select the checkbox and type or browse (...) for the file name 	
5	Click on the OK button to execute the simulation	

Notes:

- Systems Modeling Language (SysML) is supported in the Systems Engineering and Ultimate editions of Enterprise Architect

12.3 Create a Requirements Model

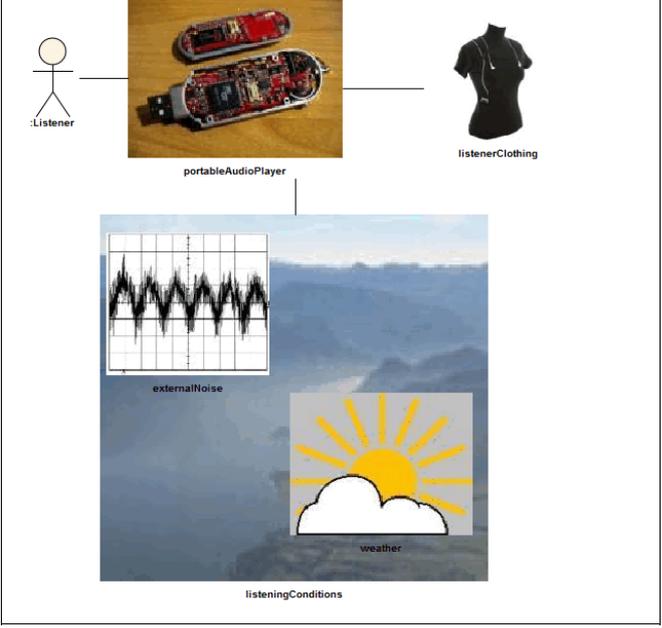

Topics:

Topic	Detail	See also
<p>Example</p>	<p>The SysML <i>Requirements Model</i> provides the system requirements, the expected abstract behavior and the operating constraints that the designed system must conform to</p> <p>The following diagram shows an example requirements model for a <i>Portable Audio Player</i></p>  <p>In the example Requirements Model, each of the child packages contains child models that capture the following aspects of the system's requirements:</p> <ul style="list-style-type: none"> • The <i>Specifications</i> package contains SysML Requirements describing the overall expectations of the designed system • The <i>Use Cases</i> package contains SysML Use Cases that describe the general interaction between the system and its users • The <i>Interactions</i> package contains SysML Interactions that describe a detailed sequence of interactions between the system and its users • The <i>State Machines</i> package contains SysML State Machines that describe each of the operational states the designed system has • The <i>Constraint Blocks</i> package contains SysML ConstraintBlocks that describe the expected performance and operating boundaries of the system 	

12.4 Create an Operational Domain Model

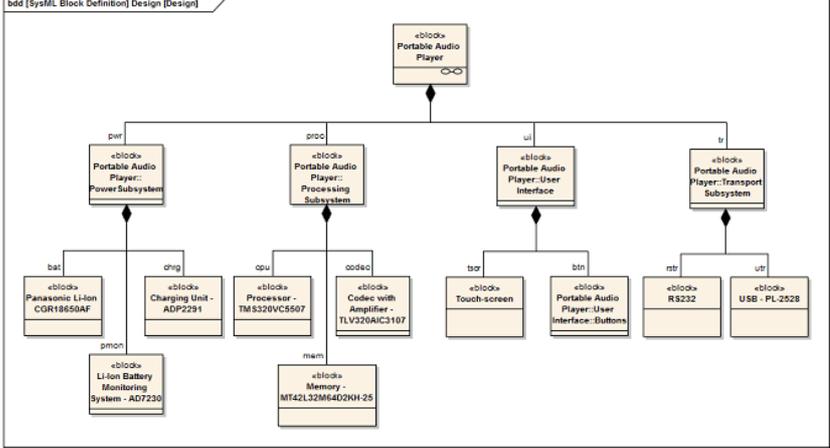

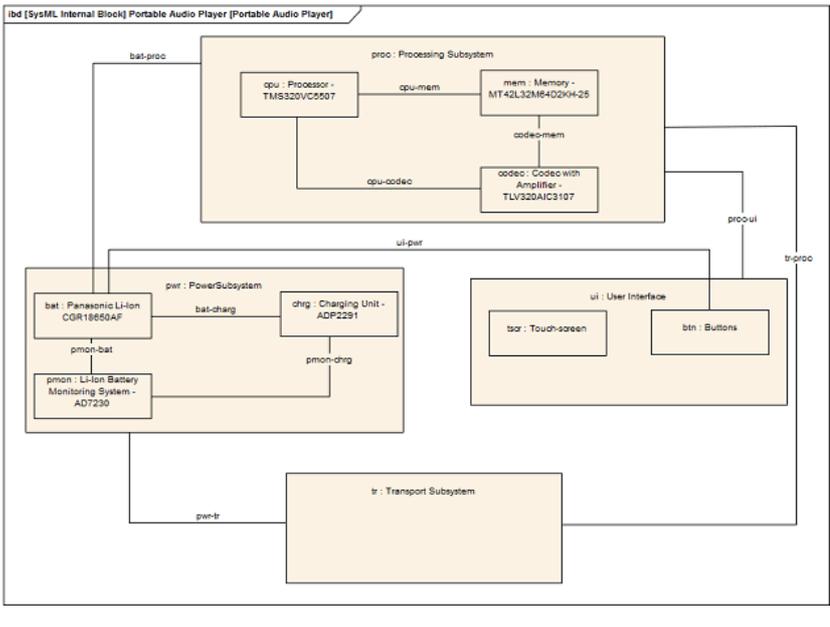

Topics:

Topic	Detail	See also
<p>Abstract</p>	<p>The SysML <i>Operational Domain Model</i> defines the system's operating environment, which describes the operating conditions that the system is intended to operate within</p> <p>The following diagram shows an example Operational Domain model for a <i>Portable Audio Player</i>; the SysML Block Definition Diagram describes the Operational Domain (in this example - the <i>ListeningDomain</i>) as a system composition</p> <div data-bbox="507 752 1166 1249" data-label="Diagram"> <pre> graph TD subgraph "bdd [SysML Block Definition] Listening Domain [Listening Domain]" LPD[«block» ListeningDomain] LAP[«block» Portable Audio Player] C[«block» Clothing] E[«block» Environment] EN[«block» Environment: Noise] EW[«block» Environment: Weather] L[Listener] LPD --> LAP LPD --> C LPD --> E E --> EN E --> EW L -.- LAP end </pre> </div> <p>In this example, the <i>ListeningDomain</i> is defined as a system containing other subsystems within it; the domain contains subsystems that define the Listener (i.e. User), the Portable Audio Player, Clothing (which the user wears), and the External Environment</p> <p>Details of the <i>ListeningDomain</i> system are further detailed in the <i>ListeningDomain</i>'s Internal Block Diagram:</p>	

Topic	Detail	See also
	<p data-bbox="507 320 850 342">ibd [SysML Internal Block] ListeningDomain [ListeningDomain]</p>  <p>The diagram shows an internal block definition for 'ListeningDomain'. It contains four components: a stick figure labeled ':Listener', a photograph of a portable audio player labeled 'portableAudioPlayer', a black t-shirt labeled 'listenerClothing', and a landscape image with a sun and clouds labeled 'listeningConditions'. The 'listeningConditions' block contains a waveform labeled 'externalNoise' and a sun icon labeled 'weather'. Lines connect the 'Listener' to the 'portableAudioPlayer', and the 'portableAudioPlayer' to the 'listenerClothing' and 'listeningConditions' blocks.</p> <p data-bbox="507 1003 1169 1167">In this example, the <i>ListeningDomain's</i> system's detailed composition shows how the Portable Audio Player and other sub-systems fit together to form the Listening Domain; it also describes the binding relationships between the parts, which describe how the parts are functionally bound to one another</p>	

12.5 Compose System Design

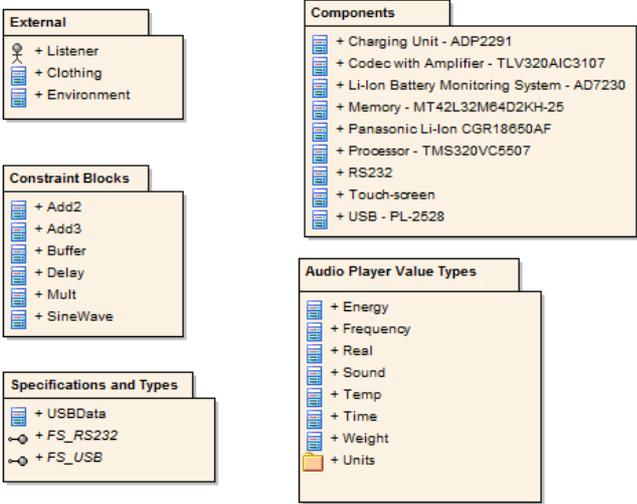

Topics:

Topic	Detail	See also
<p>SysML Design Model</p>	<p>The <i>SysML Design Model</i> contains the blocks that define the system's composition; it describes the manner in which reusable subsystems fit together to fulfill the design requirements</p> <p>The following diagram shows an example Design Model for a <i>Portable Audio Player</i>; the <i>SysML Block Definition Diagram</i> describes the <i>Portable Audio Player</i> as a composition of various reusable off-the-shelf subsystems and in-house designed ones</p>  <p>The diagram is a SysML Block Definition Diagram (bdd) titled "[SysML Block Definition] Design [Design]". It shows a hierarchical structure of blocks. At the top is the "Portable Audio Player" block. Below it are four main subsystems: "Power Subsystem", "Processing Subsystem", "User Interface", and "Transport Subsystem". Each subsystem is further decomposed into specific hardware and software components. For example, the Power Subsystem includes a battery, charging unit, and battery monitoring system. The Processing Subsystem includes a processor, memory, and audio codec. The User Interface includes a touch-screen and buttons. The Transport Subsystem includes RS232 and USB ports.</p> <p>In the example above, the <i>Portable Audio Player</i> is defined as a SysML system containing subsystems that perform specific tasks; the design contains subsystems for supplying power, performing playback and audio processing, interfacing with other devices and the user interface</p> <p>Details of the <i>Portable Audio Player's</i> composition are further described in detail within the <i>Portable Audio Player's Internal Block Diagram</i>:</p>  <p>The diagram is a SysML Internal Block Diagram (ibd) titled "[SysML Internal Block] Portable Audio Player [Portable Audio Player]". It shows the internal composition of the Portable Audio Player. The main block is the "Processing Subsystem", which contains a "Processor", "Memory", and "Audio Codec". The "Power Subsystem" contains a "Battery", "Charging Unit", and "Battery Monitoring System". The "User Interface" contains a "Touch-screen" and "Buttons". The "Transport Subsystem" is also shown. The diagram illustrates how these subsystems are interconnected and how they share resources like memory and data.</p>	

Topic	Detail	See also
	<p>In this example, the <i>Portable Audio Player's</i> composition is described, detailing how each of the sub-systems is structured</p> <p>It also describes the binding relationships between the parts, which describe how they are functionally bound to one another; for example, the CPU, Memory and Codec are interfaced together in the Processing Subsystem</p>	

12.6 Create Reusable Subsystems

Topics:

Topic	Detail	See also
<p>SysML Design Model</p>	<p>Model Based Systems Engineering provides the flexibility and expressiveness to define complex systems quickly and effectively, by reusing common entities across design projects</p> <p>A <i>Library</i> is a package containing many reusable subsystems, parametric constraints, common data types and common value types, dimensions and units</p> <p>The following diagram shows an example library model:</p>  <p>In the example Library, each of the child packages contains child models that capture the following reusable entities:</p> <ul style="list-style-type: none"> • <i>Blocks</i> defining systems such as those listed in the <i>Components</i> package, or those defined in the <i>External</i> package • <i>ConstraintBlocks</i> defining parametric constraints for use in parametric models. • <i>Value Types</i> describing quantities, expressed as measurable dimensions in specific units • <i>Data Types</i> and <i>Flow Specifications</i> describing data structures and <i>Flows</i> 	

12.7 Migrate SysML 1.1 Model to SysML 1.2

Enterprise Architect enables you to migrate a SysML 1.1 model (or part of a model) to SysML 1.2, using the Automation Interface function *Migrate()*. This function updates the Tagged Values and, if required, stereotypes to SysML1.2 for all elements, attributes, connectors and diagrams under the selected package or element.

Example:

The following VB script calls the *Migrate()* function to migrate the package or element to SysML 1.2:

```
Sub MigrateElement (sGUID, lngPackageID)
    Dim proj as EA.Project
    set proj = Repository.GetProjectInterface
    proj.Migrate sGUID, "SysML1.1", "SysML1.2"

    'refresh the model
    If lngPackageID <> 0 Then
        Repository.RefreshModelView (lngPackageID)
    End If
End Sub

Sub MigrateSelectedItem
    Dim selType
    Dim selElement as EA.Element
    Dim selPackage as EA.Package
    selType = GetTreeSelectedItemType
    If selType = 4 Then 'means Element
        set selElement = GetTreeSelectedObject
        MigrateElement selElement.ElementGUID, selElement.PackageID
        MsgBox "Element Migration Completed", 0, "SysML Migration"
    ElseIf selType = 5 Then 'means Package
        set selPackage = GetTreeSelectedObject
        MigrateElement selPackage.PackageGUID, selPackage.PackageID
        MsgBox "Package Migration Completed", 0, "SysML Migration"
    Else
        MsgBox "Select a Package or Element in the Project Browser to
        initiate migration", 0, "SysML Migration"
    End If
End Sub

Sub Main
    MigrateSelectedItem
End Sub

Main
```

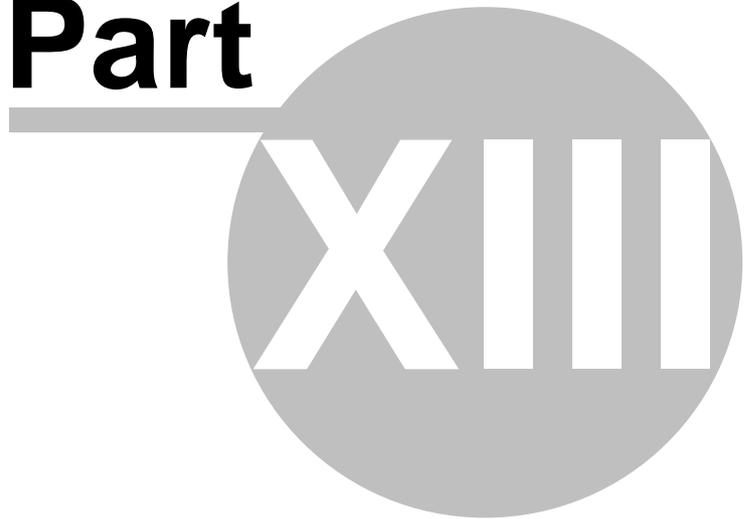

Notes:

- The stereotype *dimension* is changed to *quantitykind* when migrating from SysML1.1 to SysML1.2
- The stereotype *dataType* is removed from SysML1.2
- The Tagged Value *dimension* is migrated to *quantitykind*; this applies to stereotypes *unit* and *valueType*
- The Tagged Value *isConjugated* of stereotype *flowport* is migrated to custom properties

Learn More:

- [Migrate\(\)](#)^[1942]

Part

13 SOA and XML

This section explains how to import and generate:

- XSD
- WSDL

It also describes how to generate and export *Meta-Object* Facility (**MOF**) models, along with describing **SoaML** and **SOME**.

Learn More:

- [XML Schema](#)^[1581]
- [Web Services - WSDL](#)^[1611]
- [SoaML](#)^[1624]
- [SOME](#)^[1628]
- [Generating MOF](#)^[1630]

13.1 XML Schema - XSD

XML Schema Definition (XSD), also known as **XML Schema**, is a **W3C** XML technology that is used to specify the rules to which an XML document must adhere.

Enterprise Architect enables rapid modeling, forward engineering and reverse engineering of XML Schema. XSD support is critical for the development of a complete *Service Oriented Architecture* (SOA), and the coupling of UML 2.3 and XML provides the natural mechanism for specifying, constructing and deploying XML-based SOA artifacts within an organization.

Learn More:

- [W3C XML Schema](#) (Online Resource)
- [Model XSD using Toolbox](#)^[1581]
- [Abstract XSD Models](#)^[1595]
- [Generate XSD](#)^[1598]
- [Import XSD](#)^[1600]
- [UML Profile for XSD](#)^[1602]

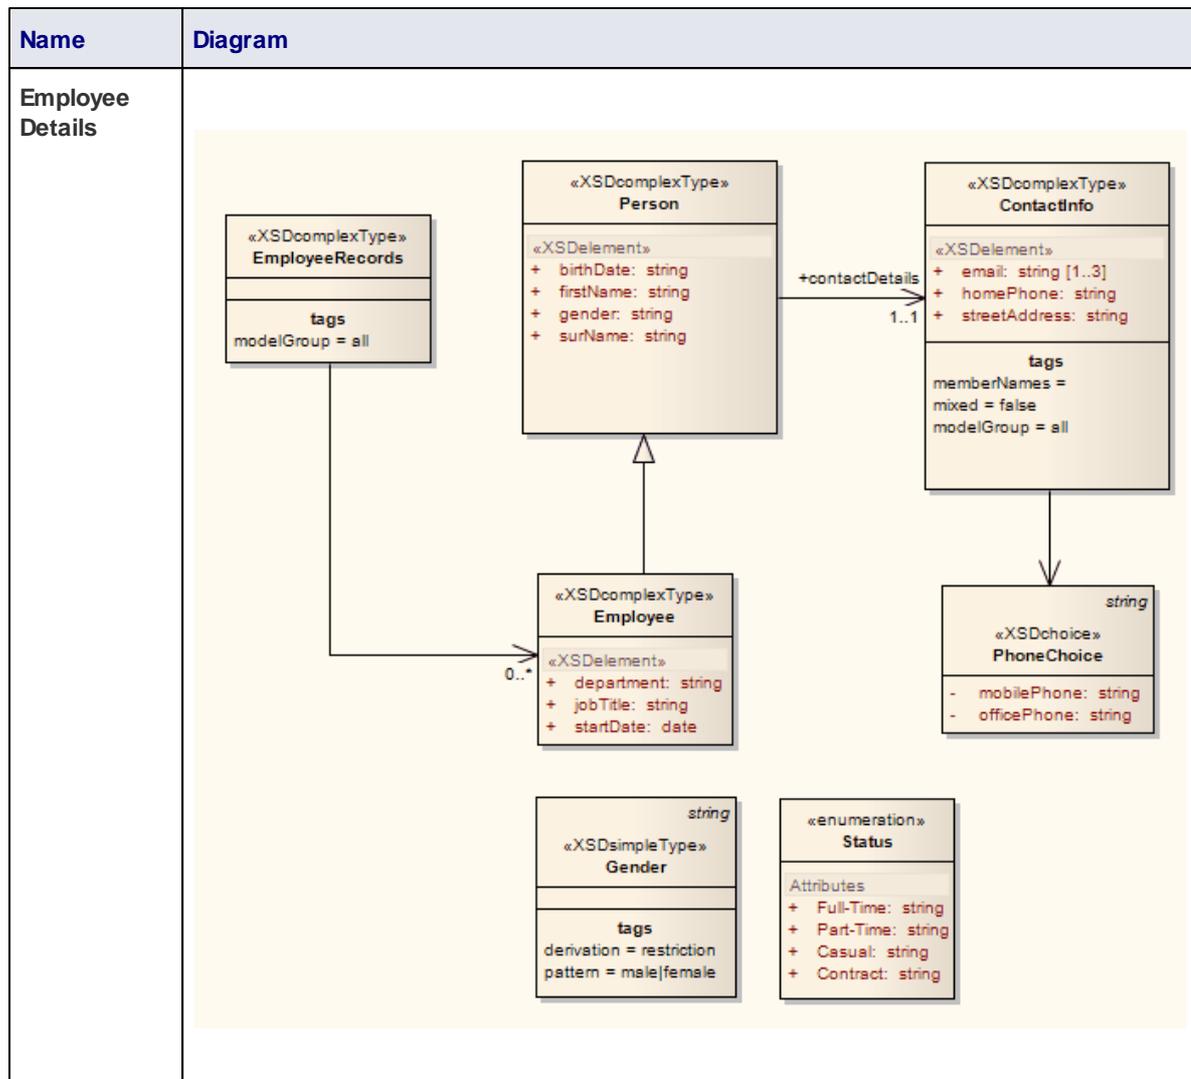

13.1.1 Model XSD

XML schemas are modeled using UML **Class** diagrams. The **XML Schema** page of the **Toolbox** provides built-in support for the **UML profile for XSD**. This enables an abstract UML Class model to be automatically generated as a **W3C XML Schema** (XSD) file.

Access: [View | Toolbox > More tools | XML Schema](#)

How To:

Step	Action	See Also
1	Create a package in the Project Browser	
2	Click on the New Diagram icon in the Project Browser	Project Browser Toolbar ^[452]
3	Select UML Structural in the Select From field and Class in the Diagram Types field	
4	Click on the More tools option in the Toolbox and select XML Schema from the list of Toolboxes	Diagram Toolbox ^[546]
5	Click on the Schema icon from the Toolbox and drag it into the created Class diagram When the New Diagram dialog is displayed, Select UML Structural in the Select From field and Class in the Diagram Types field to create a Class diagram.	Schema Icon ^[1583]
6	Enterprise Architect creates a new <i>XSDschema</i> stereotyped package with a Class diagram under it. Open this Class diagram and use the constructs from the XML Schema Toolbox to model the XML Schema Alternative: XML Schemas can also be modeled using the UML Profile for XSD .	XML Schema Group ^[566] UML profile for XSD ^[1602]

Example:**Notes:**

- The UML attributes of the Classes map directly to XML elements or attributes
- Classes have no methods since there is no meaningful correspondence between Class methods and XSD constructs

Modeling Restrictions:

The following XML Schema constructs cannot be modeled in Enterprise Architect:

- *appinfo*
- *field*
- *key*
- *keyref*
- *notation*
- *redefine*
- *selector*
- *substitutionGroup*

- *unique*

13.1.1.1 Schema Package

The **Schema** icon in the **XML Schema** Toolbox creates an *XSDschema* stereotyped package that acts as a container for the XSD constructs, from which XML Schema can be generated.

XSD Properties:

Double-click on the *XSDschema* stereotyped package in the diagram or the **Project Browser**

Reference:

Field/Button	Usage	See Also

--	---	---

13.1.1.2 Global Element

The **Element** icon from the **XML Schema** Toolbox creates an *XSDtopLevelElement* stereotyped Class, which acts as a XSD global element, when dropped directly on a diagram.

XSD Properties:

Double-click on the *XSDtopLevelElement* stereotyped Class in the diagram or the **Project Browser**

Reference:

Field/Button	Usage	See Also						
Name	Specify the name for this global element							
Type	Specify either an XSD <i>built-in dataType</i> or <i>complexType</i> or <i>simpleType</i>							
Value	If Type is an XSD <i>built-in type</i> then optionally specify its value <table border="1" data-bbox="507 994 1262 1173"> <thead> <tr> <th>Option</th> <th>Usage</th> </tr> </thead> <tbody> <tr> <td>Default</td> <td>Specifies Value as default value</td> </tr> <tr> <td>Fixed</td> <td>Specifies Value as fixed</td> </tr> </tbody> </table>	Option	Usage	Default	Specifies Value as default value	Fixed	Specifies Value as fixed	
Option	Usage							
Default	Specifies Value as default value							
Fixed	Specifies Value as fixed							
Nested complexType	Check this option to create an <i>XSDcomplexType</i> as a child of this global element	Complex Type 						
Nested simpleType	Check this option to create an <i>XSDsimpleType</i> as a child of this global element	Simple Type 						
Annotation	Specify the notes for this element (<i>Optional</i>)							
OK	Save the values entered and close the dialog							
Cancel	Discard the values entered and close the dialog							
Help	Display this Help topic							
UML	Open the UML Properties dialog This button is available when editing the global element	Properties 						

Notes:

- The fields **Nested complexType** and **Nested simpleType** are available in the dialog only when creating a new global element (and not when editing the global element)
- The fields **Type**, **Nested complexType** and **Nested simpleType** are mutually exclusive - selecting one disables the others
- Global elements cannot contain any UML Attributes
- Global elements cannot be the source of Association connector
- Global elements cannot be the target of a Generalization connector
- Global elements can be the target of Association connector from Complex Type or Group Class

- Global elements can have at most one Generalization connector to a Complex Type or Simple Type Class

13.1.1.3 Local Element

The **Element** icon from the **XML Schema** Toolbox creates an *XSDelement* stereotyped UML Attribute, which acts as a local XSD element, when dropped on a *XSDcomplexType* and *XSDgroup* stereotyped classes.

XSD Properties:

Double-click on the *XSDelement* stereotyped UML Attribute in the diagram or the **Project Browser**

Reference:

13.1.2 Abstract XSD models

XML schemas can also be modeled using simple, abstract Class models. This can be useful in enabling an architect to start working at a higher level of abstraction, without concern for the implementation details of a Schema. Such an abstract model can be refined further using the **XML Schema** pages of the **Toolbox**, or it can be generated directly by Enterprise Architect's **Schema Generator**. In this case, a set of **default mappings** is assumed by the schema generator to convert the abstract model to an XSD file.

Example:

Topic	Detail
Diagram	<p>The following is a simplified version of the <i>Employee Details</i> example model, which does not use XSD-specific stereotypes or Tagged Values:</p>  <pre> classDiagram class EmployeeRecords class Person { - birthDate: string - firstName: string - gender: string - surName: string } class Employee { - department: string - jobTitle: string - startDate: Date - status: Status } class ContactInfo { - email: string - homePhone: string - mobilePhone: string - officePhone: string - streetAddress: string } class Status { <<enumeration>> Full-Time Part-Time Casual Contract } EmployeeRecords --> Employee : 0..* Employee < -- Person Person --> ContactInfo : +contactDetails, 1 </pre>
Schema	<p>The following schema fragment would be generated by Enterprise Architect, given the above model:</p> <pre> <?xml version="1.0"?> <xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"> <xs:simpleType name="Status"> <xs:restriction base="xs:string"> <xs:enumeration value="Full-Time"/> <xs:enumeration value="Part-Time"/> <xs:enumeration value="Casual"/> <xs:enumeration value="Contract"/> </xs:restriction> </xs:simpleType> <xs:element name="Person" type="Person"/> <xs:complexType name="Person"> <xs:sequence> <xs:element name="firstName" type="xs:string"/> <xs:element name="surName" type="xs:string"/> <xs:element name="birthDate" type="xs:string"/> <xs:element name="gender" type="xs:string"/> <xs:element name="contactDetails" type="ContactInfo"/> </xs:sequence> </xs:complexType> <xs:element name="Employee" type="Employee"/> <xs:complexType name="Employee"> <xs:complexContent> <xs:extension base="Person"> <xs:sequence> <xs:element name="status" type="Status"/> <xs:element name="jobTitle" </pre>

Topic	Detail
	<pre> type="xs:string" /> type="xs:date" /> type="xs:string" /> </xs:sequence> </xs:extension> </xs:complexContent> </xs:complexType> <xs:element name="EmployeeRecords" type="EmployeeRecords" /> <xs:complexType name="EmployeeRecords"> <xs:sequence> <xs:element name="Employee" type="Employee" minOccurs="0" maxOccurs="unbounded" /> </xs:sequence> </xs:complexType> <xs:element name="ContactInfo" type="ContactInfo" /> <xs:complexType name="ContactInfo"> <xs:sequence> <xs:element name="homePhone" type="xs:string" /> <xs:element name="mobilePhone" type="xs:string" /> > <xs:element name="officePhone" type="xs:string" /> > <xs:element name="email" type="xs:string" /> <xs:element name="streetAddress" type="xs: string" /> </xs:sequence> </xs:complexType> </xs:schema> </pre>

- [Default UML to XML Mappings](#) ^[1597]
- [Generate XSD](#) ^[1598]

13.1.2.1 Default UML to XSD Mappings

The following table describes the default mapping of UML to XSD constructs. This set of mappings is useful when defining simple schemas from abstract Class models. The defaults are also assumed by the schema generator when generating unsteretyped elements in an abstract model. The **XML Schema** pages of the **Toolbox** (and UML Profile for XSD) override these default mappings through the use of stereotypes and Tagged Values.

UML Construct	Default XSD Production Rules
Package	<p>A schema element is generated for the target package. If the target package includes Classes from another package, which has the Tagged Values <i>targetNamespace</i> and <i>targetNamespacePrefix</i> set, these are included as attributes of the schema element.</p> <p>In addition, an <i>import</i> or <i>include</i> element is created for each referenced package. (An <i>include</i> element is used if the external package shares the same <i>targetNamespace</i> Tagged Value as the target package. An <i>import</i> element is used where the <i>targetNamespaces</i> differ).</p>
Class	<p>A root-level element declaration and <i>complexType</i> definition are generated. The element name and type are the same as the Class name. An XSD sequence model group is generated to contain UML attributes generated as elements.</p>
Attribute	<p>An element is declared for each Class attribute. The element name is set to that of the UML attribute name. This is prefixed with the Class name to make the element</p>

UML Construct	Default XSD Production Rules
	unique. The <i>minOccurs</i> and <i>maxOccurs</i> attributes are set to reflect the attribute cardinality. If the attribute refers to another Class, the element declaration is followed a <i>complexType</i> definition, which contains a reference to the appropriate <i>complexType</i> .
Association	An element is declared for each association owned by a Class. The element name is set to that of the association role. The <i>minOccurs</i> and <i>maxOccurs</i> reflect the cardinality of the association.
Generalization (Inheritance)	For single inheritances, an extension element is generated with the base attribute set to the base Classname. The UML attributes of the child Class are then appended to an all model group within the extension element.
«enumeration» (stereotype)	A <i>simpleType</i> element is declared for the enumeration Class with the name attribute set to the Classname. A restriction element is generated with base set to string. Each of the Class attributes is appended to the restriction element as XSD enumeration elements with value set to the UML attribute name. Any type specification for the UML attributes is ignored by the schema generator.

Notes:

- If left unspecified, *minOccurs* and *maxOccurs* default to 1
- If the direction of the association is unspecified, the owner is assumed to be the source

13.1.3 Generate XSD

The **Generate XML Schema** feature forward-engineers a UML Class model to a W3C XML Schema (XSD) file. An XML schema corresponds to a UML package in Enterprise Architect, therefore XML schema generation is a package-level operation.

Access:

- **Tools | XML Schema | Generate XML Schema**
- Right-click on a package in the **Project Browser** and select the following context menu : **Code Engineering | Generate XML Schema**

13.1.3.1 Generate Global Element

Enterprise Architect, by default, generates XML Schema in the **Garden of Eden** style. For every global *XSDcomplexType* stereotyped Class, Enterprise Architect generates a global element.

Example:

You can change the above specified default behaviour by de-selecting the **Generate global element for all global ComplexTypes** checkbox on the **Generate XML Schema** dialog. Then, the generated XSD no longer contains the global element.

Learn More:

- [Generate XML Schema](#)¹⁵⁹⁸

13.1.4 Import XSD

The **XML Schema Import** facility is used to reverse engineer a W3C XML Schema (XSD) file as a UML Class model. An XSD file is imported into Enterprise Architect as a UML package.

Access:

- **Tools | XML Schema | Import XML Schema**
- Right-click on a package in the **Project Browser** and select the following context menu : **Code Engineering | Import XML Schema**

Reference:

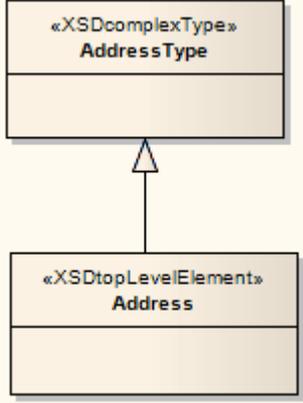

Field/Option/Button	Usage	See also										
Root Package	Indicates the name of the package selected.											
Directory	Specifies the directory where the XSD file(s) is located.											
Selected File(s)	Lists the XML Schema(s) currently selected for import. To select several individual files CTRL + left click on each file. To select a range of files, press SHIFT and select the first and last file in the range.											
Import Options	<table border="1"> <thead> <tr> <th>Field</th> <th>Usage</th> </tr> </thead> <tbody> <tr> <td>Import global elements with "Type" postfix</td> <td>Treat the global elements as <i>ComplexType</i> if it is referenced as separate entities.</td> </tr> <tr> <td>Import referenced XML Schema(s)</td> <td>Import any XML Schema referenced by any of the Selected File(s) field.</td> </tr> <tr> <td>Create Diagram for XML Schema(s)</td> <td>Creates a Class diagram for the imported <i>XSDschema</i>.</td> </tr> <tr> <td>Import XSD Elements/Attributes as</td> <td>Indicate how the inline <i>XSDattributes</i> are imported.</td> </tr> </tbody> </table>	Field	Usage	Import global elements with "Type" postfix	Treat the global elements as <i>ComplexType</i> if it is referenced as separate entities.	Import referenced XML Schema(s)	Import any XML Schema referenced by any of the Selected File(s) field.	Create Diagram for XML Schema(s)	Creates a Class diagram for the imported <i>XSDschema</i> .	Import XSD Elements/Attributes as	Indicate how the inline <i>XSDattributes</i> are imported.	Global Element and ComplexType
Field	Usage											
Import global elements with "Type" postfix	Treat the global elements as <i>ComplexType</i> if it is referenced as separate entities.											
Import referenced XML Schema(s)	Import any XML Schema referenced by any of the Selected File(s) field.											
Create Diagram for XML Schema(s)	Creates a Class diagram for the imported <i>XSDschema</i> .											
Import XSD Elements/Attributes as	Indicate how the inline <i>XSDattributes</i> are imported.											
Import	Initiate XSD Import.											
Close	Close this dialog.											
Help	Display this Help topic											
Progress	Lists the progress of Schema Import.											

Notes:

- If an XML Schema file being imported already exists in the model, Enterprise Architect skips importing the file
- References to XSD *Primitive Types* are always imported as UML Attributes
- References to XSD constructs in external Schema files are always imported as UML Attributes
- Enterprise Architect uses the *schemaLocation* attribute in the *XSD Import* and *XSD Include* elements of an XML Schema to determine the dependencies between the files. Ensure that this attribute is set to a valid file path (and not a URL) for the dependent XML Schema(s) to be imported correctly

13.1.4.1 Global Element and ComplexType

Topic	Detail
ComplexType element naming convention	Some XML Schemas have ComplexType elements with the same name as the referring global elements, but with the suffix <i>Type</i> as shown below: <pre><xs:element name="Address" type="AddressType" /> <xs:complexType name="AddressType" /></pre>

Topic	Detail
	<pre data-bbox="531 309 866 365"><xs: sequence / > </ xs: compl exType ></pre> <p data-bbox="483 369 1409 454">On XSD import, Enterprise Architect treats this global element and its bounding ComplexType as a single entity and creates a single XSDcomplexType stereotyped Class with the same name as the global element as shown below:</p> 
<p data-bbox="260 689 451 745">Changing the default behavior</p>	<p data-bbox="483 689 1409 902">You can change the above specified default behaviour by selecting the Import global elements with "Type" postfix checkbox. When you select this option, Enterprise Architect treats the global element and the ComplexType it is referring to as two separate entities. So, for the above example, Enterprise Architect creates an <i>XSDtopLevelElement</i> stereotyped Class for the global element and an <i>XSDcomplexType</i> stereotyped Class for the ComplexType, and connects them as follows:</p> 

Notes:

- Enterprise Architect treats the following as two separate entities irrespective of whether the **Import global elements with "Type" postfix** checkbox is selected or unselected:

```
<xs: element name=" HomeAddress" type=" AddressType" / >
<xs: complexType name=" AddressType" >
  <xs: sequence / >
</ xs: compl exType >
```

- [Import XML Schema](#)^[1600]

13.1.5 UML Profile for XSD

The **UML Profile for XSD** specifies a set of stereotypes, tagged values and constraints that can be applied to the UML model in order to change particular aspects of the resulting schema. For example, you might have to convert certain UML Class attributes to XSD attributes, or use a model group other than the default *Sequence*.

Enterprise Architect provides native support for the UML Profile for XSD via the **XML schema** page of the Diagram Toolbox. Alternatively, you can use the profile via Enterprise Architect's generic profile mechanism by downloading the UML Profile for XSD. The XSD profile used by Enterprise Architect is an adaptation of the profile defined in *Modeling XML Applications with UML* (David Carlson).

Learn More:

- [Profile for XML Schema](#)^[1603]
- [XSD Datatypes Package](#)^[1610]

13.1.5.1 Profile for XML Schema

The **UML Profile for XSD** specifies stereotypes that provide an explicit mapping from XSD to UML constructs. The Tagged Values further define aspects of the mapping, such as whether the elements should be qualified. The constraints define any conditions that must be satisfied for the stereotype to apply.

The UML Profile for XSD specifies the following stereotypes:

- [XSDschema](#)^[1603]
- [XSDcomplexType](#)^[1604]
- [XSDsimpleType](#)^[1605]
- [XSDsequence](#)^[1605]
- [XSDchoice](#)^[1606]
- [XSDelement](#)^[1606]
- [XSDattribute](#)^[1607]
- [XSDany](#)^[1607]
- [XSDrestriction](#)^[1608]
- [XSDgroup](#)^[1608]
- [XSDtopLevelElement](#)^[1608]
- [XSDtopLevelAttribute](#)^[1609]
- [XSDunion](#)^[1609]
- [XSDattributeGroup](#)^[1609]

The following tables list the features of the UML Profile for XSD.

- Tagged Value names are shown in bold followed by the allowed values.
- If a default value is used by Enterprise Architect's schema generator, it is underlined.

«XSDschema»:

UML Construct		Package
Description		All Classes in a package are defined within one schema. This stereotype can be used to specify schema-wide settings.
Toolbox Icon		 Schema
Tagged Values	anonymousRole (true <u>false</u>)	Specifies if the role name is included in the element declaration for the UML attribute.
	anonymousType (true <u>false</u>)	Specifies whether the Class type is anonymous for attributes.

	attributeFormDefault (qualified <u>unqualified</u>)	Determines whether attribute instances must be qualified.
	defaultNamespace	The default namespace used in this schema. This value is used to specify the default namespace attribute (<i>xmlns=</i>), in the schema element.
	elementDerivation (true false)	Determines whether inheritances are generated using XSD extension or copy-down inheritance.
	elementFormDefault (qualified <u>unqualified</u>)	Determines whether element instances must be qualified.
	memberNames (qualified unqualified)	Determines whether elements generated from Class attributes have their name qualified by the corresponding Class name.
	modelGroup (all <u>sequence</u> choice)	Specifies the default XSD model group used to generate <i>complexType</i> definitions.
	schemaLocation	The URI that identifies the location of the schema. This value is used in the import and include elements.
	targetNamespace	The URI that uniquely identifies this schema's namespace.
	targetNamespacePrefix	The prefix that abbreviates the <i>targetNamespace</i> .
	version	The version of this schema.
	xmlns	The comma separated list of all the namespaces (and their prefixes).
Constraints		None.

«XSDcomplexType»:

UML Construct		Class
Description		<i>complexType</i> definitions are created for generic UML Classes. This stereotypes helps tailor the generation of a <i>complexType</i> definition.
Toolbox Icon		 Complex Type
Tagged Values	memberNames (qualified unqualified)	Determines whether elements generated from the UML Class attributes and associations have their name qualified by the corresponding Class name for this <i>complexType</i> definition.
	mixed (true <u>false</u>)	Determines whether this element can contain mixed element and character content. See the W3CXML Schema recommendation.
	modelGroup (all sequence choice)	Overrides the default XSD model for generating this <i>complexType</i> definition.
	minOccurs	Specifies the minimum number of times the model group in the element can occur.
	maxOccurs	Specifies the maximum number of times the model group in the element can occur.

	nillable (true false)	Specifies whether a null value can be assigned to the top-level element generated for this <i>complexType</i> element.
Constraints		None.

«XSDsimpleType»

UML Construct		Class
Description		An XSD <i>simpleType</i> is generated for Classes with this stereotype.
Toolbox Icon		 Simple Type
Tagged Values	derivation: (restriction list)	Specifies the derivation of the <i>simpleType</i> . See the W3C XML Schema recommendation.
	length:	See the W3C XML Schema recommendation.
	minLength:	
	maxLength:	
	minInclusive:	
	minExclusive:	
	maxInclusive:	
	maxExclusive:	
	totalDigits:	
	fractionDigits:	
	whiteSpace:	
	pattern:	
Constraints		This Class can only participate in an inheritance relation with another <i>simpleType</i> . It cannot have any attributes or own any associations; they are ignored if present.

«XSDsequence»

UML Construct		Class
Description		The schema generator creates a sequence model group as the container for the attributes and associations owned by this Class. The model group is in turn added to the model groups of this Class respective owners. Tagged values specified by owners of this Class persist through to the child elements of this model group. Thus if

		<i>memberNames</i> are unqualified for a <i>complexType</i> , so are the children of this model group when added to that <i>complexType</i> .
Toolbox Icon		
Tagged Values		None.
Constraints		This Class must be the destination of unidirectional associations. If it is not, this Class and its connectors are ignored, possibly invalidating other model group Classes. Inheritance relations are ignored for this Class.

«XSDchoice»

UML Construct		Class
Description		Creates an XSD choice element. See <i>XSDsequence</i> for more details.
Toolbox Icon		
Tagged Values		None.
Constraints		As for <i>XSDsequence</i> .

«XSDElement»

UML Construct		UML Attribute, Association <i>End</i>
Description		By applying this stereotype to a UML Class or Association <i>End</i> , the corresponding UML entity is generated as an element within the parent <i>complexType</i> and not as an XSD attribute.
Toolbox Icon		
Tagged Values	form: (qualified unqualified)	Overrides the schema's <i>elementFormDefault</i> value.
	position:	Causes the elements to be ordered within a sequence model group of the containing <i>complexType</i> . Duplicated and invalid position Tagged Values are ignored and result in undefined ordering of the UML attributes. Missing position values cause the defined positions to be allocated as specified, with the remaining elements filling the missing positions in an undefined order.
	anonymousRole: (true false)	Specifies if the role name is included in the element declaration for the UML attribute.
	anonymousType: (true false)	Specifies whether the Class type is anonymous for attributes.

	nillable (true false)	Specifies whether a null value can be assigned to this element.
	default	See the W3C XML Schema recommendation.
	fixed	
Constraints		None.

«XSDattribute»

UML Construct		UML Attribute, Association <i>End</i>
Description		By applying this stereotype to a UML Class attribute or Association <i>End</i> , the corresponding UML entity is generated as an XSD attribute within the parent <i>complexType</i> and not as an XSD element.
Toolbox Icon		 Attribute
Tagged Values	form: (qualified unqualified)	Overrides the schema's <i>attributeFormDefault</i> value.
	use: (prohibited optional required)	See the W3C XML Schema recommendation.
	default	
	fixed	
Constraints		The attribute <i>datatype</i> should not see a Class specification, otherwise it is ignored.

«XSDany»

UML Construct		UML Attribute
Description		If applied to a UML attribute, an XSD <i>anyAttribute</i> element is generated. If applied to a UML Class, an XSD <i>any</i> element is generated.
Toolbox Icon		 Any Attribute
Tagged Values	namespace:	See the W3C XML Schema recommendation.
	processContents: (skip lax strict)	
Constraints		None.

«XSDrestriction»

UML Construct		Generalization
Description		Overrides the default use of XSD extension for inheritance and generates the child as a <i>complexType</i> with a restriction element instead.
Tagged Values		None.
Constraints		Applies only to UML Class parent-child relations.

«XSDgroup»

UML Construct		Class
Description		An <i>XSDgroup</i> is generated for Classes with this stereotype.
Toolbox Icon		
Tagged Values	modelGroup: (<u>sequence</u> choice all)	Overrides the default XSD model for generating this group definition.
Constraints		A group Class can only associate itself to other group Classes. A group Class can be associated by another group Class or a <i>complexType</i> Class. The association should be via an Association connector. A group Class cannot be inherited/aggregated.

«XSDtopLevelElement»

UML Construct		Class
Description		Creates an <code><xs:element></code> construct which acts as a container for <i>XSDcomplexType</i> and <i>XSDsimpleType</i> Class.
Toolbox Icon		
Tagged Values	default	See the W3C XML Schema recommendation.
	fixed	
Constraints		An <i>XSDtopLevelElement</i> Class can contain either an <i>XSDsimpleType</i> or an <i>XSDcomplexType</i> as its child Class. When such a Class is present as its child, all its inheritance is ignored. This Class cannot be inherited.

«XSDtopLevelAttribute»

UML Construct		Class
Description		Creates an <code><xs:attribute></code> construct which acts as a container for <i>XSDsimpleType</i> Class.
Toolbox Icon		 Attribute
Tagged Values	use: (<i>optional</i> required prohibited)	See the W3C XML Schema recommendation.
	default	
	fixed	
Constraints		An <i>XSDtopLevelAttribute</i> Class can contain only an <i>XSDsimpleType</i> Class as its child Class. When such a Class is present as its child, all its inheritance is ignored. This Class can inherit from only one <i>XSDsimpleType</i> Class.

«XSDunion»

UML Construct		Class
Description		Creates an <code><xs:union></code> construct which can act as a container for <i>XSDsimpleType</i> Class.
Toolbox Icon		 Union
Tagged Values		None
Constraints		An <i>XSDunion</i> Class can contain only <i>XSDsimpleType</i> as its child Class and can generalize from other <i>XSDsimpleType</i> Classes only. All the Classes that this Class generalizes become the members of the attribute <i>memberTypes</i> . This Class cannot have any attributes or associations.

«XSDattributeGroup»

UML Construct		Class
Description		Creates an <code><XSDattributeGroup></code> construct which can act as a container for a set of elements for stereotype <i>XSDattribute</i> .
Toolbox Icon		 Attribute Group

Tagged Values		None
Constraints		<p>An <i>XSDattributeGroup</i> Class can contain only elements of stereotype <i>XSDattribute</i> and can be associated only with other <i>XSDattributeGroup</i> Classes.</p> <p>Only <i>XSDcomplexType</i> Classes can associate with this Class.</p> <p>This Class cannot be inherited.</p>

13.1.5.2 XSD Datatypes Package

When modeling XSD constructs, it is often useful to have the XSD primitive types represented as UML elements. In this way user-defined types, for example, can reference the datatype elements as part of inheritance or association relationships.

Sparx Systems provides the set of primitive XSD data types as a UML package in the form of an XMI file. Each of the XSD primitive types is represented by a UML Class in a package named *XSDDatatypes*.

How To:

Step	Action	See Also
1.	Download the <i>XSDDatatypes</i> package using the link to the right. The file <i>XSDDatatypes.xml</i> is an XMI file.	XSDDatatypes Package (XML file)
2.	Use Enterprise Architect's XMI import facility, which is available via the Project Model Import/Export Import Package from XMI menu option.	XMI import ^[323]
3.	When the XMI import is complete, you have the UML package named <i>XSDDatatypes</i> in your model, from which you can drag and drop the relevant types as required.	

Notes:

- Import and use the XSD Datatypes into Enterprise Architect only if you are modeling the XSD model using the UML Profile for XSD (instead of using the XML Schema Toolbox)

13.2 Web Services - WSDL

Enterprise Architect enables rapid modeling, forward engineering and reverse engineering of **Web Service Definition Language 1.1** (WSDL), a key W3C XML technology.

WSDL support is critical for the development of a complete *Service Oriented Architecture* (SOA), and the coupling of UML 2.3 and XML provides the natural mechanism for specifying, constructing and deploying XML-based SOA artifacts within an organization. This section explains how to use Enterprise Architect to model WSDL files.

Learn More:

- [W3C WSDL Specification](#) (Online Resource)
- [WSDL Model Structure](#)^[1611]
- [Model WSDL](#)^[1612]
- [WSDL Model Transformation](#)^[1325]
- [Generate WSDL 1.1](#)^[1621]
- [Import WSDL 1.1](#)^[1622]

13.2.1 Create WSDL 1.1 Model Structure

Enterprise Architect provides the **WSDL** page in the **Toolbox** to conveniently model WSDL documents. WSDLs, represented as Components marked with the stereotype *WSDL*, are contained in a *WSDLnamespace* stereotyped Package whose hierarchy represents the target WSDL namespace and its constituent *XSD Types*, *Messages*, *PortTypes*, *Bindings* and *Services*. A sample WSDL Package structure can be created in the **Project Browser**, using the **Namespace** icon from the **WSDL** of the **Toolbox**. You can use this package structure as a template for developing your WSDL.

Access: [View](#) | [Toolbox > More tools](#) | [WSDL](#)

Use to:

- Create a new **WSDL** Package structure that can be used as a starting point for developing your WSDL model.

How To:

Step	Action	See Also
1	Create a package in the Project Browser	
2	Click on the New Diagram icon in the Project Browser	Project Browser Toolbar ^[452]
3	Select UML Structural in the Select From field and Class in the Diagram Types field	
4	Click on the More tools option in the Toolbox and select WSDL from the list of Toolboxes	Diagram Toolbox ^[546]
5	Click on the Namespace icon from the Toolbox and drag it into the created Class diagram	WSDL Group ^[565]
6	Specify the WSDL Package Name and Namespace and press OK button to create the sample WSDL Package structure.	Namespace Icon ^[1612]

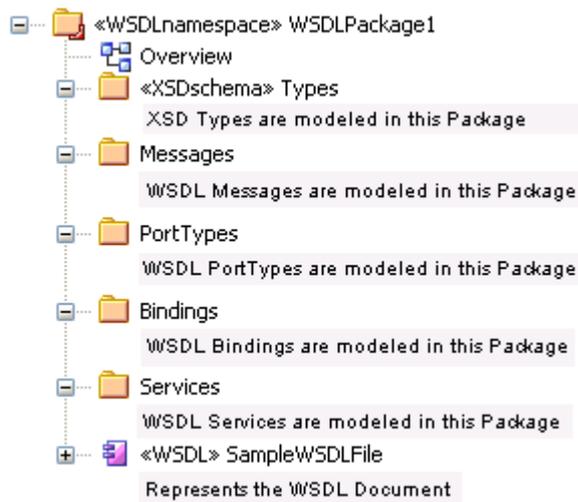

Alternative:

A WSDL Package structure can also be created from an UML Interface using the **WSDL Model Transformation**.

[WSDL Model Transformation](#)^[1325]

Example WSDL Package Structure:

The *WSDLnamespace* Package acts as a container for the WSDL Structure in Enterprise Architect. The various WSDL constructs like *Messages*, *PortTypes*, *Bindings* and *Services* should be modeled in the **Messages**, **PortTypes**, **Bindings** and **Services** Packages respectively.

**Notes:**

- A *WSDLnamespace* package can contain one or more *WSDL* stereotyped Component
- A *WSDL* stereotyped Component can be generated as a WSDL file

Learn More:

- [WSDL Toolbox](#)^[565]
- [Model WSDL](#)^[1612]
- [Generate WSDL 1.1](#)^[1621]
- [Import WSDL 1.1](#)^[1622]

13.2.2 Model WSDL

The **Namespace** icon in the **WSDL** Toolbox creates a *WSDLnamespace* stereotyped Package which represents the top-level container for the WSDL constructs in Enterprise Architect.

WSDL Properties: Double-click on the *WSDLnamespace* stereotyped package in the diagram or the Project Browser

Reference:

Field/Button	Usage	See Also

13.2.2.3 WSDL Binding

The **Binding** icon in the **WSDL** Toolbox creates a *WSDLbinding* stereotyped Class, representing the WSDL Binding. Each *WSDLbinding* Class implements the operations specified by a particular *WSDLportType* Interface and describes the message format and protocol details for the operations and messages defined by this WSDL PortType. WSDL Bindings should be defined under the *Bindings* package in the WSDL Package structure.

WSDL Properties: Double-click on the *WSDLbinding* stereotyped Class in the diagram or the **Project Browser**

Reference:

Field/Button	Usage	See Also
Name	Specify the name for the WSDL PortType	
PortType	Select the WSDL PortType to be implemented by this WSDL Binding.	Port Type ^[1614]
Protocol	Specify the protocol for the transmission of the selected WSDL PortType's Operations. The supported protocols are: <ul style="list-style-type: none"> • SOAP • HTTP 	
Transport	Defines the SOAP protocol. This field is disabled for HTTP protocol. Default: <code>http://schemas.xmlsoap.org/soap/http</code>	
Style	Specify the style of SOAP protocol. This field is disabled for HTTP protocol.	
Verb	Specify the HTTP verb. The supported verbs are: <ul style="list-style-type: none"> • GET • POST This field is disabled for SOAP protocol.	
Documentation	Specify the notes for this element (<i>Optional</i>)

13.2.4 Import WSDL

Enterprise Architect provides a **WSDL Import** facility to reverse engineer WSDL 1.1 files into UML Class models.

Access:

- **Tools | Web Service | Import WSDL**
- Right-click on a Package in the **Project Browser** and select the following context menu : **Code Engineering | Import WSDL**

Reference:

Field/Button	Usage
Filename	Specify the WSDL file to import
Root Package	Specifies the Package under which the WSDL file is to be imported
Target Package	Specifies the name of the Package that represents the imported WSDL file Default: Name of the WSDL file
Import	Initiate the WSDL Import
Close	Close this dialog

Field/Button	Usage
Help	Display this Help topic
Progress	Lists the progress of WSDL Import

Notes:

Enterprise Architect cannot import a WSDL file that references WSDL constructs existing outside this WSDL file	
Importable Example	http://www.w3.org/TR/wsdl.html#_wsdl
Non-importable Example	http://www.w3.org/TR/wsdl.html#_style Attempting to import the second WSDL file would result in the following error: Cannot Import Split Files
Workaround	Combine the split WSDL files into a single file and then import it into Enterprise Architect

13.3 SoaML

Topics:

Topic	Detail	See also
Abstract	<p>The following text is derived from Service oriented architecture Modeling Language (SoaML) - Specification for the UML Profile and metamodel for Services (UPMS) (OMG document ad/2008-11-01); pp. 25-26:</p> <p><i>A service is an offer of value to another through a well-defined interface and available to a community (which may be the general public). A service results in work provided to one by another.</i></p> <p><i>Service Oriented Architecture (SOA) is a way of organizing and understanding (representations of) organizations, communities and systems to maximize agility, scale and interoperability. The SOA approach is simple - people, organizations and systems provide services to each other. These services allow us to get something done without doing it ourselves or even without knowing how to do it - enabling us to be more efficient and agile. Services also enable us to offer our capabilities to others in exchange for some value - thus establishing a community, process or marketplace. The SOA paradigm works equally well for integrating existing capabilities as for creating and integrating new capabilities.</i></p> <p><i>SOA ... is an architectural paradigm for defining how people, organizations and systems provide and use services to achieve results. SoaML ... provides a standard way to architect and model SOA solutions using the Unified Modeling Language (UML). The profile uses the built-in extension mechanisms of UML to define SOA concepts in terms of existing UML concepts.</i></p> <p><i>... the highest leverage of employing SOA comes from understanding a community, process or enterprise as a set of interrelated services and ... supporting that service oriented enterprise with service-enabled systems. SoaML enables business oriented and systems oriented services architectures to mutually and collaboratively support the enterprise mission. ... SoaML depends on Model Driven Architecture® (MDA®) to help map business and systems architectures, the design of the enterprise, to the technologies that support SOA, like web services and CORBA®.</i></p> <p>For further information on the concepts of SoaML, see the specification document on the OMG website SOAML document page.</p>	<p>SOAML document page (Online Resource)</p>
SoaML in Enterprise Architect	<p>Enterprise Architect enables you to model services architectures quickly and simply, through use of an MDG Technology integrated with the Enterprise Architect installer. Topic	Detail	See also
<p>Example SoaML Diagram</p>	<p>The diagram illustrates a SoaML services architecture for a dealer network. At the top level, a dashed oval represents the «servicesArchitecture» named DealerNetworkArchitecture. Inside this architecture, a «collaboration» named ps :PurchasingService is defined. This collaboration has two roles: 'buyer' and 'seller'. The 'buyer' role is associated with a participant «participant» dealer, and the 'seller' role is associated with a participant «participant» mfg. Below these participants, there are detailed boxes for «participant» Dealer and «participant» Manufacturer. The Dealer participant has a «servicePoint» Buyer, and the Manufacturer participant has a «servicePoint» ServicePoint. A «Comment» box provides context: 'The purpose of the dealer network architecture is to establish the financially related services between dealers and manufacturers such that any dealer can do business with any manufacturer.' Dashed arrows labeled 'type' connect the participant boxes to their respective detailed boxes.</p>	
<p>Disable SoaML</p>	<p>If you prefer not to use SoaML in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (Settings MDG Technologies).</p>	<p>Manage MDG Technologies 1033</p>

Notes:

- Service Oriented Architecture Modeling Language (SoaML) is supported in the Corporate, Systems Engineering, Business and Software Engineering and Ultimate editions of Enterprise Architect

13.4 SOMF

Topics:

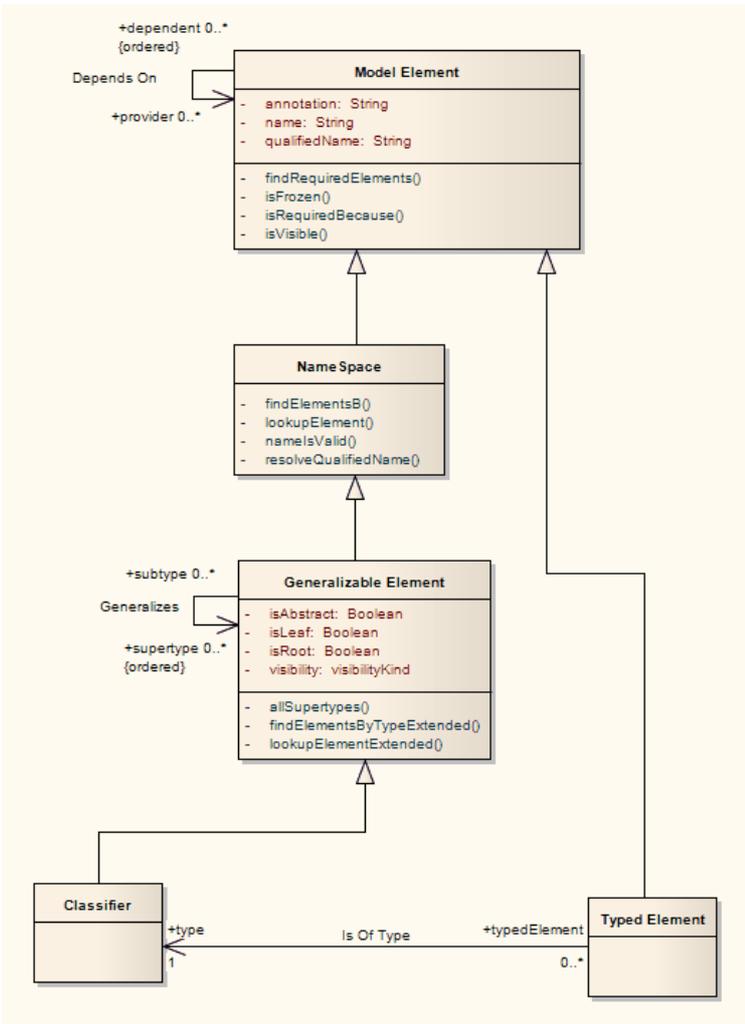

Topic	Detail	See also
Abstract	<p>The following text is derived from the extensive Wikipedia entry on Service Oriented Modeling:</p> <p><i>The Service-Oriented Modeling Framework (SOMF) has been proposed by author Michael Bell as a holistic and anthropomorphic modeling language for software development that employs disciplines and a universal language to provide tactical and strategic solutions to enterprise problems. The term "holistic language" pertains to a modeling language that can be employed to design any application, business and technological environment, either local or distributed. This universality may include design of application-level and enterprise-level solutions, including SOA landscapes or Cloud Computing environments. The term "anthropomorphic", on the other hand, affiliates the SOMF language with intuitiveness of implementation and simplicity of usage.</i></p> <p><i>The service-oriented modeling framework (SOMF) is a service-oriented development life cycle methodology. It offers a number of modeling practices and disciplines that contribute to a successful service-oriented life cycle management and modeling. ... It illustrates the major elements that identify the "what to do" aspects of a service development scheme. These are the modeling pillars that will enable practitioners to craft an effective project plan and to identify the milestones of a service-oriented initiative- either a small or large-scale business or a technological venture.</i></p> <p>For further information on the concepts of SOMF, see the Wikipedia Service Oriented Modeling pages.</p>	<p>Michael Bell (Online Resource)</p> <p>Service Oriented Modeling (Online Resource)</p>
SOMF in Enterprise Architect	<p>In Enterprise Architect, SOMF is implemented as a profile within an MDG Technology that is integrated with the Enterprise Architect installer. 13.5 Generate MOF

Enterprise Architect offers support for exporting packages to XML under the *Meta-Object Facility (MOF)* 1.3 and 1.4 standards. MOF models are created by assigning the stereotype *metamodel* to the package. MOF models can be exported to MOF 1.3 or MOF 1.4 XML file specification.

Topics:

Topic	Detail	See also
<p>Background Knowledge</p>	<p>MOF is an Object Management Group (OMG) standard that originated in the UML, when the OMG required a Meta-Modeling architecture to define the UML. MOF is designed as a four-layered architecture, as illustrated in the following diagram.</p>  <pre> classDiagram class ModelElement { +annotation: String +name: String +qualifiedName: String -findRequiredElements() -isFrozen() -isRequiredBecause() -isVisible() } class Namespace { -findElementsB() -lookupElement() -nameIsValid() -resolveQualifiedName() } class GeneralizableElement { +isAbstract: Boolean +isLeaf: Boolean +isRoot: Boolean +visibility: visibilityKind -allSupertypes() -findElementsByTypeExtended() -lookupElementExtended() } class Classifier class TypedElement ModelElement < -- Namespace ModelElement < -- GeneralizableElement GeneralizableElement < -- Classifier GeneralizableElement < -- TypedElement ModelElement "0..*" -- "0..*" ModelElement : Depends On ModelElement "0..*" -- "0..*" ModelElement : +provider GeneralizableElement "0..*" -- "0..*" GeneralizableElement : +subtype GeneralizableElement "0..*" -- "0..*" GeneralizableElement : +supertype Classifier "1" -- "0..*" TypedElement : +type TypedElement "0..*" -- "1" Classifier : Is Of Type TypedElement "0..*" -- "0..*" ModelElement : +typedElement </pre> <p>Because of the similarities between the MOF-model and UML structure models, MOF meta-models are usually modeled as UML Class diagrams. You can also use the Metamodel page of the Toolbox to create MOF model elements and connectors. A supporting standard of MOF is XML, which defines an XML-based exchange format.</p> <p>MOF is a closed, strict meta-modeling architecture; every model element on every layer is strictly an instance of a model element of the layer above. MOF only provides a means to define the structure</p>	<p>Class Diagrams ⁷⁹⁸</p> <p>Metamodel Group ⁵⁶</p>

Topic	Detail	See also
	<p>or abstract syntax of a languages or of data.</p> <p>Simplified, MOF uses the notion of Classes, as known from object orientation, to define concepts (model elements) on a meta-layer. These Classes (concepts) can then be instantiated through objects (instances) of the model layer below. Because an element on the M2 layer is an object (instance of an M3 model element) as well as a Class (an M2 layer concept) the notion of a <i>clabject</i> is used. <i>Clabject</i> is a merge of the words Class and Object.</p> <p>Another related standard is OCL, which describes a formal language that can be used to define model constraints by means of predicate logic.</p>

13.5.1 Getting Started

MOF diagrams are **Class** diagrams that are contained in packages with a metamodel stereotype.

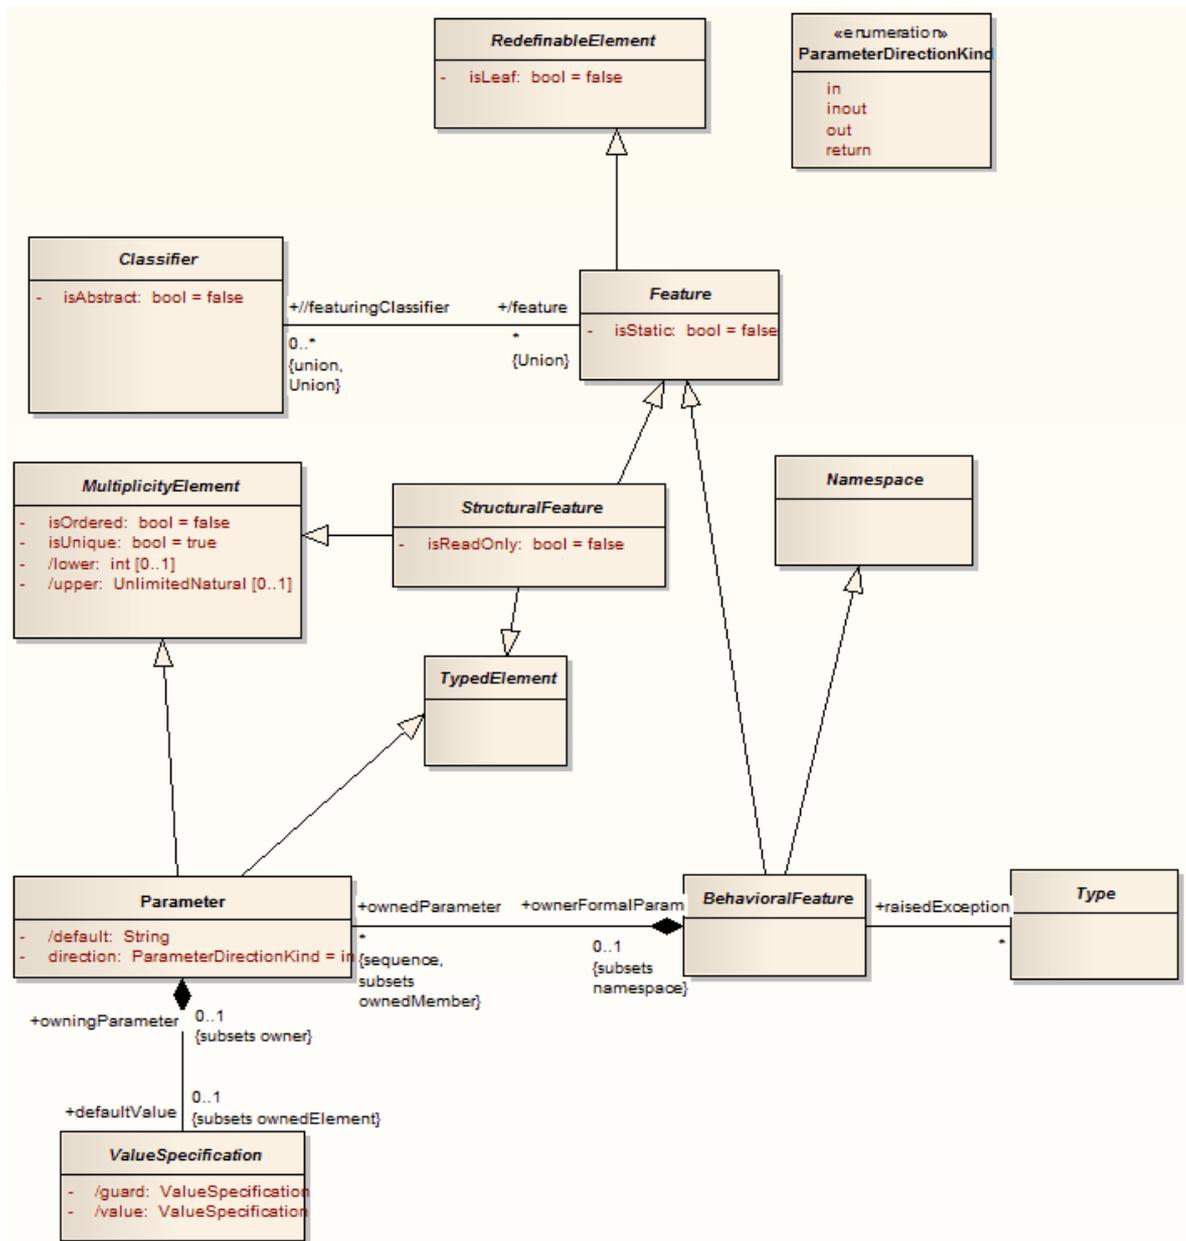

To create a MOF diagram, follow the steps below

How To:

Step	Action	See Also
1.	Create a package to contain your MOF elements.	
2.	Double-click on the package name to display the Properties dialog.	
3.	In the Stereotype field type the value metamodel .	
4.	Click on the OK button.	
5.	Right-click on the package in the Project Browser and select the Add Add Diagram context menu option. Create a Class diagram (the default diagram).	
6.	Give your MOF Class diagram an appropriate name.	
7.	In the Toolbox , select the More tools Metamodel menu option and add the required Metamodel elements to the diagram.	Metamodel Group ¹⁵⁶¹

Example:

The following is an example of a MOF diagram. A MOF diagram can typically contain Package, Class, Enumeration and Primitive elements, and Generalization, Association, Compose and Aggregate relationships.

**Learn More:**

- [Class Diagram](#) ^[798]

13.5.2 Export MOF to XML

To export a MOF diagram to XML, specifying the MOF 1.3 or MOF 1.4 standard, follow the steps below

How To:

Step	Action	See Also
1.	Right-click on the package in the Project Browser . The context menu displays.	

Step	Action	See Also
2.	Select the Import/Export Export Package to XMI file menu option. The Export Package to XMI dialog displays:	
3.	In the Filename field, type a name for the XMI file.	
4.	De-select the Enable full EA Roundtrip checkbox.	
5.	In the XMI Type field, click on the drop-down arrow and select MOF 1.3 or MOF 1.4 .	
6.	Click on the Export button and wait until the Progress bar reads 100% .	
7.	Once your file has been created, you can view it by clicking on the View XMI button.	Metamodel Group [56↑]

Notes:

- MOF diagrams exported to XMI can be imported using the regular import XMI features of Enterprise Architect. See **Import from XMI**

Learn More:

- [Import from XMI](#) [323]

Part

14 Visual Execution Analyzer

This section describes the recording and visual analysis of executing applications in Enterprise Architect.

The Visual Execution Analyzer builds on and processes the structures and operations of the Model Driven Development Environment (MDDE). The MDDE provides tools to design, build and debug an application, forming part of the Debugger facilities of Enterprise Architect.

One of the primary objectives of the Visual Execution Analysis feature is to enable you to work with the stack traces you captured in debugging your application, to generate Sequence diagrams. This is a great way to document and understand what your program is doing during its execution phase.

Access: **Analyzer**
Project Manager package context menu | Execution Analyzer

Use To:

- Optimize existing system resources and understand resource allocation
- Ensure that the system is following the rules as designed
- Produce high quality documentation that more accurately reflects system behavior
- Understand how and why systems work
- Train new employees in the structure and function of a system
- Provide a comprehensive understanding of how existing code works
- Identify costly or unnecessary function calls
- Illustrate interactions, data structures and important relationships within a system
- Trace problems to a specific line of code, system interaction or event
- Visualize why a sequence of events is important
- Establish the sequence of events that occur immediately prior to system failure
- Simulate the execution of behavior models including State Machines, Activities and Interactions

Topics:

Topic	See
Record executing programs and represent the behavior as a UML Sequence diagram; recording is supported for: <ul style="list-style-type: none"> • Microsoft Windows Native C • Microsoft Windows Native C++ • Microsoft Windows Visual Basic • Microsoft .NET Family (C#, J#, VB) • Sun Microsystems Java • PHP 	Recording Sequence Diagrams ^[1637]
Simulate UML behavior models to verify their logical and design correctness, for:	Model Simulation ^[1681]

14.1 Recording Sequence Diagrams

This section explains how to use the Visual Execution Analyzer to record execution data in the form of a Sequence Diagram.

A Sequence diagram provides easy to understand visual information including:

- A representation of how information is passed through a system
- The sequence of various functions and their corresponding parameters
- A clear view of how different Classes interact to create behavior
- A visual overview of how data structures are used to produce results

A Sequence diagram extends traditional analysis to help identify errors in logic, explain unexpected system behavior and identify data flow inconsistencies; the Visual Execution Analyzer extends analysis through the use of a comprehensive array of reports that detail everything from state transitions through to the contents of the stack at a given time.

Access: [Analyzer](#) | [Record](#) | [Recorder](#)

Use To:

- Set up and control the recording of code execution
- Interpret the results of recording
- Generate Sequence diagrams from the recording, and moderate the contents of the diagram

Topics:

Review the following topics in sequence:

14.1.2 Setup for Recording

This section explains how you prepare to record execution of the application.

Topic	Link
Satisfying the prerequisites for recording execution of the application	Prerequisites ^[1639]
Controlling the detail of a recording by adjusting the stack depth and applying filters	Configuring Recording Detail ^[1639]

14.1.2.1 Pre-Requisites

This topic discusses the prerequisites for recording execution of the application

To set up the environment for recording Sequence diagrams you must

- Have completed the Basic setup for Build & Debug
- Be able to successfully debug the application

Learn More:

- [Build and Debug Prerequisites](#)^[1391]
- [Build and Debug Setup](#)^[1392]
- [Debugging](#)^[1416]

14.1.2.2 Configure Recording Detail

To avoid generating an overly complex sequence diagram, you need to control of the scope of what is being recorded.

To narrow the scope of the recording, you can configure two Analyzer properties:

- Filtering - using the Analyzer Script you can exclude specific modules, Classes and functions from the recording
- Stack Depth - this can be used to speed up recording and present a clearer diagram (see Notes below)

Access: **Analyzer | Execution Analyzer (Shift + F12) Double-click on required Analyzer Script > Recording**

Topics:

Topic	Detail	See also
Filtering	<p>If the Enable Filter checkbox is selected on the Recording page of the Execution Analyzer Script Editor, the debugger excludes calls to matching methods from the generated Sequence history and diagram; the comparison is case-sensitive</p> <p>To add a value, click on the New (Insert) icon in the right corner of the Exclusion Filters box, and type in the comparison string; each filter string takes the form:</p> <pre>class_name_token::method_name_token</pre> <p>The <i>class_name_token</i> excludes calls to all methods of a Class or Classes that have a name matching the token; the string can contain the wildcard character * (asterisk)</p> <p>The <i>method_name_token</i> excludes calls to methods having a name that matches the token; again, the string can contain the wildcard character *</p> <p>Both tokens are optional; if no Class token is present, the filter is applied only to global or public functions (that is, methods not belonging to any Class)</p>	Managing Analyzer Scripts ^[1392] Analyzer Script Editor ^[1394]
Example	<p>In the Java example below, the debugger would exclude:</p> <ul style="list-style-type: none"> • Calls to the <i>OnDraw</i> method for the Class <i>Example.common.draw.DrawPane</i> • Calls to any method of any Class having a name beginning with <i>Example.source.Collection</i> • Calls to any constructor for any Class (such as <i><clint></i> and <i><init></i>) <div data-bbox="427 1227 874 1377" style="border: 1px solid gray; padding: 5px;"> <p>Filters</p> <p>Example.common.draw.DrawPane::OnDraw</p> <p>Example.source.Collection*</p> <p>*:init*</p> </div> <p>In the Native Code example below, the debugger would exclude:</p> <ul style="list-style-type: none"> • Calls made to Standard Template Library namespace • Calls to any Class beginning with <i>TOb</i> • Calls to any method of Class <i>CLock</i> • Calls to any Global or Public Function with a name beginning with <i>Get</i> • Calls to the method <i>GetLocation</i> for Class <i>Ctrain</i> <div data-bbox="427 1675 874 1892" style="border: 1px solid gray; padding: 5px;"> <p>Filters</p> <p>std*</p> <p>TOb*</p> <p>CLock</p> <p>CTrain::GetLocation</p> <p>::Get*</p> </div>	

Reference:

To Filter	Use Filter Entry
All public functions having a name beginning with Get from the recording session (for example, <i>GetClientRect</i> in Windows API)	:: Get *
All methods beginning with Get for every Class member method	* :: Get *
All methods beginning with Get from the Class <i>CClass</i>	CClass :: Get *
All methods for Class <i>CClass</i>	CClass :: *
All methods for Classes belonging to Standard Template and Active Template Libraries	ATL* std*
The specific method <i>GetName</i> for Class <i>CClass</i>	CClass :: GetName

Notes:

By default, the Analyzer stack depth is restricted to four frames. This is relative to the depth at which the recording marker is encountered.

You can control stack depth on the toolbar of either

- The Breakpoint and Markers window or
- The Record & Analyze window

Learn More:

- [Control Stack Depth](#)^[1641]
- [Marker Types](#)^[1642]
- [Recorder Toolbar](#)^[1648]

14.1.2.3 Control Stack Depth

When recording particularly high-level points in an application, the stack frame count can result in a lot of information being collected; to achieve a quicker and clearer picture, it is better to limit the stack depth by setting the stack frame threshold.

Topics:

Topic	Detail	See also
Usage	Set the Control Stack depth in the numerical field on the toolbar of Breakpoints and Markers window or the Record & Analyze window	Breakpoint & Markers ^[1646]

Topic	Detail	See also
	 <p>The depth is relative to the stack depth where the Debugger first encountered the recording marker; so, when recording begins, if the stack depth is 6 and the limit depth is set to 3, the Debugger will record to a stack depth of 9</p> <p>For situations where the stack is very large, it is recommended that you first use a low stack frame threshold of 2 or 3 and gradually increase it if necessary to expand the picture.</p>	Control the Recording Session ^[1648]

14.1.3 Place Recording Markers

This section explains how to deploy recording markers:

Access: [Analyzer | Break Points and Markers](#)

Use To:

Trace marking enables you to silently record code execution between two points. This can be used for generating a Sequence diagram. As this records the execution of multiple threads, it can be particularly useful in capturing event driven sequences (such as mouse and timer events).

Topic	Link
Explaining the types and effects of the various kinds of recording markers, which are similar to breakpoints but determine the action the debugger takes when it comes to one	Marker Types ^[1642] Recording Activity for a Class ^[1646] Recording Activity for a Single Method ^[1645]
How to manage breakpoints in the Breakpoint & Markers window	The Breakpoint & Markers Window ^[1646]
How to activate and deactivate markers	Activate and Disable Markers ^[1647]
Working with Marker Sets	Working with Marker Sets ^[1648]

14.1.3.1 Marker Types

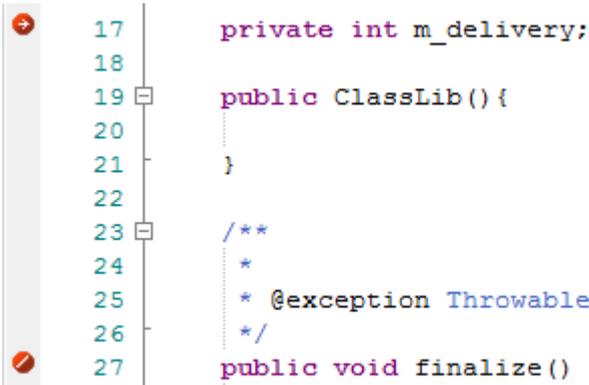

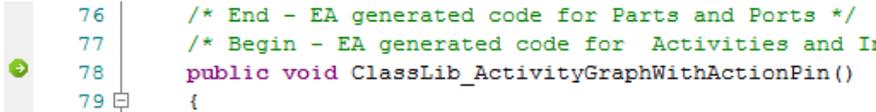

The recording markers are similar to breakpoints; however, instead of breaking execution as it does at a breakpoint, the debugger takes the action defined by the type of marker. If the marker is denoted as a recording *start point*, the debugger immediately begins to trace all executed calls from that point for the breaking thread. Recording is stopped again when either the thread that is being captured terminates or the thread encounters a recording *end point*.

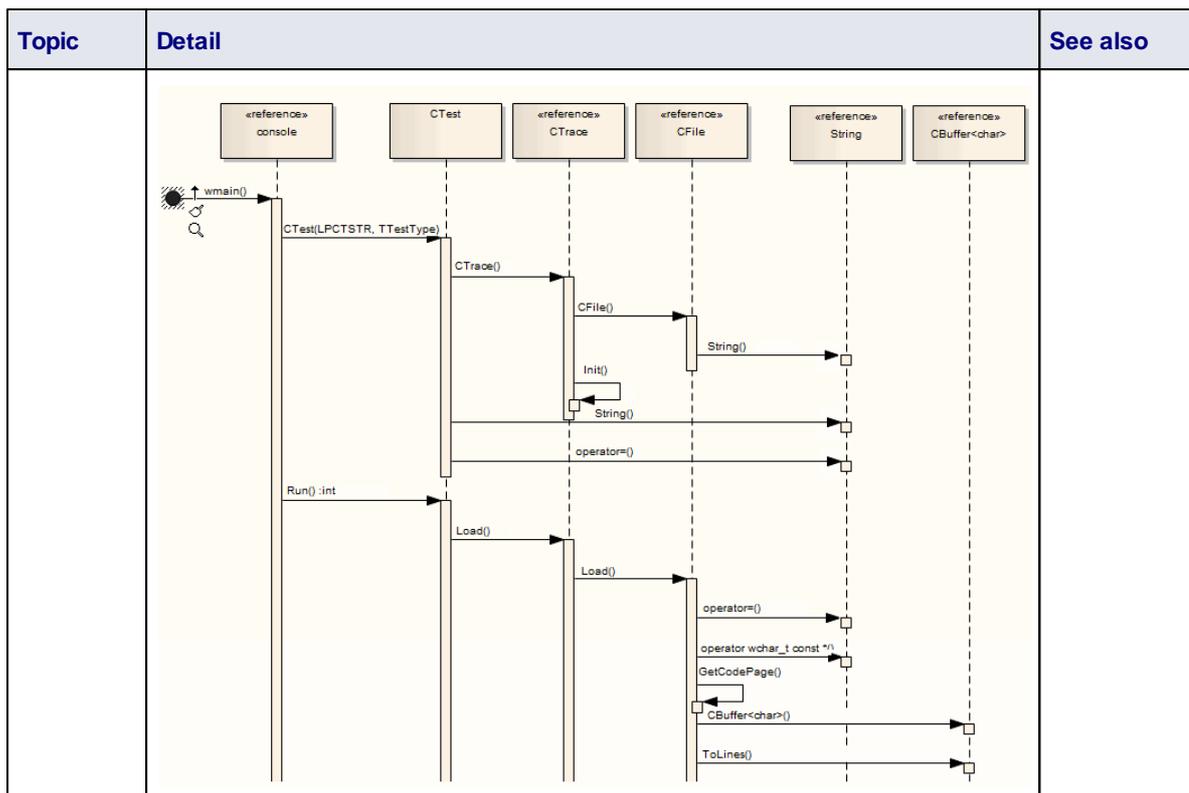

Recording markers are set in the source code editor. If you right-click on the breakpoint margin at the point to begin recording, a context menu displays that enables you to select the type of a marker.

Use To:

- Set Breakpoints and End points for recording
- Set Markers for a Single Method
- Set Stack Trace Markers

Topics:

Topic	Detail	See also
<p>Usage</p>	<p>Select the Add Start Recording Marker option, then right-click on the breakpoint margin at the point to stop recording and select the Add End Recording Marker context menu option; the markers are shown below:</p>  <pre> 17 private int m_delivery; 18 19 public ClassLib () { 20 21 } 22 23 /** 24 * 25 * @exception Throwable 26 */ 27 public void finalize () </pre> <p>When the debugger is executed it continues to run the thread, recording a stack history until either the End Recording marker is encountered or the thread terminates, unlike normal breakpoints where the debugger halts and displays the line of code</p> <p>In order to limit the amount of information being collected, you can control the stack depth being recorded.</p>	<p>Breakpoints and Markers <small>1646</small></p> <p>Analyzer Script Editor <small>1394</small></p> <p>Control Stack Depth <small>1641</small></p>
<p>Stack Auto-Capture Marker</p>	 <pre> 76 /* End - EA generated code for Parts and Ports */ 77 /* Begin - EA generated code for Activities and I 78 public void ClassLib_ActivityGraphWithActionPin () 79 { </pre> <p>(Native Code only) Stack markers enable you to capture any unique stack traces that occur at a point in an application; they provide a quick and useful picture of where a point in an application is being called from</p> <p>To insert a marker at the required point in code, right-click on the line and select the Add Stack Auto Capture Marker context menu option</p> <p>Each time the debugger encounters the marker it performs a stack trace; if the stack trace is not in the recording history, it is copied, and the application continues running</p>

14.1.3.1.1 Set Record Markers

Markers are set in the code editor. Like breakpoints, they are placed on a line of code. When that line of code executes, the Execution Analyzer evaluates starts or stops recording code execution.

Step	Action	See also
1	Open the source code to debug in the integrated source code editor;	
2	Find the appropriate code line and right click in the left margin to bring up the Analyzer context menu. Select one of the following: <ul style="list-style-type: none"> • Add Start Recording Marker • Add End Recording Marker • Add Stack Auto Capture Recording Marker 	

Step	Action	See also
	<ul style="list-style-type: none">  Add Breakpoint  Add Start Recording Marker  Add End Recording Marker  Add Stack Auto Capture Marker  Add Method Auto Record Marker  Add Tracepoint Marker  Help 	
3	Where a Start Recording Marker has been set - you need to add an End Recording Marker.	

14.1.3.2 Recording Activity for a Single Method

A **Method Auto Record** marker enables you to record activity for a particular function during a debug session. The debugger records any function calls executed after the marker point, and always stops recording when this function exits. The function marker combines a **Start Recording** marker and an **End Recording** marker in one.

Example:

```

185 ////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////
186 // CRecurrenceDlg message handlers
187
188 BOOL CRecurrenceDlg::OnInitDialog()
189 {
190     CBCGPDIALOG::OnInitDialog();
191
192     UINT nMask =
193         CBCGPDateTimeCtrl::DTM_SPIN      |
194         CBCGPDateTimeCtrl::DTM_DATE     |
195         CBCGPDateTimeCtrl::DTM_TIME     |
196         CBCGPDateTimeCtrl::DTM_CHECKBOX |
197         CBCGPDateTimeCtrl::DTM_DROPCALENDAR |
198         CBCGPDateTimeCtrl::DTM_CHECKED;
199
200     UINT nFlags = CBCGPDateTimeCtrl::DTM_CHECKED | CBCGPDateTimeCtrl::DI
201     //-----
202     // Setup date fields:

```

	Use the Save Recording History to file icon to save the recording history to an XML file	Saving Recording ^[1653]
	Use the Generate Sequence Diagram from recording icon to generate a Sequence/State diagram from the Execution Analyzer trace	Generate a Diagram ^[1652]
	Use the Testpoints icon to generate a TestPoints diagram from the Execution Analyzer trace, including Classes, Test Cuts and a Test Set that can be used with the Testpoint facility	Testpoint Management ^[1672] Generate a Diagram ^[1652]

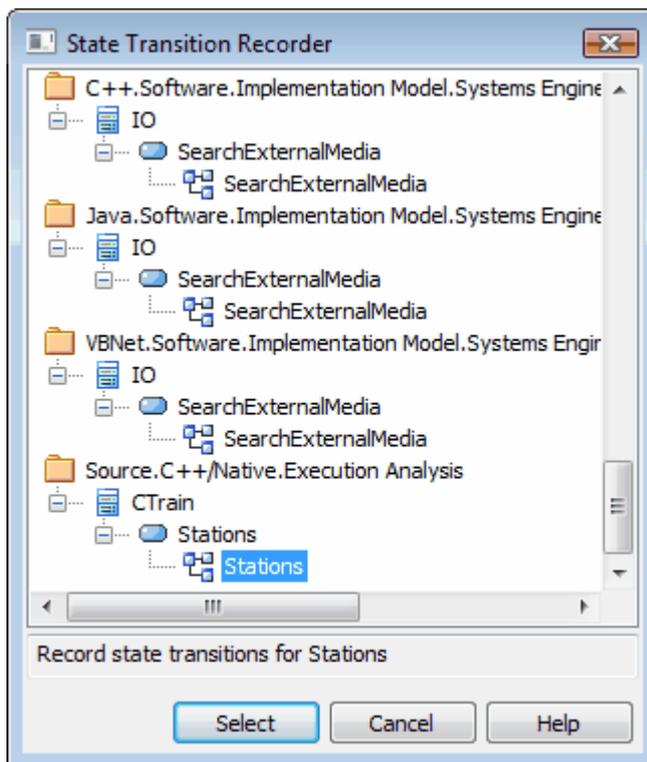

14.1.4.2 Start Recording

When you begin recording the Record dialog displays, on which you can optionally select a marker set to use and choose State Transitions to record during the session. The Execution Analyzer captures instances of the Class that the State Machine refers to and calculates the State whenever a function in the recorded stack exits.

Button	Detail
Using record set	Recording markers determine what is recorded If you have a recording set to use you can select it here
Using Statechart / Diagram	The recording can also capture changes in State transitions If you have a State Machine to use you can select it by clicking on this button

14.1.4.3 State Transition Recorder

The State Transition dialog presents a list of State Machines for the entire model. The Execution Analyzer can capture State Transitions designed on the Statechart while it is recording. When the Sequence Diagram is generated the diagram depicts not only the sequence but changes in State at the various points in the sequence. Each Class instance participating in the detection process is displayed with its own lifeline.

14.1.5 Generating Sequence Diagrams

Topics:

Topic	Detail	See also
Usage	<p>Once you have captured activity and are about to generate the diagram:</p> <ul style="list-style-type: none"> Select a package in the Project Browser where the Sequence diagram is to be stored Use the Generate Sequence Diagram from recording button on the Record & Analyze window toolbar to generate the diagram 	Recorder Toolbar <small>1648</small>

14.1.5.1 The Recording History

All information recorded as a result of the application encountering recording markers set by the user is held in the Record & Analyze window.

Topics:

Topic	Detail	See also
Columns	<p>The columns in this Record & Analyze window are as follows:</p> <ul style="list-style-type: none"> Sequence - The unique sequence number Threads - The operating system thread ID Delta - The elapsed thread CPU time since the start of the sequence Method - There are two Method columns: the first shows the caller for a call or for a current frame if a return; the second shows the function called or function returning Direction - <i>Stack Frame Movement</i>, can be <i>Call</i>, <i>Return</i>, <i>State</i>, <i>Breakpoint</i> or <i>Escape</i> (<i>Escape</i> is used internally when producing a Sequence diagram, to mark the end of an iteration) Depth - The stack depth at the time of a call; used in the generation of Sequence diagrams State - The state between sequences Source - There are two Source columns: the first shows the source filename and line number of the caller for a call, or for a current frame if a return; the second shows the source filename and line number of the function called or function returning Instance - There are two Instance columns; these columns only have values when the Sequence diagram produced contains State transitions. The values consist of two items separated by a comma - the first item is a unique number for the instance of the Class that was captured, and the second is the actual instance of the Class <p>For example: supposing a Class <i>CName</i> has an internal value of 4567 and the program created two instances of that Class; the values might be:</p> <ul style="list-style-type: none"> 4567,1 	

Topic	Detail	See also
	<ul style="list-style-type: none"> 4567,2 <p>The first entry shows the first instance of the Class and the second entry shows the second instance</p>	
Toolbar	The Record & Analyze window toolbar provides a range of facilities for controlling the recording of the execution of an Analyzer script	Recorder Toolbar ^[1648]

Notes:

- The checkbox against each number is used to control whether or not this call should be used to create a Sequence diagram from this history
- In addition to enabling or disabling the call using the checkbox, you can use context menu options to enable or disable an entire call, all calls to a given method, or all calls to a given Class

14.1.5.2 Generate a Diagram**Topics:**

14.1.5.3 Diagram Features

When you generate a Sequence diagram, it includes the following features:

Feature	Detail	See also
References	<p>When the Visual Execution Analyzer cannot match a function call to an operation within the model, it still creates the sequence but also creates a reference for any Class that it cannot locate</p> <p>It does this for all languages</p>	
Fragments	<p>Fragments displayed in the Sequence diagram represent loops or iterations of a section(s) of code</p> <p>The Visual Execution Analyzer attempts to match function scope with method calls to as accurately as possible represent the execution visually</p>	
States	<p>If a State Machine has been used during the recording process, any transitions in State are presented after the method call that caused the transition to occur</p> <p>States are calculated on the return of every method to its caller</p>	

14.1.5.4 Saving Recording

This topic explains how to save a recorded sequence to an XML file, and retrieve it.

Action	Detail	See also
To Save	To save a recorded sequence to an XML file, click on the sequence and on the toolbar Save icon ()	Recorder Toolbar ^[1648]
To Access	To access an existing sequence XML file, either: <ul style="list-style-type: none"> • Click on the toolbar Open icon (), or • Right-click on a blank area of the screen and click on the Load Sequence From File context menu option The Windows Open dialog displays, from which you select the file to open	Recorder Toolbar ^[1648]

14.1.6 Add State Transitions

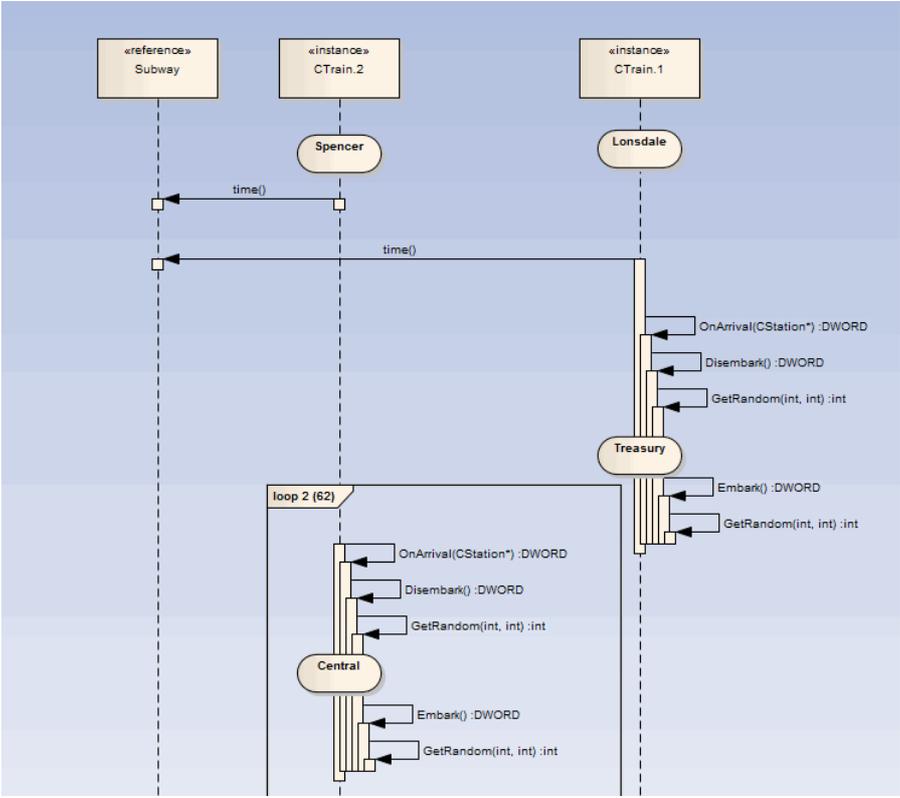

This section describes how you can generate Sequence diagrams that show transitions in state as a program executes.

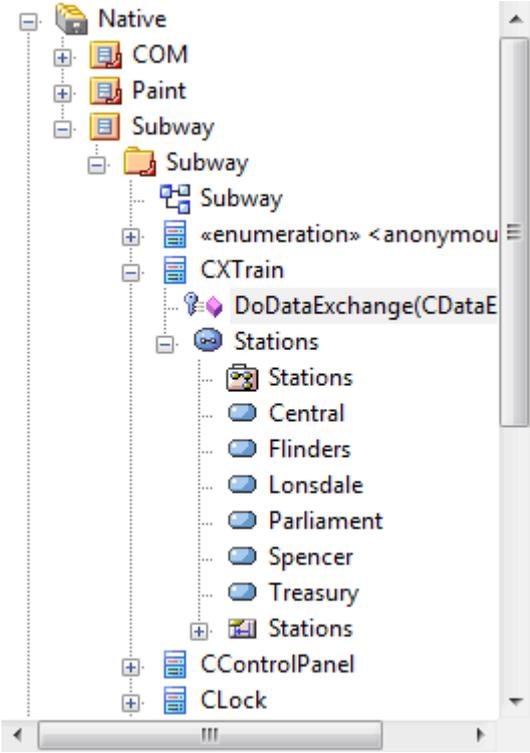

Topic	Link
Setup for capturing changes	Setup for Capturing State Changes ^[1653]
State change during the execution of an application	The State Machine ^[1655]
Recording and Mapping state changes	Recording and Mapping State Changes ^[1657]

14.1.6.1 Setup for Capturing State Changes

You can generate Sequence diagrams that show transitions in state as a program executes. The illustration below shows a project that has, in its State Machine, a number of States that correspond to stations in the Melbourne underground railway system.

Topics:

Topic	Detail	See also
<p>State Transitions</p>	 <p>Showing State transitions on your debug-generated Sequence diagrams is optional; you set an option in the package script associated with the Class for which you intend to record States</p> <p>You then create a State Machine under the Class, and on the State Machine you create the State elements that correspond to any states to be captured for your Class</p> <p>The debugger evaluates your States by checking constraints on the States you create; the States on this diagram are then used by the debugger and State transitions are incorporated into the diagram</p>	
<p>Example</p>		

Topic	Detail	See also
	 <p>This figure shows the Class <i>CXTrain</i> with a State Machine called <i>Stations</i>; it has a child diagram also called <i>Stations</i>, on which the States {<i>Central</i>, <i>Flinders</i>, <i>Lonsdale</i>...} are placed</p>	

Notes:

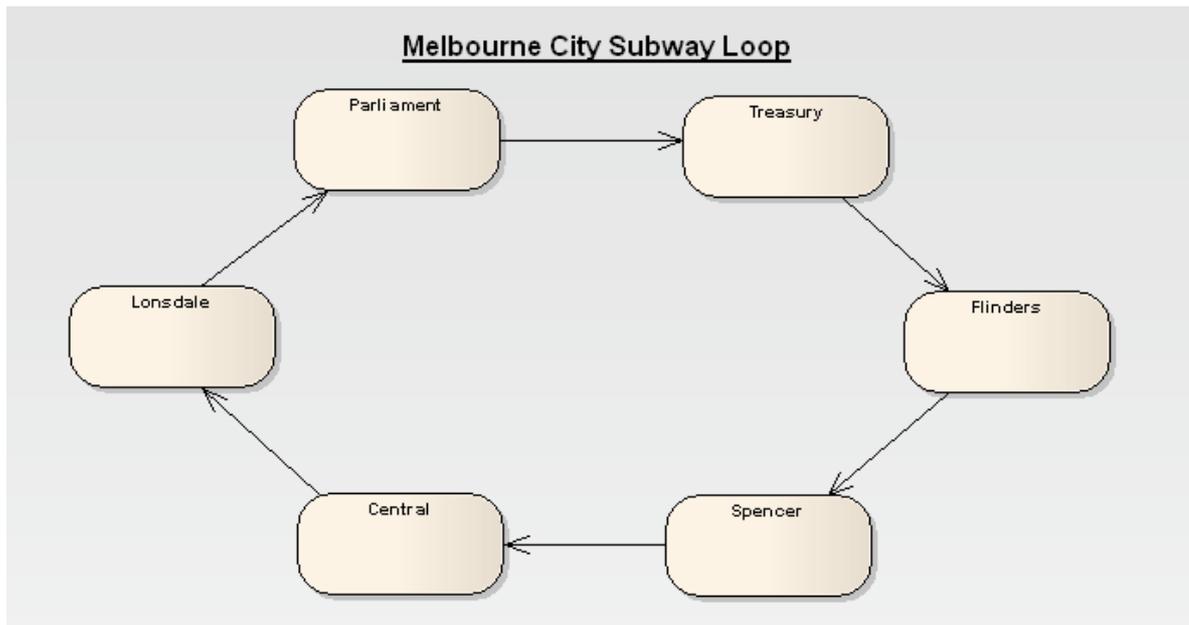

- If you do not have a package script for the Class or package you must create one; Sequence diagrams can only be generated for a package that has been configured for debug

14.1.6.2 The State Machine

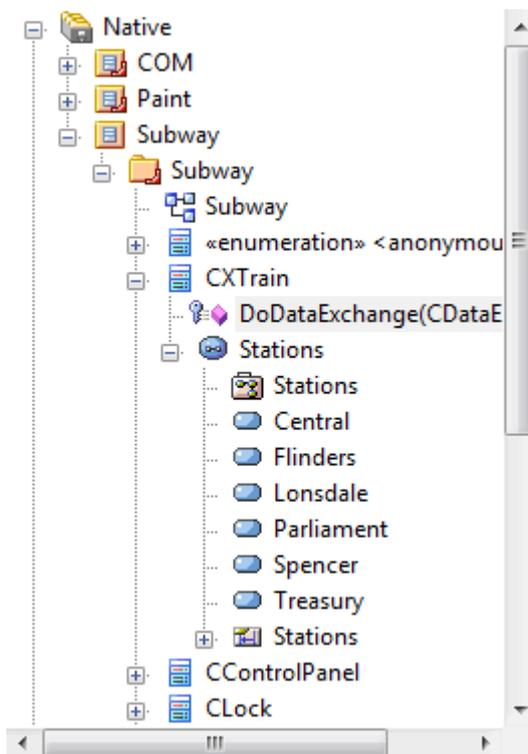

A State Transition diagram can be used to illustrate how States change during the execution of an application. The Visual Execution Analyzer can build a State Machine to model all the valid system states and explicitly describe the transitions between each state.

The diagram below is a State Machine that shows the different States within the Melbourne Underground Loop subway system. A train traveling on the subway network can be stopped at any of the stations represented on the State Machine.

Example:

This State Machine diagram is a child of the *CXTrain* Class.

14.1.6.3 Recording and Mapping State Changes

14.2.1 System Requirements

Topics:

Topic	Detail	See also
Prerequisites	<p>The Profiler window becomes available when a model is opened</p> <p>Options on the Profiler window toolbar enable you to attach to an existing process, or to launch a new application if a Package Script been specified</p>	Profiling Native Applications ^[1658] Getting Started ^[1659]
Supported	Enterprise Architect supports profiling on native Windows	

Topic	Detail	See also
Platforms	<p>applications (C, C++ and Visual Basic) compiled with the Microsoft™ native compiler, where an associated PDB file is available; select Microsoft Native from the list of debugging platforms in your package script</p> <p>The Profiler can sample both Debug and Release configurations of an application, providing the PDB for each executable exists and is up to date</p>	

14.2.2 Getting Started

Access: [Analyzer](#) | [Profile](#)

Topics:

Topic	Detail	See also
Abstract	<p>The Profiler operates by taking samples of a process at intervals of up to 250 milliseconds</p> <p>At these intervals the Profiler interrupts the process and collects stack information for all threads running at that time; this information is sent back to Enterprise Architect where it is collected sorted and stored</p> <p>You can pause and resume profiling at any time during the session, or clear any sample data collected and begin again</p> <p>If you stop the Profiler and the process is still running, you can quickly attach to it again</p>	

Toolbar Options:

Icon	Action	See Also
	(When an application is configured for the package) create the Profiler process, which launches the configured application	Managing Scripts <small>[1392]</small>
	Profile an application that is already running	
	When the application is running, pause and resume sample capture Pausing sampling enables the Report and Erase buttons	
	Stop the Profiler process; if any samples have been collected, the Report button is enabled	
	Generate a report on the current number of samples collected	Profiling Native Application <small>[1658]</small>
	Set the interval, in milliseconds, at which samples are taken of the target process; the range of possible values is 1 - 250	Setting Options <small>[1661]</small>

Icon	Action	See Also
	Set Profiler options, using a drop-down menu; the options are: <ul style="list-style-type: none"> • Load Report from Disk - load and display a previously-generated report from an XML disk file • Analyzer Scripts (Shift+F12) - display the Execution Analyzer window to enable creation or editing of scripts and debug configuration • Start Sampling Immediately - begin sample collection immediately upon either process start (main thread entry point executed) or attachment of process by Profiler • Capture Debug output - capture any appropriate debug output and redirect it to the Enterprise Architect Output window • Stop Process on Exit - select to terminate the target process when the Profiler is stopped 	Build ^[1415]
	Erase the collected data	
	Display the Help topic for this window	

14.2.3 Start & Stop the Profiler

Topics:

Topic	Detail	See also
Usage	<p>For most debugging operations it is necessary to have first configured a Package Script that typically defines the application to build, test and debug, and any sequence recording options</p> <p>It is possible to use the Profiler without doing any of this by using the Attach to Process button</p> <p>If the application to profile is the one defined in the current package, use the Launch button</p> 	
Buttons	 (When an application is configured for the package) create the Profiler process, which launches the configured application	Managing Scripts ^[1392]
	 Profile an application that is already running	
	 Stop the Profiler process	

14.2.4 Profiler Operation

Topics:

Topic	Detail	See also
Usage	<p>Enterprise Architect creates a Profiler process whenever you click on the Launch or Attach to Process button on the Profiler window toolbar; this process operates by collecting samples from the stacks of every thread in the target process</p> <div data-bbox="349 633 1195 817" data-label="Diagram"> <pre> classDiagram class EA class Profiler class TargetApplication TargetApplication --> Profiler : «flow» Profiler --> EA : «flow» </pre> </div> <p>The sampler process exits if you click on the Stop button, if the target application terminates, or if you close the current model</p> <p>You can turn sample collection on and off at any time during a session</p> <p>When sampling is turned on or resumed, the Profiler process becomes active and samples are collected from the target; resuming sampling collects completely new samples</p> <p>The Profiler process idles if sampling is turned off or paused during a session. The Report and Erase buttons then become enabled</p> <p>Click on the Report button to produce a call graph summary similar to that in the <i>Profile Native Applications</i> topic; this report can be saved to file</p> <p>Click on the Erase button to discard any samples currently collected for the target</p>	<p>Profile Native Applications </p>

14.2.5 Setting Options

Topics:

Topic	Icon	Detail	See also
Interval		Set the interval, in milliseconds, at which samples are taken of the target process; the range of possible values is 1 - 250	
Profile Options		<p>Set Profiler options, using a drop-down menu; the options are:</p> <ul style="list-style-type: none"> • Start Sampling Immediately - begin sample collection immediately upon either process start (main thread entry point executed) or attachment of process by Profiler • Capture Debug output - capture any appropriate debug output and redirect it to the Enterprise Architect Output window • Stop Process on Exit - select to terminate the target process when the Profiler is stopped 	

14.2.6 Save and Load Reports

Topics:

14.3 Object Workbench

This section describes the Object Workbench, a tool in Enterprise Architect Debugging that enables you to create your own variables and invoke methods on them.

Topic	Link
Setup requirements for the workbench	Workbench Setup <small>[1663]</small>
Overview - your methods can be invoked to record Stack trace and produce Sequence diagrams	How it works <small>[1663]</small>
Description of workbench variables	Workbench Variables <small>[1665]</small>
How to create workbench variables	Create Workbench Variables <small>[1665]</small>
How to invoke methods	Invoke Methods <small>[1666]</small>

14.3.1 Workbench Setup

This topic describes the requirements for setting up the Object Workbench on Java and Microsoft .NET.

Java Workbench:

To use the Object Workbench you must have created an Analyzer Script for the package and configured the Debugger.

The Java workbench uses the Virtual Machine settings configured in the Analyzer Script Debug page to create the JVM.

Microsoft .NET Workbench:

You must have created an Analyzer Script for the package and configured the Debugger.

The .NET workbench requires an assembly, which is used to create the workbench items. You specify the path to the assembly on the Workbench page of the Analyzer Script.

Debug Platform: Microsoft Native

Microsoft .NET

The specified assembly is used to create the Workbench Objects.

Java

The workbench uses the same runtime options defined in the debugging section.

Native

Not supported.

The Workbench Page of the Analyzer Script

14.3.2 How it Works

The Workbench is a tool in Enterprise Architect Debugging, enabling you to create your own variables and invoke methods on them. Stack trace can be recorded and Sequence diagrams produced from the invocation of such methods. It provides a quick and simple way to debug your code.

Topics:

Topic	Detail	See also
Platforms Supported	<p>The Workbench supports the following workbench platforms:</p> <ul style="list-style-type: none"> • Microsoft .NET (version 2.0 or later) • Java (JDK 1.4 or later) <p>The Workbench does not currently support the creation of Class instances written in native C++, C or VB</p>	
Mode	<p>The Workbench operates in two modes:</p> <ul style="list-style-type: none"> • Idle mode - When the Workbench is in idle mode, instances can be created and viewed and their members inspected • Active mode - When methods are invoked on an instance, the Workbench enters Active mode and the displayed variables change if the debugger encounters any breakpoints; if no breakpoints are set, then the variables do not change and the Workbench immediately returns to Idle mode 	
Logging	<p>The results of creating variables and the results of calls on their methods are displayed in the Debug Output window</p>	<p>Show Output From Debugger [1446]</p>

Learn More:

- [Create Workbench Variables](#) [1665]
- [Invoke Methods](#) [1666]

14.3.3 Workbench Variables

You can create (and delete) workbench variables from any Class in your model. When you do so, you are asked to name the variable. It then displays in the Workbench window, showing the variable in a hierarchy and displaying its type and value and those of any members.

Topics:

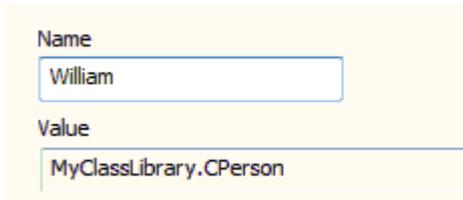

Topic	Detail	See also
Workbench Requirements	<ul style="list-style-type: none"> .NET framework version 2 is required to workbench any .NET model The package from which the variable is created must have a debugger configured 	Setup For Debugging ^[1417]
Constraints (.NET)	<ul style="list-style-type: none"> Members defined as <i>struct</i> in managed code are not supported Classes defined as <i>internal</i> are not supported 	
Delete Workbench Variables	<p>You can delete variables using the Delete shortcut menu on any instance on the Workbench</p> <p>If all instances are deleted, the debugger is shut down and the Workbench window is closed</p>	

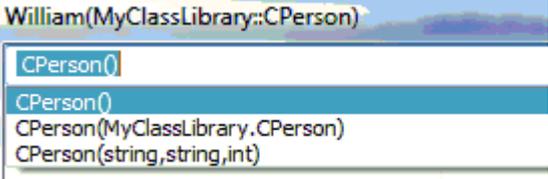

14.3.4 Create Workbench Variables

This topic explains how to create a workbench instance for a Class element.

Access: **Project Browser Class context menu | Execution Analyzer | Create Workbench Instance of Class (Ctrl+Shift+J)**

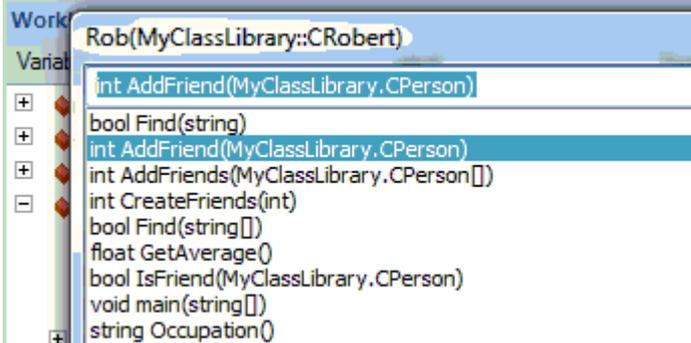

Topics:

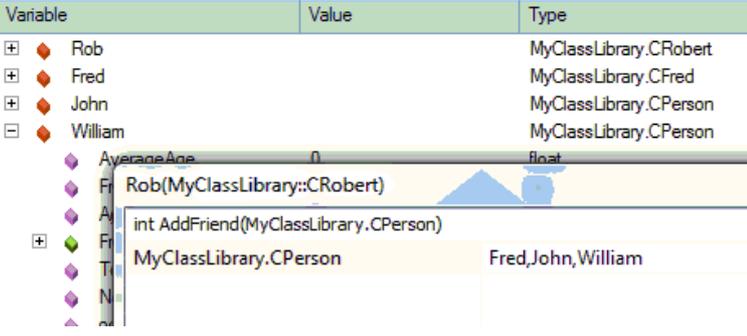

Topic	Detail	See also
Naming the Workbench	<p>Select the Create Workbench Instance of Class option</p> <p>The Workbench dialog displays</p>  <p>Type in a name for the variable; each instance name must be unique for the workbench</p>	
Choosing a Constructor	<p>After naming the variable, select the constructor to use</p> <p>If you do not define a constructor, or define a single constructor taking no arguments, the default constructor or the defined constructor is automatically invoked</p> <p>Otherwise the following dialog displays; select the constructor from the drop-</p>	

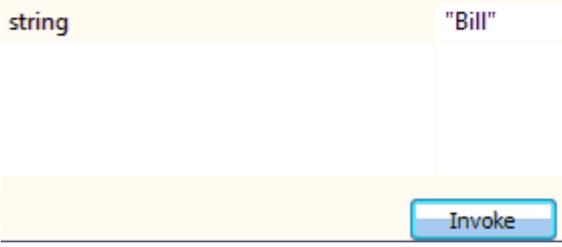

Topic	Detail	See also
	<p>down list and fill in any parameters required</p> 	

14.3.5 Invoke Methods

Topics:

Topic	Detail	See also
Access	On the Workbench window, right-click on the instance on which to execute a method, and select the Invoke context menu option	
Choose Method	<p>A list of methods for the type are presented in a dialog; select a method from the list and click on the Invoke button</p> <p>Note that all methods listed are public; private methods are not available</p> 	
Supply Arguments	<p>In the example, the instance or variable <i>Rob</i> has been created, of type <i>MyClassLibrary.CRobert</i>, and the method <i>AddFriends</i> invoked that takes an array of <i>CPerson</i> objects as its only argument</p> <p>You now supply to it three other Workbench instances: <i>Fred</i>, <i>John</i> and <i>William</i></p>	

Topic	Detail	See also						
								
Arguments	<p>In the dialog above, type any parameters required by the constructor:</p> <ul style="list-style-type: none"> • Literals as arguments <ul style="list-style-type: none"> • Text: abc or "abc" or "a b c" • Numbers: 1 or 1.5 • Objects as arguments <p>If an argument is not a literal then you can supply it in the list only if you have already created an instance of that type in the workbench; you do this by typing the name of the instance as the argument</p> <p>The debugger checks any name entered in an argument against its list of workbench instances, and substitutes that instance in the actual call to the method</p> • Strings as arguments <p>Surrounding strings with quotes is unnecessary as anything you type for a string argument becomes the value of the string; for example, the only time you should surround strings with quotes is in supplying elements of a string array, or where the string is equal to the name of an existing workbench instance</p> <pre> "A b c" "a b \$ % 6 4" A b c d As 5 7) 2 === 4 </pre> • Arrays as arguments <p>Enter the elements that compose the array, separated by commas</p> <table border="0" data-bbox="555 1803 1177 1899"> <tr> <td>Type</td> <td>Arguments</td> </tr> <tr> <td>String()</td> <td>one,two,three,"a book","a bigger book"</td> </tr> <tr> <td>CPerson()</td> <td>Tom,Dick,Harry</td> </tr> </table> <p>If you enter text that matches the name of an existing instance, surround it in quotes to avoid the debugger passing the instance rather than a string</p> 	Type	Arguments	String()	one,two,three,"a book","a bigger book"	CPerson()	Tom,Dick,Harry	
Type	Arguments							
String()	one,two,three,"a book","a bigger book"							
CPerson()	Tom,Dick,Harry							

Topic	Detail	See also
	 <p>The screenshot shows a code editor with the method signature <code>void SetName(string)</code>. Below it, a parameter <code>string</code> is highlighted in yellow, and the value <code>"Bill"</code> is entered in a text box. At the bottom, an <code>Invoke</code> button is visible.</p>	
Invoke	Having chosen the constructor and supplied any arguments, click on the Invoke button to create the variable Output confirming this action is displayed in the Output tab	Show Output From Debugger <small>1446</small>

14.4 Unit Testing

Enterprise Architect supports integration with unit testing tools in order to make it easier to develop good quality software.

In sequence:

- Enterprise Architect helps you to create test Classes with the **JUnit** and **NUnit** transformations
- You set up and run a **test script** against any package
- All test results are automatically recorded inside Enterprise Architect

Learn More:

- [JUnit Transformation](#)^[1321]
- [NUnit Transformation](#)^[1323]
- [Setup Unit Testing](#)^[1669]
- [Add Testing Command](#)^[1669]
- [Run Unit Tests](#)^[1670]
- [Record Test Results](#)^[1670]

14.4.1 Set Up Unit Testing

Topics:

Topic	Detail	See also
Define Test Cases	<p>Firstly the appropriate tests must be defined; Enterprise Architect is able to help with this</p> <p>By using the JUnit or NUnit transformations and code generation you can create test method stubs for all of the public methods in each of your Classes</p> <p>The following is an <i>NUnit</i> example in C# that is followed through the rest of this topic, although it could also be any other .NET language, or Java and JUnit</p> <pre> (Test Fixture) public class CalculatorTest { (Test) public void testAdd(){ Assert.AreEqual (1+1, 2); } (Test) public void testDivide(){ Assert.AreEqual (2/ 2, 1); } (Test) public void testMultiply(){ Assert.AreEqual (1* 1, 1); } (Test) public void testSubtract(){ Assert.AreEqual (1- 1, 1); } } </pre>	<p>Adding Testing Command^[1451]</p> <p>JUnit Transformation^[1321]</p> <p>NUnit Transformation^[1323]</p> <p>Generate Source Code^[1490]</p>

Topic	Detail	See also
	This code can be reverse engineered into Enterprise Architect so that Enterprise Architect can record all test results against this Class	
Set up the Test Scripts	<p>Once the unit tests are set up, you can then set up the Build and Test scripts against a package, to run the tests</p> <p>The sample above can be called by setting up an Analyzer script with a command similar to the following:</p> <pre>" C : \ P r o g r a m F i l e s \ N U n i t \ b i n \ n u n i t - c o n s o l e . e x e " p i n \ d e b u g \ C a l c u l a t o r . e x e "</pre> <p>If Enterprise Architect is to handle unit testing, it is important that you select the Capture Output checkbox and select the appropriate Output Parser for the testing; without doing this you cannot see the program output and therefore you cannot open the source at the appropriate location</p>	Add Commands <small>[1415]</small>

14.4.2 Run Unit Tests

Access: [Analyzer](#) | [Test](#) | [Run Test Script](#)

Topics:

Topic	Detail	See also
Run a Unit Test	<p>Run the NUnit test script you set up previously</p> <p>The results of NUnit are displayed in the Output window, identifying which tests have run and which of these have failed</p> <p>The results also show which method failed and the file and line number the failure occurred at</p> <p>Double-click on an error message; Enterprise Architect opens the editor to that line of code, enabling you to quickly find and fix the error</p> <p>Enterprise Architect also records the run status of each test</p>	Record Test Results <small>[1670]</small>

14.4.3 Record Test Results

Enterprise Architect is able to automatically record all results from tests through a testing script in Enterprise Architect.

Topics:

Topic	Detail	See also
Process	<p>In order to use this feature, you must reverse engineer the test Class into the package containing your test script</p> <p>Once your model contains your test Class, on the next run of the test script Enterprise Architect adds Test Cases to the Class for each</p>	Set Up Unit Testing <small>[1669]</small> Importing Source Code <small>[1508]</small>

Topic	Detail	See also
	<p>test method found; on this and all subsequent test runs all Test Cases are updated with the current run time and whether they passed or failed, as shown below:</p> <div data-bbox="475 456 743 824" style="border: 1px solid black; padding: 5px; margin: 10px auto; width: fit-content;"><p style="text-align: center;">Calculator Test</p><ul style="list-style-type: none">+ testAdd() : void+ testDivide() : void+ testMultiply() : void+ testSubtract() : void<p style="text-align: center;">test scripts</p><ul style="list-style-type: none">Unit : (Pass) testAddUnit : (Pass) testDivideUnit : (Pass) testMultiplyUnit : (Fail) testSubtract</div> <p>The error description for each failed test is added to any existing results for that Test Case, along with the current date and time</p> <p>Over time this provides a log of all test runs where each Test Case has failed, which can then be included in generated documentation, resembling the following:</p> <pre>Failed at 05- Jul - 2006 1: 02: 08 PM expected: <0> but was: <1> Failed at 28- Jun- 2006 8: 45: 36 AM expected: <0> but was: <2></pre>	<p>Run Unit Tests [1670]</p>

14.5 Testpoint Management

Testpoint Management provides the facility to test and pass or fail application tasks, viewing test results in real time as the program executes and results are saved.

Tests	Id	Invariant	Pre	Post	Author	Status	Evals	Passes	Fails

The image shows a Testpoint run in progress. The example was produced using the Example Model that ships with Enterprise Architect

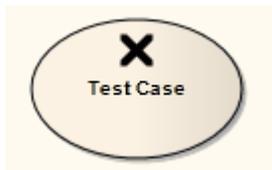

Topics:

Topic	Detail	See also
Overview	<p>You define tests as Class invariants, and as pre/post conditions on operations</p> <p>Testpoint design and management is performed on a Test Domain diagram, on which you define constraints and group them into sets, which in turn can form suites</p> <p>The Testpoint interface is contextual, and when an object (Class, Test Cut, Test Set, Test Suite) is selected, the constraints for that object are displayed</p> <p>In the Testpoint system, the rules that define task behaviors are defined within the model and do not form part of any code base, which has a number of advantages - changing a test condition in other systems can require that the application be re-built; in Enterprise Architect you could stop the run, change a constraint and start the run again without re-building the project</p>	
Test Domain Diagram	<p>A Test Domain diagram is a particular diagram designed for use with the Testpoint facility</p> <p>A Test Domain diagram provides specific elements that can aid in the logical composition of the Tests into Test sets and suites</p> <p>You can perform a Testpoint run on an entire Suite, a single Set or</p>	<p>Test Domain Group^[567]</p> <p>Test Cut^[1675]</p> <p>Test Set^[1675]</p>

Topic	Detail	See also
	an individual Class	Test Suite ^[1676]
Testpoint Class	<p>Test conditions are always defined on a Class; invariants are created for the Class itself, and pre- and post-conditions are defined on its operations</p> <p>These conditions can be aggregated later into sets, but the Classes are the building blocks upon which any sets you create are built</p>	
Constraints	<p>The Testpoint facility is based on a programming-by-contract model</p> <p>The Execution Analyzer uses constraints that you define for a Class and its methods:</p> <ul style="list-style-type: none"> • A Class invariant is evaluated by the Analyzer whenever a method called on an object of the Class completes • Pre-conditions defined for a method are evaluated when the method is first called; similarly, Post-conditions are evaluated (at the same time as any Class invariant) when the method completes <p>In the Testpoint facility, constraints are composed using member and local variables in expressions separated by operands; precedence can be achieved through the use of parentheses, which also permits the construction of complex expressions - you can specify any variable that would be in scope at the time</p> <p>Elements and members of elements can also form part of the constraint; almost all equivalence operands are supported for primitive types and strings</p>	
Testpoint Constraints	<p>An <i>invariant</i> defines the rules or constraints of a Class; it is expected that no objects of the Class nor its methods can break this constraint, thus preserving the state of the object</p> <p>In the Testpoint facility, constraints are composed in much the same way as conditions are written in code; they rely on and are tied ultimately to the named attributes of the Class</p> <p>The Execution Analyzer can take a single invariant defined for a Class and test it against every invocation of any method on any instance of that Class; the results can be seen during real time in the Testpoints window</p>	The Testpoints Window ^[1676]
Trace Statements	<p>Trace statements are used to output messages during the execution of a program; the Execution Analyzer provides this facility in:</p> <ul style="list-style-type: none"> • Debugging through the use of Tracepoints and • Testing through the use of Testpoints <p>In Testpoints, a trace statement can be associated with a pre- or post- condition; whenever the condition is evaluated, the trace statement is output</p> <p>You can also group trace statements by level; when you perform a Testpoint run, you can choose the level of trace to be output</p> <p>Output can be directed to the Testpoints tab of the Output window or to a file, as configured in the Analyzer script for the parent package</p> <p>In debugging, trace statements are associated with code breakpoints</p> <p>You can include the values of variables in trace statements, by prefixing the variable name with a special token that lets the</p>	The Output Window ^[127] Managing Scripts ^[1392]

Topic	Detail	See also
	debugger know it is not a part of the text; the available tokens are: <ul style="list-style-type: none"> • \$ - when the variable is to be interpreted or printed as a string • @ - when the variable is a primitive type (int, double, char) Variables can be qualified - that is, the members of a variable can be printed You separate member names with a period character ('. '); for example: <i>The value of member c is \$a.b.c</i>	

14.5.1 Test Case

Description:

A *Test Case* is a stereotyped Use Case element. You might use it to extend the facilities of the Testing window, by applying element properties and capabilities to the tests of a feature represented by another element or - more appropriately - set of elements. That is, you can define in one go - in the Testing window for the Test Case element - the details of the tests that apply to each of several elements, instead of recording the details separately in each element.

Within the Test Case element properties you can define test requirements and constraints, and associate the test with test files. You can also link the element to Document Artifacts or (in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions) directly to linked documents, such as a Test Plan.

The Test Case element enables you to give greater visibility to tests, in the Project Browser, Diagram List, Package Browser, Model Search, Relationship Matrix, Traceability window and reports.

The Test Case element is available through the Use Case and Maintenance pages of the Toolbox.

Toolbox Icon:

14.5.2 Test Cut

Description:

A Test Cut element is a stereotyped Object element.

A task, such as 'Print', might involve operations on different Classes. In order to create a 'Print' test, you would want to include only the 'Print' operations of these Classes and exclude any other operations.

A Test Cut enables you to capture only the operations that represent the behavior (in this case, 'Print') defined for a single Class. You might then place the Test Cut from each of several Classes into a single task as a Test Set.

When you drag a Test Cut element onto a Test Domain diagram, you create a Dependency relationship with the required Class element. As a result, when you select the *Test Cut* element on the Testpoints Window, the operations of the *Class* are listed in the window, each with a checkbox. You then select the checkbox against each Class operation to include in the Test Cut.

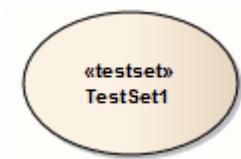

Toolbox Icon:

14.6 Model Simulation

This section explains how to use the Visual Execution Analyzer to simulate the execution of behavior models. It covers the following topics:

Topic	Link
Overview of the Model Simulator	How It Works ^[1681]
How to set up simulation	Set Up Simulation ^[1681]
How to activate a simulation script	Activate a Simulation ^[1682]
How to run the model simulation	Run Model Simulation ^[1683]
How to set up and use breakpoints	Using Simulation Breakpoints ^[1684]

14.6.1 How It Works

The Model Simulator is a tool in Enterprise Architect's Visual Execution Analyzer, enabling you to simulate the execution of conceptual model designs containing behavior. It provides a quick and simple way to verify your design's behavior for logical correctness.

Topics:

Topic	Detail	See also
Platforms Supported	<p>The Model Simulator supports the following simulation platform:</p> <ul style="list-style-type: none"> UML Basic <p>The Model Simulator currently supports the execution of Activity, Interaction and State Machine models</p>	Set Up Simulation ^[1681]

Learn More:

- [Set Up Model Simulation](#) ^[1681]
- [Run Model Simulation](#) ^[1683]

14.6.2 Set Up Simulation

Setting up a model for simulation is a simple process. An Execution Analyzer script is configured for the package containing the required simulation model.

To configure a simulation execution script, you must select the package on the Project Browser, Package Browser, Diagram List or Model Search.

Access: [Project Browser Package Context Menu | Execution Analyzer | Analyzer Scripts...](#)

How To:

To set up a model for simulation, follow the steps below:

Step	Action	See Also
1	In the Execution Analyzer window, click on the New toolbar icon (second from the left)	
2	Select the required package in the Browse Project dialog and click on the OK button	
3	In the Execution Analyzer dialog, select the Simulation page	
4	In the Entry Point field, click on the (...) button and select the required entry point for the simulation, and the required Activity, Interaction or State Machine to simulate	
5	In the Platform field, click on the drop-down arrow and select UML Basic	
6	If required, select the Record Execution checkbox to record the simulation session	Control the Recording Session <small>1648</small>
7	Click on the OK button to save changes	

Notes:

- If you do not specify an entry point, the simulator attempts to simulate the entire package
- All simulation elements and relationships must reside within the package configured for simulation

- [Activate Simulation Script](#) 1682
- [Run Model Simulation](#) 1683
- [Using Simulation Breakpoints](#) 1684

14.6.3 Activate Simulation Script

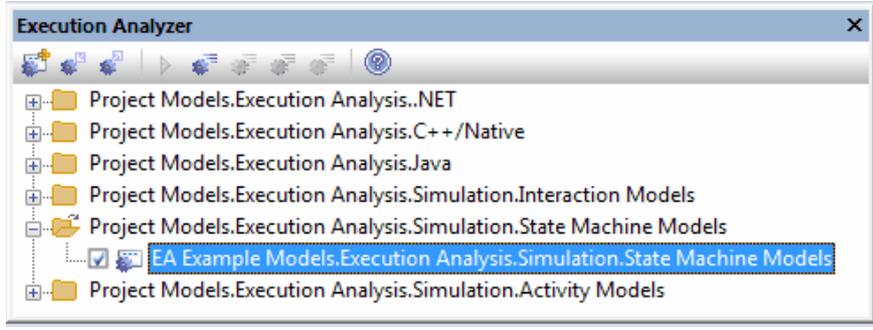

An Execution Script is configured for a model package defining the simulation parameters. To run the simulation you must first activate the execution script on the Execution Analyzer window.

Access: [Project Browser Package Context Menu | Execution Analyzer | Analyzer Scripts...](#)

How to:

To activate a simulation script for execution, follow the steps below:

Step	Action	See Also
1	In the Execution Analyzer window, select the required execution script	

Step	Action	See Also
		
2	Click on the checkbox to the left of the script to activate it	
3	Execute the simulation using the Analyzer Simulation menu option	Run Model Simulation ^[1683]

Notes:

- The simulation tool only becomes active when a valid simulation execution script is activated

Learn More:

- [Set Up Simulation](#) ^[1681]

14.6.4 Run Model Simulation

You run a model simulation through the Simulation window, by executing the activated simulation script configured for the model package.

Access: **Analyzer | Simulation > Output**

Topics:

Topic	Detail	See also
Abstract	<p>The simulation executes the model step-by-step, enabling you to validate the logic of your behavior model; the simulation automatically highlights the execution step in the model's diagram</p> <p>If a branch is encountered in the execution, the simulator prompts you to choose the appropriate path to take in your execution</p> <p>The Simulation window toolbar icons are explained in the table below</p>	Activate Simulation Script ^[1682]

Icon	Action	See Also
	Start the simulator using the activated simulation script	Activate Simulation Script ^[1682]
	Pause the simulation	

Icon	Action	See Also
	When the simulation is paused, step over, step in and step out to control the simulator's execution at the required step in the model simulation	
Slider	Vary the runtime speed of the simulation	
	Stop the simulation	

Notes:

- The Simulation tool only becomes active when a valid simulation Execution Script is activated

15 Testing

This section discusses quality control in your project with Enterprise Architect, describing:

Topic	Link
Model Validation Checks - Used to check UML elements, diagrams or packages against known UML rules (identified in configuring validation) and constraints defined within the model, using the Object Constraint Language (OCL)	Model Validation Checks ^[1688]
Testing - Enterprise Architect enables you to create and manage test scripts for model elements, covering unit, integration, scenario, system and acceptance tests	Testing ^[1694]
Testpoint Management - provides the facility to pass or fail application tasks, viewing test results in real time as the program executes and results are saved	TestPoint Management ^[1672]
Integration with the unit testing tools JUnit and NUnit	Unit Testing ^[1669]

15.1 Model Validation

You use Model Validation to check UML models against known **UML rules** (which you identify in **configuring validation**) as well as any constraints defined within the model, using the Object Constraint Language (OCL). You can run Model Validation against a single UML element, a diagram or an entire package.

Access: **Project | Model Validation | Validate Selected (Ctrl + Alt + V)**

Topics:

Topic	Detail	See also
Validating	Validating a UML: <ul style="list-style-type: none"> • Element validates the element and its children, features (attributes and operations) and relationships (connectors) • Diagram validates the diagram itself (for correctness) as well as any elements and connectors within the diagram • Package validates the package and all sub-packages, elements, connectors and diagrams within it 	
Example - Model Violation	<p>The following UML diagram contains several basic violations:</p> <p>If you run Model Validation on this diagram, Enterprise Architect displays the following violations in the Output window:</p> <ul style="list-style-type: none"> • It contains a UML ExpansionRegion (<i>ExpansionRegion1</i>) that 	

Topic	Detail	See also
	<p>is missing its child input ExpansionNode</p> <ul style="list-style-type: none"> • It contains an invalid self-generalization on <i>Class2</i> (UML elements cannot be self-generalized) • It contains an OCL violation for the anonymous Association (between <i>Class2</i> and <i>Object1</i>) • It contains a UML ExceptionHandler (<i>ExceptionHandler1</i>) that is missing its child input ObjectNode 	

How To:

To use Model Validation, follow the steps below:

Step	Action	See Also
1	Select the package, diagram or element either from the Project Browser or within an open diagram	
2	<p>Select the Validate Selected menu option</p> <p>Enterprise Architect performs the validation, and displays the results in the Output window (if the Output window does not automatically display, select the View System Output menu option)</p> <p>While performing the validation, Enterprise Architect also displays a progress window containing the Cancel Validation button, which enables you to cancel the validation process at any time</p> <p>Alternatively, select the Project Model Validation Cancel Validation menu option</p>	Output Window ^[127]

Notes:

- If you double-click on an error in the Output window, you select the diagram element that the error message refers to

Learn More:

- [UML rules](#)^[1690]
- [Configuring Model Validation](#)^[1689]

15.1.1 Configure Model Validation

Use the Model Validation Configuration dialog to enable and disable the rules that are run with the model validator. You can define additional rules in this dialog from any additional Add-Ins that might be installed besides Enterprise Architect.

Access: **Project | Model Validation | Configure**

Topics:

Topic	Detail	See also
Usage	<p>Click on the checkbox against each Validation Rule to apply in performing a model validation</p> <p>When you perform a validation, each violation listed on the Output window has a violation ID of the format <i>MVRxxnnnn</i>, where:</p> <ul style="list-style-type: none"> <i>MVR</i> stands for Model Validation Rule <i>xx</i> is a hexadecimal number corresponding to the position of the validation rule in the Model Validation Configuration dialog, thus indicating which rule is applied and violated <i>nnnn</i> is the number of the violation message <p>Therefore:</p> <ul style="list-style-type: none"> Messages with the ID <i>MVR01nnnn</i> indicate that the Element: Well-Formedness checkbox is selected and a violation of that rule has been detected Messages with the ID <i>MVR0Annnn</i> indicate that the Feature: OCL Conformance checkbox (10th in order on the dialog, or <i>Ath</i> in hexadecimal) is selected and a violation of that rule has been detected 	Model Validation ¹⁶⁸⁸

Notes:

- To disable UML syntax ("*The requested connection is not UML compliant*"), select the **Tools | Options | Diagram** option, and in the General panel deselect the **Strict UML Syntax** checkbox

- [Rules Reference](#) ¹⁶⁹⁰

15.1.2 Rules Reference

Topics:

Topic	Detail	See also
Validation Rules	<p>Model Validation works against a set of validation rules, arranged in the following groups:</p> <ul style="list-style-type: none"> (Element, Relationship, Feature, Diagram): Well-Formedness Checks whether or not an element, relationship, feature or diagram is well-formed; this group of rules includes checks such as whether the item is a valid UML item and whether a diagram contains valid elements within it Element: Composition Checks whether or not a UML element contains valid children, whether it contains the right number of valid children, and whether or not the element is missing any required children (Element, Relationship, Feature): Property Validity Checks whether or not the item has the correct UML properties defined, and whether the properties contain incorrect or conflicting values (Element, Relationship, Feature): Custom Properties Validates an item against any defined constraints in OCL 	Well-Formedness ¹⁶⁹¹ Element: Composition ¹⁶⁹¹ Property Validity ¹⁶⁹² OCL Conformance ¹⁶⁹²

15.1.2.1 Well-Formedness

This group of rules checks whether or not an element, relationship, feature or diagram is well-formed. The rules includes checks such as whether the item is a valid UML item and whether a diagram contains valid elements within it.

Reported violations:

Violation ID	Description	Information
MVR010001	«Element» is not a valid UML Element	The element is not a recognized UML 2.3 element
MVR050001	«Relationship» is not a valid UML Relationship	The relationship is not a recognized UML 2.3 relationship
MVR050002	«Relationship» is not legal for «Start Element» --> «End Element»	The relationship between the given start and end elements is not valid for those elements
MVR050003	«Parent Element»:isLeaf=true and cannot be generalized by «Child Element»	The Generalization relationship cannot exist between parent and child elements because the parent element is defined as a leaf element
MVR050004	«Child Element»:isRoot=true and cannot generalize «Parent Element»	The Generalization relationship cannot exist between parent and child elements because the child element is defined as a root element
MVR050005	«Element» cannot generalize self	The element cannot be self-generalized
MVR0B0001	Statechart violation: «extended information»	The State diagram contains a UML violation; see the extended information for more information about the detected violation

15.1.2.2 Element Composition

This group of rules checks whether or not a UML element contains valid children, whether it contains the right number of valid children, and whether or not the element is missing any required children.

Reported violations:

Error ID	Description	Information
MVR020001	«Element» is missing required child element «Child Element»	The element is missing a child element of type <i>Child Element</i>
MVR020002	Invalid UML package child	The element cannot be a direct package child and must be a child of another element (for example: Ports must be children of other elements, and not direct UML package members)
MVR020003	Invalid child «Child Element name» («Child Element Type»)	The child element is invalid on the tested parent element

15.1.2.3 Property Validity

This group checks whether or not an element, relationship or feature has the correct UML properties defined for it and whether they contain incorrect or conflicting values.

Reported violations:

Error ID	Description	Information
MVR030001	«Element»:«Property» property is undefined	The element property contains no value
MVR030002	«Element»:«Property» property has invalid value: "«Value»"	The element property contains an invalid value
MVR030003	«Element»:isLeaf=true and cannot be abstract	The element's <i>isLeaf</i> and <i>isAbstract</i> properties are both set to true , which is invalid
MVR060001	«Relationship»:«Property» property is undefined	The relationship property contains no value
MVR060002	«Relationship»:«Property» property has invalid value: "«Value»"	The relationship property contains an invalid value
MVR090001	Attribute/AssociationEnd mismatch, «Attribute»: «Mismatch description», ...	The given attribute has an <i>associationEnd</i> of the same name but they differ in the listed details

Learn More:

- [Properties Dialog](#)^[660] (Element)
- [Connector Properties](#)^[756]

15.1.2.4 OCL Conformance

This group validates an element, relationship or attribute against any defined constraints in the Object Constraint Language (OCL). OCL is used to describe expressions on UML models, and to express constraints free of side-effects. You can add OCL constraints to any element, relationship or attribute in Enterprise Architect.

Reported violations:

Error ID	Description	Information
MVR040001	OCL violation: «violated OCL»	The element violates the OCL constraint specified
MVR070001	OCL violation: «violated OCL»	The relationship violates the OCL constraint specified
MVR0A0001	OCL violation: «violated OCL»	The attribute violates the OCL constraint specified

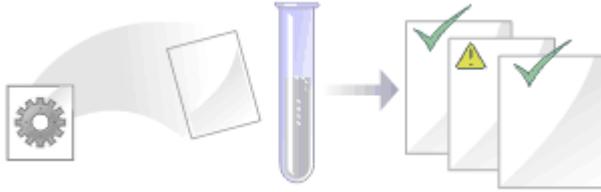

Topics:

Topic	Detail	See also
Define OCL Constraints for an Element	<p>You can add OCL constraints to an element using the Properties dialog (Element Properties); select the Constraints page, click on the Type drop-down arrow and select OCL</p> <p>To perform an OCL Validation, display the Model Validation Configuration dialog and select the Element: (OCL) Conformance checkbox; any OCL violations are recorded in the Model Validation tab of the Output window</p>	Model Validation Configuration Model Validation
Define OCL Constraints for a Relationship	<p>You can add OCL constraints to a relationship using the Properties dialog (right-click and select the <type> Properties context menu option); select the Constraints page, click on the Type drop-down arrow and select OCL</p> <p>To perform an OCL Validation, display the Model Validation Configuration dialog and select the Relationship: (OCL) Conformance checkbox; any OCL violations are recorded in the Model Validation tab of the Output window</p>	
Define OCL Constraints for an Attribute	<p>You can add OCL constraints to a feature using the Properties dialog (Element Attributes); select the Constraints tab, click on the Type drop-down arrow and select OCL</p> <p>To perform an OCL Validation, display the Model Validation Configuration dialog and select the Feature: (OCL) Conformance checkbox; any OCL violations are recorded in the Model Validation tab of the Output window</p>	

Notes:

- To have a valid OCL constraint, the syntax must be correctly formed; if the expression is not correct, Enterprise Architect displays a message stating that the OCL constraint is not valid

Basic Tasks	<p>Simple tasks that you might perform include:</p> <ul style="list-style-type: none"> • Open the Testing Workspace • Use the Test Details dialog 	The Testing Workspace ^[1695] The Test Details Dialog ^[1696]
Categories	<p>Typically, you create:</p> <ul style="list-style-type: none"> • Unit tests for things that are being built, such as Classes and components • Integration tests to test how components work together • System tests to ensure the system meets business requirements • Acceptance tests to test user satisfaction, and • Scenario tests to test the end-to-end suitability and functionality of the application 	Unit Tests ^[1696] Integration Testing ^[1698] System Testing ^[1699] Acceptance testing ^[1700] Scenario testing ^[1701]
Using Tests	<p>Other tasks that you might perform when working with tests include:</p> <ul style="list-style-type: none"> • Import a scenario as a test • Move or copy tests between test types • Import a test from other elements 	Import a Scenario as a Test ^[1703] Move or Copy Tests Between Test Types ^[1703]

Topic	Detail	See also
	<ul style="list-style-type: none"> • Import a responsibility or constraint as a test • Create a maintenance item from a test • Generate a Test Details report • Show test script compartments • Create test documentation 	Import a Test from Other Elements ^[1705] Import a Responsibility or Constraint as a Test ^[1706] Create a Maintenance Item from a Test ^[1707] Generate Test Details Report ^[1786] Show Test Script Compartments ^[1707] Create Test Documentation ^[1708]

Notes:

- Most of the tasks identified above relate to a tests for a single element
- You can make a set of tests available to a number of elements by performing the above tasks on a **Test Case** element and then associating that Test Case with each of the other elements; the Test Case element also helps to make tests more visible in diagrams, the Project Browser, windows and searches

Learn More:

- [Test Case](#)^[1673]

15.2.1 The Testing Workspace

The Testing window, or Workspace, provides a quick and convenient method of working with element tests. When you select an element in a diagram or in the Project Browser, if the Testing window is visible the lists of tests for that element are loaded ready for modification or addition.

Access: [View](#) | [More Element Tools](#) | [Testing](#) (Alt + 3)

Topics:

Topic	Detail	See also
Using the Testing Workspace	<p>The window has two formats - Item mode and List mode respectively</p> <p>To toggle between the modes, click on the Show/Hide Properties button in the window toolbar</p> <p>To add new items, click on the New icon in the window toolbar; in:</p> <ul style="list-style-type: none"> • Item mode, this clears the fields for new data • List mode, this displays the Test details dialog <p>By clicking on the Auto button in Item mode or on the Test details dialog, you can apply an automatic naming/numbering nomenclature that you have previously defined</p>	Test Dialog ^[1696] Use Auto Naming and Auto Counters ^[628] Unit testing ^[1696] Integration testing ^[1698] System testing ^[1699] Acceptance testing ^[1700]

	<p>There are five tabs along the base of the window; one for each of the following types of testing:</p> <ul style="list-style-type: none"> • Unit testing • Integration testing • System testing • Acceptance testing • Scenario testing <p>The asterisk on a tab indicates that the tab contains saved information; if there is no information for a type of test, or the information has not yet been saved, its tab has no asterisk</p> <p>The tabs toggle between Item mode and List mode independently</p>	<p>Scenario testing^[170]</p>

Notes:

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Tests** permission to add, update and delete test records
- The Testing window can be docked to the application workspace

Learn More:

- [Permission List](#)^[205]

15.2.2 The Test Details Dialog

The Test Details dialog opens to edit tests when the Testing window is in List mode.

Double-click on an existing test case or click on the **New** icon in the window toolbar. The Test Details dialog displays.

Access: **View | More Element Tools | Testing (Alt + 3)**

Notes:

- Add multiple test cases in one batch using the **New** and **Apply** buttons
- You can format the text in the Description, Input, Acceptance Criteria and Results tabs using the Notes toolbar at the top of the field; this text is also reflected in the Notes window, but cannot be edited there
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Tests** permission to add, update and delete test records

Learn More:

- [Notes Toolbar](#)^[77]

15.2.3 Unit Testing

Use Unit Testing to test Classes, Components and other elements as programmers build them.

Access: **View | More Element Tools | Testing > Unit**

The Unit testing tab displays in the Testing window by default.

If any **Unit tests** exist, the first Test item for the element is shown in the Testing window in Item mode, and all items are listed either in the panel to the left of the window, or in the window in List mode.

Reference:

Notes:

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Tests** permission to add, update and delete test records

15.2.8 Move or Copy Tests Between Categories

When you define a test on the Unit, Integration, System, Acceptance or Scenario tab of the Testing window, you might decide that the test either is better suited to another category of tests, or forms a good template for tests in other categories. Enterprise Architect enables you to move or copy tests between categories.

How To:

To move or copy a test, follow the steps below

Step	Action	See Also
1	Open either: <ul style="list-style-type: none"> The Testing window, and the tab that contains the test you want to move or copy The <i>Testing</i> folder of the Element Browser window 	Element Browser ^[68]
2	Right-click on the required test item in the list The item context menu displays	
3	Click on the appropriate option - Move to or Copy to A list of test categories displays	
4	Click on the test category to which to move or copy the test A confirmatory prompt displays	
5	Click on the Yes button to confirm the move or copy	
6	Click on the target tab of the Testing window to ensure that the test has been added, and make any required changes	

Notes:

- If you move or copy a test into the Scenario category, some unassociated data could be lost

15.2.9 Import Scenario as Test

You can import a scenario from a Use Case or other element, or from all elements in a package, into the Testing window Scenario tab. This avoids having to duplicate the scenario information manually.

The scenario description is copied to the Scenario Test Description tab in the Testing window. If a scenario contains a Structured Specification, its **Action** steps are also copied to the Description tab under the heading **Structured Specification**.

How To:

To import a scenario from a single element, follow the steps below:

Step	Action	See Also
1	Open a diagram or the Project Browser and select the element into which to import the scenario	

Step	Action	See Also
2	Open either: <ul style="list-style-type: none"> The Testing window and the Scenario tab The <i>Testing</i> folder of the Element Browser window 	Element Browser ^[687]
3	Right-click on the list of tests to display the context menu, and select the Import element scenario(s) menu option The Import Scenario dialog displays	
4	You can import scenarios from any element in the model by clicking on the Select element drop-down arrow and selecting the required element Select the scenarios to import from the Select items to import list	
5	Click on the OK button to import the selected scenario(s)	

To import scenarios from all elements in a package, follow the steps below:

Step	Action	See Also
1	Open a diagram or the Project Browser and select the parent package element or an element within the package	
2	Open either: <ul style="list-style-type: none"> The Testing window and the Scenario tab The <i>Testing</i> folder of the Element Browser window 	Element Browser ^[687]
3	Right-click on the list of tests and select the Import Package Scenario(s) context menu option The Import Scenario dialog displays This version of the Import Scenario dialog lists all scenarios against all elements in the package; it does not enable you to select a specific element, but does enable you to filter the list of scenarios to those from specific types of element	
4	In the Limit selection to these Object Types only field, type a comma-separated list of the object types for which to show scenarios Click on the Refresh button	
5	Click on the OK button to import the scenarios from each element as test scenarios for that element	

Reference:

The Import Scenario dialog has the following additional options:

Field	Usage	See also
Show related elements only	Filter selection to apply only to related elements	
Limit selection to	Indicates specific element types, separated by commas, to filter for	

Field	Usage	See also
these Object Types only	only those element types	
Refresh	Refresh the list of available scenarios	

Notes:

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Tests** permission to add, update and delete test records

15.2.10 Import Test From Other Elements

You can import any test from a Use Case or other element into the Testing window. This avoids having to duplicate the test information manually.

How To:

To import a test, follow the steps below:

Step	Action	See Also
1	Open a diagram or the Project Browser and select the element into which to import the tests	
2	Open either: <ul style="list-style-type: none"> The Testing window, or The <i>Testing</i> folder of the Element Browser window 	Element Browser
3	Right-click on the list of tests and select the Import Tests from Other Element context menu option The Import Element Tests dialog displays	
4	You can import tests from any element in the model by clicking on the Select element drop-down arrow and selecting the required element Select the test to import from the Select items to import list	
5	Click on the OK button to import the selected test(s)	

Reference:

The Import Element Tests dialog has the following additional options:

Option	Action	See also
Show related elements only	Filter selection to apply only to related elements	
Limit Selection to these Object Types only	Indicates specific element types, separated by commas, to filter for only those element types	

Option	Action	See also
Refresh	Refresh available options	

Notes:

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Tests** permission to add, update and delete test records

15.2.11 Import Responsibility or Constraint as Test

In the same way as you can import a scenario from an element as a test, you can also import an internal requirement (responsibility) or internal constraint as a test.

How To:

To import a requirement or constraint as a test, follow the steps below:

Step	Action	See Also
1	Open a diagram or the Project Browser and select the element into which to import the responsibility or constraint	
2	Open either: <ul style="list-style-type: none"> The Testing window and the tab into which to import the test The <i>Testing</i> folder of the Element Browser window 	Element Browser [687]
3	Right-click on the list of tests to display the context menu (if in the Element Browser, click on a test of the appropriate type)	
4	Click on the appropriate option, either: <ul style="list-style-type: none"> Import element constraint(s) Import element requirement(s) <p>The Import Constraint or Import Requirements dialog displays (the two dialogs are identical)</p> <p>The dialog lists all of the internal requirements or constraints in the selected element</p>	
5	Select one or more of the items to import as tests, and click on the OK button	
	Each item is added to the list of tests in the Testing window, as a standard, 'Not Run' test	
6	Edit the items to complete their definition as tests	

Notes:

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Tests** permission to add, update and delete test records

15.2.12 Create Maintenance Item From Test

If an element fails a test, one likely consequence is that a Defect (Issue) item has to be raised in model maintenance to correct the problem. You can generate this Defect item directly from the test that failed.

How To:

To create a Maintenance item from a test, follow the steps below:

Step	Action	See Also
1	In the Testing window, or the <i>Testing</i> folder of the Element Browser window, right-click on the test item from which to generate the Maintenance item	
2	On the context menu, select the Create a Maintenance Defect from this test menu option A message box displays	
3	Click on the OK button to clear the message	
4	Open the Maintenance window and select the Defects tab The window displays a defect item having the same name as the test, and the test Description , Input , Acceptance Criteria and Results texts are displayed in the defect Description tab	
5	Update the defect item as required	Maintenance Item Properties 

Notes:

- You can create Maintenance Defect items from several Test items at once; press and hold (**Shift**) as you select the Test items, and then right-click and proceed as above - each selected Test item then generates a Defect item

15.2.13 Show Test Script Compartments

Any element that is capable of displaying a compartment can be used to show test scripts in a diagram. To make use of the feature the element must have an attached test.

How To:

To show the Test Script compartment on an element in a diagram, follow the steps below:

Step	Action	See Also
1	Open a diagram containing the element with the attached test items	
2	Double-click on the diagram background to display the Diagram Properties dialog Click on the Elements tab	
3	In the Show Compartments panel, select the Testing checkbox	
4	Click on the OK button to save the setting The tests now appear as an item in the test scripts compartment of the diagram	

Step	Action	See Also
	element	

Example:

CCBookClientPanel		JPanel
~	bookpanel: CCBookPanel = new CCBookPanel()	
~	lbl_Price: JLabel = new JLabel("Price")	
+	CCBookClientPanel()	
+	GetBook() : CBook	
-	getUI() : void	
-	jbInit() : void	
+	SetBook(CBook) : void	
-	setUI() : void	
test scripts		
Acceptance: : (Pass) User Satisfaction		

15.2.14 Test Documentation

Enterprise Architect enables you to output the test scripts and results you have entered against elements in the model, in Rich Text format. For more information on entering test scripts and details see the previous sections of the Testing topic.

Access: **Project Browser Package context menu | Documentation | Testing Report**

Notes:

- You can also access the Generate Test Documentation dialog by selecting the **Project | Documentation | Testing Report** menu option
- The Generate Test Documentation dialog enables you to set up your report; you can configure which tests to include or exclude in the report, whether to include child packages and what file to output to

- [Testing](#)^[1694]

Part

16 Maintenance

This section discusses the Enterprise Architect facilities for:

- Creating and monitoring maintenance items on project elements
- Creating and monitoring change and issue items on the project

Learn More:

- [Maintenance Items](#) [1713]
- [Changes and Defects](#) [1719]

16.1 Maintenance Diagram

A Maintenance diagram is a custom diagram used to describe change requests and issue items within a system model.

Change, Task and Issue elements can be linked back to other model elements in the system to illustrate how they must be modified, fixed or updated.

Maintenance models provide extensions to the UML model and enable change management of change items, and of the model elements that require the changes to be made to them.

Example Diagram: [Example Maintenance Diagram](#) 

Tools:

Select Maintenance diagram elements and connectors from the Maintenance pages of the Toolbox.

Maintenance Diagram Elements	Maintenance Diagram Connectors
 Package	 Aggregate
 Issue	
 Change	
 Test Case	
 Entity	

16.1.1 Example Maintenance Diagram

An example Maintenance diagram is shown below.

Changes

EA supports custom Elements of type 'Change'. These can be linked to other elements in the repository or used as a separate lists of any changes proposed for the model.

Below are a set of Change elements for the shopping basket with test definitions listed against them. They are ready for checking once they are confirmed as corrected.

The color markings reflect the Status of the element.

16.2 Maintenance

Topics:

Topic	Detail	See also
Maintenance Items	<p><i>Maintenance</i> items are defects, changes, issues and tasks. They all apply to individual model elements and can be used to record and capture problems, changes, issues and tasks as they arise, and document the solution and associated details. They are defined as follows:</p> <ul style="list-style-type: none"> • A defect can be considered as a failure to meet a requirement for the current model element • A change can be considered as a change in requirement for the current model element • An issue records a risk factor that might affect the project being recorded for the current model element • A task is a means of recording work in progress and work outstanding for the current model element <p>Note that each of these maintenance items applies at the model element level. For <i>changes</i>, <i>defects</i> and <i>issues</i> that apply to the whole system, see the Changes and Defects topic; for tasks that apply to the whole system, see the Project Tasks topic.</p>	<p>Changes and Defects ^[1713]</p> <p>Project Tasks ^[356]</p>
Creating and Editing Maintenance Items	<p>The following topics explain how to create and edit Maintenance items:</p> <ul style="list-style-type: none"> • The Maintenance Workspace - describes the Maintenance window • Maintenance Item Properties - describes how to complete the Maintenance window tabs for the various maintenance items • Move or Copy Maintenance Items - describes how to move items between maintenance categories or generate items from an item in a different category • Create Elements From Maintenance Items - describes how to generate elements from maintenance items • Show Maintenance Script in Diagram - describes how to display maintenance items in elements on diagrams • Insert Maintenance Feature - describes how to add a maintenance item directly to an element via in-place editing 	<p>The Maintenance Workspace ^[1713]</p> <p>Maintenance Item Properties ^[1715]</p> <p>Move or Copy Maintenance Items ^[1716]</p> <p>Create Elements From Maintenance Items ^[1717]</p> <p>Insert Maintenance Feature ^[727]</p>

16.2.1 The Maintenance Workspace

Enterprise Architect makes it easy to record and capture problems and issues as they arise, and document the solution and associated details. The **Maintenance** window provides a quick method of viewing and modifying the changes, issues defects and 'to do' items associated with a particular model element. You can include the maintenance items in the main RTF documentation and HTML produced by Enterprise

Architect. The **RTF Setup** dialog has checkboxes to show or hide element maintenance items.

Access: **View | Other Element Tools | Maintenance (Shortcut: Alt+4)**

Topics:

Topic	Detail	See also
Usage	<p>You can also use the Element Browser window to select and display specific items on the Maintenance window. Click on the  icon in the Maintenance window toolbar to display the Element Browser, open the Maintenance folder and select the required item. In the folder, the 'page' icon contains a C for Change items, D for Defect items, T for Task items, or I for Issue items.</p> <p>The window has two formats. In List mode a detailed list is provided showing several columns of information. In Item mode this list is cut down and instead an editor for the selected item is provided.</p> <p>To toggle between the modes, click on the Show/Hide Properties button in the window toolbar. Item mode displays a single item with others of the same type listed in the left-hand panel. You can also either switch to List mode or select another item from the Element Browser window. List mode displays all items of one type in the selected element; it does not, however, display as much detail on an item as Item mode does.</p> <p>Using the toolbar, you can add or delete items and show or hide the Properties window to enable you to edit each item in the list. Click on the New icon in the window toolbar to add new items. In Item mode, this clears the fields for new data. In List mode, this displays the <item type> details for <element type> <element name> dialog. By clicking on the Auto button in Item mode or on the details dialog, you can apply an automatic naming/numbering nomenclature that you have previously defined.</p> <p>An asterisk on a tab (as for the Defects tab, above) indicates that the tab contains saved information. If the tab has no information or the information has not yet been saved, there is no asterisk, as shown for the Tasks tab.</p> <p>You can also display the maintenance items in a compartment of each appropriate element in a diagram.</p>	<p>Element Browser^[687]</p> <p>Maintenance Item Properties^[1715]</p> <p>Use Auto naming and Auto counters^[628]</p> <p>Show Maintenance Scripts in Diagrams^[1717]</p>

- [Maintenance](#)^[1715]

16.2.2 Maintenance Item Properties

Access: [View | More Element Tools | Maintenance](#)

To create, edit or delete maintenance items, follow the steps below

How To:

Step	Action	See Also
1.	Select the View More Element Tools Maintenance menu option. The Maintenance window displays.	
2.	Open a diagram or the Project Browser and select an element. In Item mode, the oldest maintenance item of each type for that element is shown in the Maintenance window, on the appropriate tab. The other items are listed either in the left hand panel or in List mode.	
3.	Click on the Browse Element icon in the window toolbar. The Element Browser window displays.	
4.	To: <ul style="list-style-type: none"> • Add a new item, select the appropriate tab, click on the New icon in the Maintenance window toolbar and complete the fields as described in the table below • Modify an existing item, select the item from the left-hand list panel or from the <i>Maintenance</i> folder of the Element Browser window and edit the fields as described in the table below • Delete an existing item, select the item from the left-hand list panel or the Maintenance folder of the Element Browser window and click on the Delete icon in the Maintenance window toolbar 	
5.	Click on the Save button in the window toolbar.	

Complete or edit the following fields on the **Maintenance** window

Field	Usage	See Also
Name	Type the name or a short description of the defect.	
Reported by	Select the name of the person who reported the defect.	
Reported	Select the date on which the defect was reported.	
Status	Select the defect status, such as New or Complete.	
Resolved by	Select the name of the person who fixed the defect.	
Resolved	Select the date on which the defect was resolved.	
Priority	Select the priority assigned to resolving the defect.	
Version	Type the version number associated with this fix.	
Description	Type a longer description of the defect. You can format the text using the Notes toolbar at the top of the field. This text is also reflected in the Notes window, but cannot be edited there.	Notes Toolbar ¹⁷⁷⁰

Field	Usage	See Also
History	Enter any notes or references to previous occurrences of this defect. You can format the text using the Notes toolbar at the top of the field. This text is also reflected in the Notes window, but cannot be edited there.	

Notes:

- For information on element-level Defects, Issues, Changes and Tasks, see the *Maintenance* topic. For information on the **Maintenance** window, see the *Maintenance Workspace* topic
- This table describes the fields of the **Defects** tab of the **Maintenance** window. The **Changes**, **Issues** and **Tasks** tabs differ only in minor details

16.2.3 Move or Copy Maintenance Items

When you define an item on the **Defects**, **Changes**, **Issues** or **Tasks** tab of the **Maintenance** window, you might decide that the item either is better suited to another Maintenance category, or forms a good template for items in other categories. Enterprise Architect enables you to move or copy items between categories.

To move or copy a maintenance item, follow the steps below

How To:

Step	Action	See Also
1.	Open the Maintenance window and select the tab that contains the item you want to move or copy.	Maintenance Workspace ^[1713]
2.	Right-click on the required maintenance item. The item context menu displays.	
3.	Click on the appropriate option - Move to or Copy to . A list of maintenance categories displays.	
4.	Click on the category to which to move or copy the item. A confirmatory prompt displays.	
5.	Click on the Yes button to confirm the move or copy.	
6.	Click on the target tab to ensure that the item has been added, and make any required changes.	Maintenance Item Properties ^[1715]

16.2.4 Create Elements From Maintenance Item

A maintenance item identifies a defect, change, issue or task concerning an element. The maintenance item could itself be represented by an element if it has wider implications for the project or identifies - for example - an actor, activity or action that requires further definition.

You can create one or more elements from any maintenance item, using the **Maintenance** window. The new element is connected to the maintenance item's parent element by a Dependency connector. The item itself remains unchanged as a characteristic of its parent element.

To create an element from a maintenance item, follow the steps below:

How To:

Step	Action	See Also
1.	Open the Maintenance window and select the tab that contains the item you want to create the element from.	Maintenance Workspace ^[1713]
2.	Right-click on the required maintenance item. The item context menu displays. select the Create as new Element context menu option. The New Element dialog displays.	Add Elements Directly To a Package ^[627]
3.	In the Name field, type a name for the new element.	
4.	In the Type field, click on the drop-down arrow and select the required element type. For example , you might create an Issue element for a Defect or Issue maintenance item, a Change element for a Change item, or an Action for a Task item. You can, however, create a wide range of other element types should any of these be appropriate, and use the Select Group button to select a profile, MDG Technology or Add-In to create an element specific to that element group.	
5.	If necessary, in the Stereotype field click on the drop-down arrow and select a stereotype to apply to the new element.	
6.	If you want to immediately define the properties of the element, select the Open Properties Dialog on Creation checkbox.	
7.	If you are adding multiple elements in one session, deselect the Close dialog on OK checkbox.	
8.	If you want to add the element to the currently-open diagram, select the Add to Current Diagram checkbox.	
9.	Click on the OK button to create the element.	

The element is added to the **Project Browser** and - if requested - to the current diagram.

16.2.5 Show Maintenance Script in Diagram

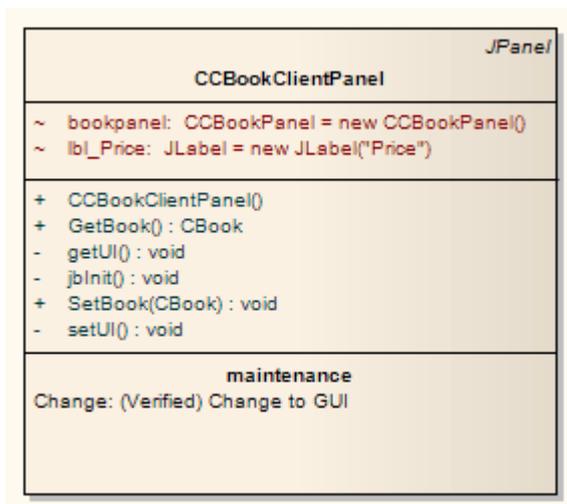

Any element that is capable of displaying a compartment can show **maintenance scripts** in a diagram. To make use of the feature the element must have an attached maintenance item.

To show maintenance compartments in a diagram, follow the steps below

How To:

Step	Action	See Also
1.	Open a diagram containing the element with the attached maintenance items.	
2.	Double-click on the diagram background to display the Diagram Properties dialog. Click on the Elements tab.	
3.	In the Show Compartments panel, select the Maintenance checkbox.	
4.	Click on the OK button to save the setting.	

The maintenance Items now appear as items in the maintenance scripts compartment of the diagram element.

16.3 Changes and Defects

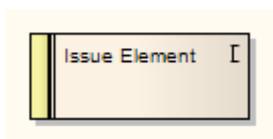

Topics:

Topic	Detail	See also
Change and Defect Elements	<p>Changes and Defects are structured comments that can be used in managing change in a project</p> <p>A Defect element (also known as an Issue element) corresponds to a failure to match the requirements for the current system</p> <p>A Change element corresponds to a change in requirements for the current system</p>	Changes ^[1721] Defects ^[1719]
Using Structured Comments	<p>You can track changes and defects (issues) in an Enterprise Architect model</p> <p>Change and Defect elements can be created in UML diagrams and connected using Realization, Dependency, Aggregation and other relationships to show what model element each affects and how each is resolved</p> <p>You can edit the element properties, and assign people (as Actor elements) to changes and defects</p>	Element Properties ^[1722] Assign People to Defects or Changes ^[1722]

16.3.1 Defects (Issues)

A *Defect* (or *Issue*) element is a structured comment that contains information about defects and issues that relate to the system or model. This corresponds in some sense to a failure to meet defined requirements for the current system. An Issue element looks the same as a Requirement element:

Enterprise Architect enables you to generate and handle issues in much the same way as you can handle and **color code** Requirements. See the **Requirements** topic for more information.

You can link Issues using *Realize* connectors to model elements that are responsible for the defect. You can even structure a hierarchy of Issues using aggregation.

To add an Issue to the model using the Toolbox, follow the steps below

How To:

Step	Action	See Also
1.	Open a Custom diagram.	
2.	From the Custom pages or Common page of the Toolbox, drag the Issue icon onto the diagram.	Custom Group ^[562] Common Group ^[552]
3.	Enter the details as required.	

To add an Issue to the model using the Insert New Element dialog, follow the steps below

How To:

Step	Action	See Also
1.	Right-click on a package in the Project Browser .	
2.	Select the Insert New Element context menu option. The New Element dialog displays.	
3.	In the Type field, click on the drop-down arrow and select Issue .	
4.	In the Name field, type a name for the element.	
5.	Click on the OK button.	

Notes:

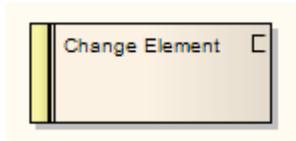

- Issue elements can be created with or without an identifying I in the top right corner of the element. To toggle the display of this letter, select or deselect the **Show stereotype icon for requirements** checkbox on the **Options** dialog, **Objects** page

Learn More:

- [Color Codes](#)^[1159]
- [Requirements](#)^[1152]
- [Objects](#)^[432]

16.3.2 Changes

A *Change* element is a structured comment that contains information about requested changes to the system/model. This corresponds in some sense to a change in requirements for the current system. A Change element looks the same as a Requirement element:

Enterprise Architect enables you to generate and handle Changes in much the same way as you can handle and [color code](#) ^[1159] Requirements. See the [Requirements](#) ^[1152] topic for more information.

You can connect *Changes* using *Realization* connectors to model elements that implement the Change, and you can structure a hierarchy of changes using Aggregation.

Change elements can be created with or without an identifying **C** in the top right corner of the element. To toggle the display of this letter, select or deselect the **Show stereotype icon for requirements** checkbox on the Options dialog, Objects page.

How To:

To add a Change to the model using the Toolbox, follow the steps below

Step	Action	See Also
1	Open a Custom diagram.	
2	From the Custom pages or Common page of the Toolbox, drag the Change icon onto the diagram.	Custom Group ^[562] Common Group ^[552]
3	Enter the details as required.	

To add a Change to the model using the Insert New Element dialog, follow the steps below

Step	Action	See Also
1	Right-click on a package in the Project Browser .	
2	Select the Insert New Element context menu option. The New Element dialog displays.	
3	In the Type field, click on the drop-down arrow and select Change .	
4	In the Name field, type a name for the element.	
5	Click on the OK button.	

Notes:

- Change elements can be created with or without an identifying **C** in the top right corner of the element. To toggle the display of this letter, select or deselect the **Show stereotype icon for requirements**

checkbox on the **Options** dialog, **Objects** page.

Learn More:

- [Color Codes](#) ^[1159]
- [Requirements](#) ^[1152]
- [Objects](#) ^[432]

16.3.3 Element Properties

The **Properties** dialog for Changes and Issues is similar to that used by Requirements. It has a **Properties** tab containing the name of the Issue and relevant management details (such as owner and dates). You can also associate files with the issue and add Tagged Values.

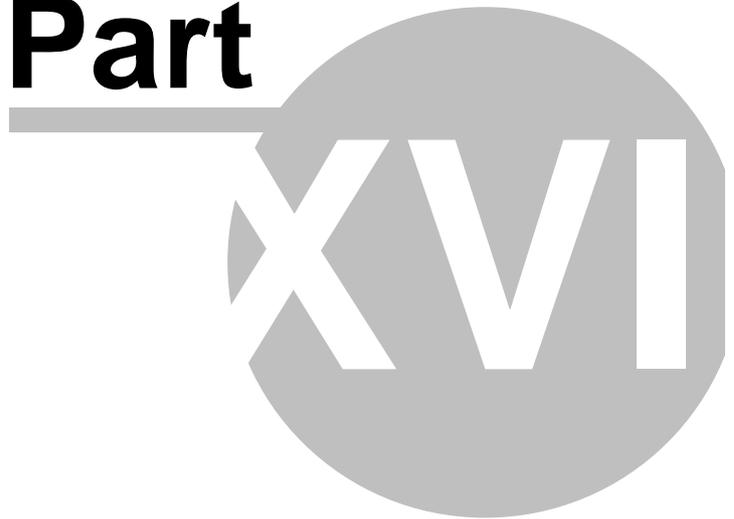

Learn More:

- [Associate Files](#) ^[687]
- [Add Tagged Values](#) ^[763]

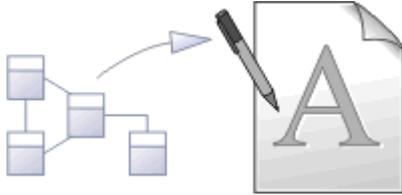

16.3.4 Assign People to Defects or Changes

As an example of how you might use the **Relationship Matrix** to monitor issues or changes, the screen below illustrates staff (actors) being linked through *Realization* connectors to *Issues*. Each highlighted square indicates a responsibility of a staff member to work on or correct a named issue. This same approach can be used for any mix of model elements.

Part

17 Reporting

Model documentation is essential to realizing the full benefit of Enterprise Architect. Enterprise Architect provides a powerful mechanism for generating high quality, customized documentation directly from your model, in either RTF or HTML format.

Topics:

Topic	Detail	See also
Specifying Content	<p>There are many ways to specify the Enterprise Architect content being documented; you can:</p> <ul style="list-style-type: none"> • Document a package and/or its child packages by manually highlighting the package and selecting a documentation control • Specify embedded packages for exclusion if child packages are recursively documented • Link a package to an RTF document template to simplify generating consistent types of documentation (e.g. Use Case Reports) using the Documents feature • Select, group and order packages together in a different manner from the Project Browser by creating 'Virtual Documents', either linked through a master document with headers, footers and contents list, or as separate individual documents 	<p>Exclude Package From Report^[1731]</p> <p>Save As Document^[1793]</p> <p>Virtual Documents^[1774]</p>
RTF Documentation	<p>Rich text reports are documents produced by Enterprise Architect in Rich Text Format (RTF), which can be modified directly with RTF Style templates to alter the look and feel of generated output</p> <p>Using MS Word you can further enhance the separate RTF documents output from the model by connecting and interweaving them into a linked master document with headers, footers and contents list</p> <p>Enterprise Architect has a fully-featured RTF Document Generator that features:</p> <ul style="list-style-type: none"> • Powerful WYSIWYG RTF style template editor support • An easy-to-use document generator • An embedded RTF viewer that enables you to view RTF documents generated by Enterprise Architect within Enterprise Architect 	<p>RTF Documents^[1726]</p> <p>Use MS Word^[1795]</p>

- [Custom Language Settings](#)^[1794]
- [Include or Exclude a Package from Report](#)^[1731]
- [List of Available Permissions](#)^[205]

17.1.1 Generate RTF Documents

Creating a Rich Text Format (RTF) document is a simple and flexible process. An RTF document is based on a package or an element in your project (more usually a package). To produce a document, you must select the package or element to report on in the Project Browser, Package Browser, Diagram List or Model Search.

You should also set the diagram properties to determine how the diagrams in the package are set out in the RTF document. When you have prepared and selected your package, use the context menu to open the Generate RTF Documentation dialog and configure the details of your document. The next topic guides you through creating a rich text report.

Topics:

Topic	Detail	See also
Open the Generate RTF Documentation Dialog	<p>Use one of the following methods:</p> <ul style="list-style-type: none"> • Select the Project Documentation Rich Text Format (RTF) Report menu option • In the Project Browser, right-click on the required package and, on the context menu, select the Documentation Rich Text Format (RTF) Report menu option • In the Project Browser or a diagram, click on the required package or element and press (F8) • In a diagram, click on a specific element and select the Element Advanced Rich Text Format (RTF) Report menu option • In the Diagram List, Package Browser or Model Search, select one or more items, right-click and, from the context menu, select either the RTF Report Generate report for each selected object option or the RTF Report Generate one report for all selected option 	Generate RTF Documentation Dialog ^[1732]
Generate RTF Report From Package Browser or Model Search	<p>When you select to create an RTF Report from the Diagram List, Package Browser or Model Search tools, you can generate an element-level report rather than a package-level report, and you have additional flexibility in selecting:</p> <ul style="list-style-type: none"> • The type of element to report on • The specific elements to report on, together or separately, whether in the same package or not <p>For example, you might want to find all elements with test cases, with the intention of reporting on some or possibly all such elements; with the Diagram List or Package Browser, you would identify these elements yourself within the list of all elements in a selected package, but with the Model Search you could specifically identify the elements across a section of the model or across the whole model, as required</p> <p>The search filtering could be for specific test cases; however, the results are by element so if there are test cases outside the range in any element that has a filtered test, these elements are listed as well</p> <p>Having generated the list of elements, you can select individual elements, blocks of elements, or all elements and then (as above) use the context menu to generate a report on all of the elements, or separate reports on each element</p>	Diagram List ^[462] Package Browser ^[456] Model Search ^[475]

How To:

To generate and view an example RTF report right now, follow the steps below:

Ste	Action	See Also

p		
1	Open the <i>EASample</i> project	
2	Open the <i>QA Model</i> package and right-click on the Testing package	
3	Select the Documentation Rich Text Format (RTF) Report context menu option The Generate RTF Documentation dialog displays	
4	In the Output to file field, select a convenient file location in which to hold the generated report	
5	In the Use Template field, click on the drop-down arrow and select (basic template)	
6	Click on the Generate button	
7	When the report has been generated, click on the View button	

Notes:

- Reports can be configured to include all packages within a parent package, or just the top level

Learn More:

- [Diagram Options](#)  ^[1729]

17.1.1.1 Diagram Options

This topic refers to options on the Diagram page of the Diagram Properties dialog, which are used when generating RTF reports for a particular diagram.

Access: **Diagram background context menu | Properties > Diagram page**

Topics:

Topic	Detail	See also
Exclude Image from RTF Documents	Select this checkbox to exclude the image of the current diagram from any RTF reports	
Document Each Contained Element in RTF	Select this checkbox to ensure the RTF report generator includes details of elements that belong in other - external - packages but that are linked into this diagram within the package being reported on; the report includes external elements for each diagram on which you have selected the checkbox On the Generate RTF Documentation dialog, the Include all Diagram Elements in Report checkbox defaults to selected, to include external elements for <i>every</i> diagram covered by the report; therefore, to include external elements only for specific diagrams, deselect this checkbox In either case, you must enable the <i>Package.Diagram.Element</i> and <i>Package.Element</i> sections in your (customized) document generation templates in order to include this external element	Generate RTF Documentation Dialog  ^[1732] Report Elements From External Packages  ^[1730]

Topic	Detail	See also
	information in the report	
Divide Diagram Into Multiple Sections	Select this checkbox to divide each large diagram into separate pages in the RTF document This option is only effective when the Scaled Printing option is set to None on the Print Advanced dialog	Scaled Printing Option ^[602]
Rotate Images	Select this checkbox to rotate each diagram image by 90 degrees in the RTF document; this is only valid for bitmap (.bmp) images	

Learn More:

- [Diagram Tab](#)^[571]

17.1.1.2 Report Elements From External Packages

Elements can be re-used in different diagrams across a model; this can often mean that a diagram contains elements that are held in packages other than the diagram's parent package.

When generating an RTF report on a package, you might want to include elements that are not held in that package, but that are referenced in diagrams within the package. To do this you must:

- Select the appropriate diagram options on the Generate RTF Documentation dialog and/or the Diagram page of the diagram Properties dialog
- Enable the appropriate template sections in the report template, as described in this topic

Access: [Project Browser package context menu | Documentation | Rich Text Format \(RTF\) Report \(F8\)](#)

How To:

To enable the template sections, follow the steps below:

Step	Action	See also
1	Select the Rich Text Format (RTF) Report menu option The Generate RTF Documentation dialog displays	
2	In the Use Template field, click on the drop-down arrow and select the appropriate customized template (not a system-provided one)	
3	Click on the Edit Template button to display the RTF Template Editor	
4	In the Sections panel on the left-hand side of the editor window, select the Package::Element checkbox Selecting the checkbox adds the following set of sections to the Content panel of the template:	

Step	Action	See also
	<pre> package > [right-click-to-insert-Package-field(s)] element > [right-click-to-insert-Element-field(s)] child elements > < child elements < element < package </pre>	
5	<p>Delete the <i>[right-click-to-insert-Element-field(s)]</i> text to leave a blank area</p> <p>Right-click and select the Insert Field Name context menu option, this inserts an Element.Name field in the template</p>	
6	<p>In the Sections panel, select the Package::Diagram::Element checkbox</p> <p>Selecting the checkbox adds the following set of sections to the Content panel of the template:</p> <pre> package->¶ [right-click-to-insert-Package-field(s)]¶ diagram->¶ [right-click-to-insert-Diagram-field(s)]¶ element->¶ [right-click-to-insert-Element-field(s)]¶ <-element¶ <-diagram¶ <-package¶ </pre>	
7	<p>To report on the linked elements in:</p> <ul style="list-style-type: none"> the same style as defined in the Package::Elements section, delete the <i>[right-click-to-insert-Element-field(s)]</i> text to leave a blank area a different style to the elements within the selected package, set up the style as appropriate <p>If using the Legacy RTF generator, the <i>Element</i> checkbox is automatically checked in your customized template, when you select the Document each contained element in RTF checkbox</p> <p>Package::Diagram::Element, if left blank, replicates the format of Package::Element including sub-element sections (for example, Package::Element::Scenario); Package::Diagram::Element does not have an option to add these sections</p>

- [Diagram Options](#) ^[1729]
- [Learning Center](#) > Reporting | RTF Templates | Reporting Elements from External Packages

17.1.1.3 Exclude Package from Report

You can exclude a particular package from any RTF or HTML report by marking it for exclusion.

Access: [Project Browser package context menu](#) | [Documentation](#) | [Generated Report Options](#)

How To:

To mark a package for exclusion from reporting, follow the steps below:

Step	Action	See Also
1	Select the Generated Report Options menu option The Generated Report Options dialog displays	
2	Select the Exclude Package from Generated Reports radio button	
3	Click on the OK button	

Notes:

- By default, packages are included in any generated reports
- When you exclude a package from reports, all of the selected package's subpackages are also excluded

17.1.1.4 Generate RTF Documentation Dialog

The Generate RTF Documentation dialog enables you to set the exact contents and look and feel of your report.

Each tab of the dialog offers a number of RTF document generation options, as described in the following sections:

- Generate Tab (see below)
- RTF Templates
- Document Options
- Advanced Options
- Element Filters
- Other Filters
- Project Constants
- Word Substitution
- Language Substitution (Codepage)

When you have worked through these tabs and set the options you require, return to the Generate tab and click on the **Generate** button to produce your report.

Reference:

Option	Action	See also
Model Document	Confirm the name of the element selected from the Project Browser, Diagram List or Model Search	Virtual Document ^[1774]
Root Element Root Package	If this is the specially-created model document element for a Virtual Document, the field is Model Document Otherwise, this field identifies the selected element of the hierarchy to be reported on; that is, the Root Element or Root Package	
Output to File	Type or select the location and filename for the generated documentation The (...) (Browse) button enables you to navigate to the location	

Option	Action	See also
Use Template	<p>Type or select the name of the RTF template to apply to document generation</p> <p>You can select either a standard template (enclosed in parentheses) or a user-generated template</p> <p>The standard templates include the following:</p> <ul style="list-style-type: none"> • (basic template) • (diagrams template) • (maintenance template) • (requirements template) 	
Use Language Substitutions	<p>Switch custom language word substitutions on</p> <p>Deselect to switch custom language word substitutions off</p>	Word substitutions 1773
View Document On Completion	<p>Open the document as soon as it has been generated</p>	
Use Internal Viewer	<p>Enable the View button to launch the generated RTF Documentation in the Enterprise Architect internal viewer</p> <p>Deselect to enable the View button to launch the generated RTF Documentation in the MS Windows default RTF file viewer</p>	Document options 1767
Include all Diagram Elements in Report	<p>Include elements in the report from external packages that are referenced from a diagram, for every diagram covered by the report; this defaults to selected</p> <p>The <i>Package.Diagram.Element</i> and <i>Package.Element</i> checkboxes must be selected in the current template</p> <p>If external elements are to be included only for specific diagrams, deselect this checkbox and - only for the diagrams for which you want to include external elements in the report - for each diagram select the Document each contained element in RTF checkbox in the diagram properties</p> <p>When both options are deselected, or when neither of the <i>Package.Diagram.Element</i> or <i>Package.Element</i> checkboxes are selected in the template, only elements in the current package are documented</p>	Diagram properties 1729
Optimize for Open Office	<p>Generate reports where diagrams are adjusted for clean rendering in Oracle Open Office</p> <p>The option also overwrites the value fields defined in a document section with the actual value text.; if you open a generated report in Word, you can format the text but you cannot display the original field code</p> <p>If the checkbox is <i>deselected</i>, diagrams displayed in Open Office are less distinct - value fields remain and are populated with the appropriate values; when you display a generated report in Word, you can right-click on the field and toggle between the value text and the field code</p> <p>If you use Open Office as your text editor, you must select this checkbox to show the field values; Open Office defaults to showing the field codes only, and you cannot toggle to the field values</p>	
Generate	<p>Generate the document (after you have set all the options you</p>	

Option	Action	See also
	require, on all tabs of the dialog)	
View	Launch the generated RTF Documentation in the MS Windows default RTF file viewer, or in the Enterprise Architect internal viewer if you have selected the Use Internal Viewer checkbox	
Edit Template	Edit the currently-named template using the RTF Style Template Editor You can only edit <i>user-defined</i> templates, not the standard templates provided with Enterprise Architect; standard template names are enclosed in parentheses	RTF Style Template Editor ^[1736]
Resource Document	Save the current options as a document definition	Document definition ^[1766]
Abort	Cancel report generation	

Notes:

- For an introduction to generating RTF documentation, see the *RTF Documents* topic
- If you have never selected the **Optimize for Open Office** checkbox, the document generator prompts you to confirm which document style you want to adopt - Microsoft Office or Oracle Open Office; once you have made a selection in this prompt, the document generator always acts on the status of the checkbox and does not display the prompt again

Topic	Detail	See also
Abstract	In versions of Enterprise Architect later than 7.1, a <i>Normal.rtf</i> template is provided as a system template, as an external file stored in: <code>%APPDATA%\Sparx Systems\EA\RTF Templates</code> This provides user-editable defaults of styles, numbering and other base formats; any styles modified in the <i>Normal.rtf</i> file reflect in newly created templates - one useful style is the default list numbering, <i>MasterList</i>	File and Print Options ^[1745]

Topic	Detail	See also
	<p>To edit the Normal.rtf template, use the RTF Style Template Editor to create a new template called, for example, <i>Normal</i>, and use the File Import menu option to import the Normal.rtf file into the Normal template; modify the Normal template as required, but ensure there is no text when you save it, just style definitions</p> <p>Export the modified template (File Export) back into the Normal.rtf file in the <i>RTFTemplates</i> folder</p> <p>A related feature in the RTF Style Template Editor is the File Update Styles menu option, which enables you to update existing templates to reflect any changes to <i>Normal.rtf</i></p>	

Reference:

The Templates tab has the following functions:

Field	Field	See also
Delete a template	Click on the template name and click on the Delete button	
Create a new template	<p>Click on the New button</p> <p>The New Document Template dialog displays, on which you specify the template name and the name of any existing template to act as the base for the new template</p> <p>To make it easier to get up and running, Enterprise Architect provides a basic template with default settings on which you can base new templates.</p> <p>Modify the template as required, using the RTF Style Template Editor.</p>	
Open the RTF Style Template Editor	<p>Click on the template name and click on the Edit button</p> <p>The Template: <Template name> screen displays, presenting the facilities of the RTF Style Template Editor.</p>	

To Import RTF Templates saved to XML files using the: **Project | Model Import/Export | Export Reference Data** menu option, follow the steps below

How To:

Step	Action	See Also
1.	Click on the Import From Reference File button.	
2.	On the Import Reference Data dialog, click on the Select File button and browse for and select the required file.	
3.	In the Select Datasets to Import panel, click on the required datasets.	
4.	Click on the Import button to import the template.	

The imported template displays in the list on the Templates tab of the Generate RTF Documentation dialog.

Notes:

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is switched on, you must have **Configure Resources** access permission to create RTF templates
- In the Normal.rtf template, you must not edit the *SSbookmark* style. This defines the section styles and must be preserved
- There are two methods of exporting and importing RTF templates out of and into models:
- If the template is in a batch file, export it using the **Project | Model Import/Export | Export Reference Data** menu option and import it using the **Templates** tab, as above
- If the template is a one-off copy, use the RTF Template Editor **File** menu options, **Export** and **Import**

17.1.1.5.1 RTF Style Template Editor

The **RTF Style Editor** enables you to create and edit custom RTF templates to define output RTF documentation associated with various sections of the *RTF Report* facility in Enterprise Architect. You typically use this facility to customize the look and feel of a report for your company or client.

Access: **View | More Project Tools | Project Resources > (one of the following folders) Templates, Document Templates, System or Model : View/Modify**

Topics:

Topic	Detail	See also
Usage	<p>You select particular model components and specify, from the component type, the fields to include in the generated document. You can define formatting styles in the RTF Style Template Editor, and add a range of items such as tables of contents or headers to the document.</p> <p>For information regarding specific commands to alter the format of the RTF documentation, see the entries under the RTF Style Template Editor Options topic.</p>	<p>Selecting Components for Recording^[1737]</p> <p>RTF Style Template Editor Options^[1743]</p>

Notes:

- You can transport these RTF templates between models, using the **Export Reference Data** and **Import Reference Data** options on the **Project | Model Import/Export** menu
- You can also access this in alternative ways, by:
 - Selecting to edit the current template on the **Generate** tab of the **Generate RTF Documentation** dialog
 - Selecting to edit a style template on the **Templates** tab of the **Generate RTF Documentation** dialog

17.1.1.5.2 Select Components for Reporting**How To:**

To select model components to be documented in the report, using the RTF Style Template Editor, follow the steps below:

Step	Action	See Also
1	Expand the Sections tree on the <template name> screen.	
2	Select the checkbox next to the component name; the component name is then displayed as a section tag in the Content panel. More specific guidance is provided for selecting the following components: <ul style="list-style-type: none"> • Linked Documents and Document Artifact Contents • Tabular Sections • Child Sections • Constraint and Scenario Sections 	Linked Documents and Document Artifact Contents ^[1737] Tabular Sections ^[1738] Child Sections ^[1740] Constraint and Scenario Sections ^[1741]
3	Add content to each report component. The position of the section tags within the Sections tree determines the position of the model component in the Content panel. For encapsulated components, selecting a child component automatically selects the parent also.	Add content ^[1742]

How To:

To move a model component to a different position in the documentation template, follow the steps below

Step	Action	See Also
1	Select the component in the Sections panel.	
2	Click on  and  to move the component up and down the Sections panel.	

Topics:

Topic	Detail	See also
Linked Documents and Document	Linked documents and documents created via the Document Artifact element are rendered into RTF Documentation by selecting the Linked Document checkbox in the RTF Style Template Editor.	Linked Documents ^[729] Creating Document

Topic	Detail	See also
Artifact Contents	<p>The Linked Document checkbox is within the Element hierarchy, towards the end. Remember that checkboxes can be moved up and down the hierarchy to position information in the generated document as you require. In some templates, the Linked Document checkbox is only available as a child of the External Requirements checkbox.</p> <p>The linked document is rendered into the RTF documentation at:</p> <p><i>linked document ></i></p> <p><i><linked document</i></p>	Artifacts ^[730]

Notes:

- If the Package.Diagram.Element checkboxes are selected, you must select either the **Document each contained element in RTF** checkbox in the **Diagram Properties** dialog for at least one included diagram, or the Include all **diagram elements in report** checkbox on the **Generate RTF Documentation** dialog

Learn More:

- [Diagram Options](#) ^[1729]
- [Generate RTF Documentation](#) ^[1732]

17.1.1.5.3 Tabular Sections

The **RTF Style Template Editor** supports rendering a document section as a table. A tabular section is defined as a table containing any number of columns, but with only *two* rows:

- The first row is used to describe the headings of the columns, which you type in and format yourself
- The second row defines the output, which you specify by right-clicking in each cell and selecting the output type from the field list; the output is then generated iteratively for every occurrence of the section in question

Topics:

Topic	Detail	See also
Example Tabular Section	<p>In the following example, the Model> Glossary> section is defined as a tabular section:</p> <pre>model > Model Glossary glossary > Term Type Meaning [ModelGlossary.Term] [ModelGlossary.Type] [ModelGlossary.Meaning] < glossary < model</pre> <p>This renders the following document output:</p>	

Topic	Detail	See also									
	<h3>Model Glossary</h3> <table border="1"> <thead> <tr> <th>Term</th> <th>Type</th> <th>Meaning</th> </tr> </thead> <tbody> <tr> <td>Accounting Periods</td> <td>Business</td> <td>A defined period of time whereby performance reports may be extracted. (normally 4 week periods).</td> </tr> <tr> <td>Association</td> <td>Technical</td> <td>A relationship between two or more entities. Implies a connection of some type - for example one entity uses the services of another, or one entity is connected to another over a network link.</td> </tr> </tbody> </table>	Term	Type	Meaning	Accounting Periods	Business	A defined period of time whereby performance reports may be extracted. (normally 4 week periods).	Association	Technical	A relationship between two or more entities. Implies a connection of some type - for example one entity uses the services of another, or one entity is connected to another over a network link.	
Term	Type	Meaning									
Accounting Periods	Business	A defined period of time whereby performance reports may be extracted. (normally 4 week periods).									
Association	Technical	A relationship between two or more entities. Implies a connection of some type - for example one entity uses the services of another, or one entity is connected to another over a network link.									

Notes:

- Under some circumstances, a table might repeat the header row rather than the output row; if this occurs, create another row in the table between the header row and the output row, and leave this blank
- If you type a carriage return between the end of the table and the section terminator, the table you generate has a line space between the rows. For example:

```

package">
{
}
element">

| Element Name | Author         |
|--------------|----------------|
| Element Name | Element Author |

</element>
</package>
    
```

← Carriage Return

This generates the following table:

	Element Name	Author
	Choose Recipient	John Redfern

Line Space

	Manage Contacts	Walter Frederick
--	-----------------	------------------

To avoid this, ensure that there is no carriage return between the end of the table and the section terminator, as follows:

```

package">
{
}
element">

| Element Name | Author         |
|--------------|----------------|
| Element Name | Element Author |

</element>
</package>
    
```

← No Carriage Return

This generates a table with no space between the rows, as follows:

	Element Name	Author
	Choose Recipient	John Redfern
	Manage Contacts	Walter Frederick

17.1.1.5.4 Child Sections

Child sections can be rendered in RTF documentation using one of the following two methods:

- Render model components directly into the RTF as defined by the section's content and fields.
- Render indirectly to the RTF by using a parent section to describe the content.

The second option occurs as a result of creating a section that has a placeholder section tag (that is, no content within the tags). This method is used to create recursive documentation of child packages.

Topics:

Topic	Detail	See also
Example: Rendered Sub-section	<p>This example shows a template with content between the <i>Child Element</i> tags. In this example child elements of the parent are rendered using the <i>Child Elements</i> section because it contains valid content and fields.</p> <pre> element> {Element.Name} Type: → → {Element.Type}..{Element.BaseClasses} Status: → → {Element.Status}..Version: {Element.Version}..Phase: {Element.Phase} Package: → → {Element.ParentPackage}..Keywords: {Element.Tag} Detail: → → Created on: {Element.DateCreatedShort} {Element.Notes} child element> → Child: {Element.Name} <child element <element </pre>	
Example: Non-rendered Sub-section	<p>This example shows a template with no content between the child element tags. In this example, child elements of the parent are rendered using the element section because the child element section is empty. The child element section is used as a placeholder.</p> <pre> element> {Element.Name} Type: → → {Element.Type}..{Element.BaseClasses} Status: → → {Element.Status}..Version: {Element.Version}..Phase: {Element.Phase} Package: → → {Element.ParentPackage}..Keywords: {Element.Tag} Detail: → → Created on: {Element.DateCreatedShort} {Element.Notes} child element> <child element <element </pre>	
Child Document Sections and Their Corresponding Parent Sections	Child Section	Section rendered when us
	Package->Child Package	Package
	Package->Element->Child Element	Package->Element
	Package->Element->Diagram	Package->Diagram

Topic	Detail	See also						
	<table border="1"> <thead> <tr> <th>Child Section</th> <th>Section rendered when us</th> </tr> </thead> <tbody> <tr> <td>Package->Diagram->Element</td> <td>Package->Element</td> </tr> <tr> <td>Package->Diagram->Connector</td> <td>Package->Element->Conne</td> </tr> </tbody> </table>	Child Section	Section rendered when us	Package->Diagram->Element	Package->Element	Package->Diagram->Connector	Package->Element->Conne	
Child Section	Section rendered when us							
Package->Diagram->Element	Package->Element							
Package->Diagram->Connector	Package->Element->Conne							

Notes:

- In principle, it is better to leave Child sections blank to replicate their parent sections. Child sections do not contain the same sub-section detail as their parents; for example: Element::Child Element does not contain sub-sections such as Scenario or Attribute, so where Child Element sections are populated, these sub-sections are not rendered. An exception to this is cases where sub-sections are not required, but different formatting of the section fields is preferred

17.1.1.5.5 Constraint and Scenario Sections

The template **content options** enable you to include sections in your reports for:

- constraints* on Package Elements, Elements, Connectors and Attributes, and
- scenarios* for Package Elements and Elements.

There are additional options in these types of section that enable you to determine what types of constraint or scenario are included in your reports, as described below.

Topics:

Topic	Detail	See also
Constraints	<p>The following constraint options are available for selection, as checkboxes in the Sections panel of the RTF Style Template Editor:</p> <ul style="list-style-type: none"> Pre-Constraint - select this checkbox to include all constraints of the type 'pre-condition' in this section of the report Post-Constraint - select this checkbox to include all constraints of the type 'post-condition' in this section of the report Constraint - select this checkbox to include all constraints that have not been generated in the Pre-Constraint and Post-Constraint sections of the report 	
Scenarios	<p>The following scenario options are available for selection, as checkboxes in the Sections panel of the RTF Style Template Editor:</p> <ul style="list-style-type: none"> Element > Scenario - select this checkbox to include all scenarios in this section of the report; if any of the following sections are also selected, the report includes all scenarios that are not exception paths Element > Scenario > Exception - select this checkbox to include all exceptions for each scenario Element > Scenario > Structured Scenarios - select this checkbox to include all scenario steps in the scenario sections of the report Element > Scenario > Structured Scenarios > Exception - select this checkbox to include the steps for each exception path in the scenario sections of the report

17.1.1.5.6 Add Content

The **RTF Style Template Editor** uses pairs of tags to define the layout of the documentation content. To insert a pair of model component tags into the **Content** section of the Editor, use the **Sections** panel of the **RTF Style Template Editor**.

The beginning of a model component is represented by a yellow highlighted `<sectionname >` tag; the end of the model component is represented by `<sectionname`.

To add model component content, follow the step below

How To:

Step	Action	See Also																																				
1	<p>Right-click in the area between the opening and closing tags. This displays a context menu that enables you to:</p> <ul style="list-style-type: none"> • perform simple text editing (cut, copy and paste) • select from a list of defined project constants to insert at the cursor position; if no project constants have been defined, the menu option is not available • select from a context-sensitive list of fields to add to this component section of the RTF Documentation; any additional information entered between the tags is also included in the generated RTF Documentation. <p>For example, in the <code><connector ></code> section shown below, the user has right-clicked in the fourth column of the table, underneath the <code><constraint</code> tag. They can then select to add another field to the Notes on each connector listed in the table.</p>  <p>The screenshot shows a table with the following structure:</p> <table border="1"> <thead> <tr> <th>Connector</th> <th>Source</th> <th>Target</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>{Connector.Type}</td> <td>source ></td> <td>target ></td> <td>{Connector.Notes}</td> </tr> <tr> <td>{Connector.Name}</td> <td>{ConnSource.Scope}</td> <td>{ConnTarget.Scope}</td> <td>constraint ></td> </tr> <tr> <td>{Connector.Direction}</td> <td>{ConnSource.Role}</td> <td>{ConnTarget.Role}</td> <td>{ConnConstraint.Type}</td> </tr> <tr> <td></td> <td>{ConnSource.RoleNote}</td> <td>{ConnTarget.RoleNote}</td> <td>{ConnConstraint.Name}</td> </tr> <tr> <td></td> <td>element ></td> <td>element ></td> <td>< constraint</td> </tr> <tr> <td></td> <td>{Element.Name}</td> <td>{Element.Name}</td> <td></td> </tr> <tr> <td></td> <td>< element</td> <td>< element</td> <td></td> </tr> <tr> <td></td> <td>< source</td> <td>< target</td> <td></td> </tr> </tbody> </table> <p>The context menu is open over the <code>< constraint</code> tag in the Notes column, showing options like 'Insert Field', 'Project Constants', 'Cut', 'Copy', and 'Paste'. The 'Insert Field' sub-menu is open, showing a list of fields: Direction, Guard, GUID, IsLeaf, IsRoot, Name, Notes, Stereotype, StereotypeEx, Type, and valueOf.</p>	Connector	Source	Target	Notes	{Connector.Type}	source >	target >	{Connector.Notes}	{Connector.Name}	{ConnSource.Scope}	{ConnTarget.Scope}	constraint >	{Connector.Direction}	{ConnSource.Role}	{ConnTarget.Role}	{ConnConstraint.Type}		{ConnSource.RoleNote}	{ConnTarget.RoleNote}	{ConnConstraint.Name}		element >	element >	< constraint		{Element.Name}	{Element.Name}			< element	< element			< source	< target		Project Constants ^[1772]
Connector	Source	Target	Notes																																			
{Connector.Type}	source >	target >	{Connector.Notes}																																			
{Connector.Name}	{ConnSource.Scope}	{ConnTarget.Scope}	constraint >																																			
{Connector.Direction}	{ConnSource.Role}	{ConnTarget.Role}	{ConnConstraint.Type}																																			
	{ConnSource.RoleNote}	{ConnTarget.RoleNote}	{ConnConstraint.Name}																																			
	element >	element >	< constraint																																			
	{Element.Name}	{Element.Name}																																				
	< element	< element																																				
	< source	< target																																				

Topics:

Topic	Detail	See also
The valueOf Field	<p>For certain sections, you can add a field to capture a special characteristic of a model component, as defined by a specific Tagged Value. This is the valueOf field, shown in the list for a connector section in the above graphic. The sections that provide the valueOf field are:</p> <ul style="list-style-type: none"> • Package • Element • Connector • Attribute • Operation • External Requirement <p>When you select the valueOf field from the context menu, the template editor prompts you to specify the tag (Tagged Value) from which to extract the value for the report output. This tag should be one of the tags associated with the model component, such as <code>ConnectorAltName</code> for a connector. When you provide the tag name, the template editor adds the field at the cursor position, in the format:</p> <pre>{Connector.valueOf(tagname)}</pre> <p>for example: <code>{Connector.valueOf(ConnectorAltName)}</code></p> <p>For clarity, you could type some lead-in text or the meaning of the Tagged Value immediately preceding the value field; for example:</p> <p>Alternative Name: <code>{Connector.valueOf(ConnectorAltName)}</code></p>	

Notes:

- If you select a field with short date format (such as *Pkg.DateCreatedShort*, *Diagram.DateModifiedShort* or *Element.DateCreatedShort*) the format is actually drawn from the MS Windows settings. To use a different short date format, click on the **Start** icon on the Windows desktop and select the **Control Panel | Regional and Language Options | Customize** option

- Throughout your template editing, be aware that:
 - To undo one or more immediately previous edits, press (**Ctrl+Z**), or select the **Edit | Undo** menu option. You can still undo a change even after you have saved the change
 - To redo one or more immediately previous undone edits, press (**Ctrl+Y**), or select the **Edit | Redo** menu option

17.1.1.5.7.1 Scroll Through Text

Scroll Using	Options
Keyboard Keys	Press <ul style="list-style-type: none"> (↑), (↓), (←) or (→) to scroll up or down a line, or left or right one character (Home) to move to the beginning of the current line (End) to move to the end of the current line (Ctrl+Page Up) to move to the beginning of a file (Ctrl+Page Down) to move to the end of a file (Page Up) to display the previous page (Page Down) to display the next page (Ctrl+←) to move to the previous word (Ctrl+→) to move to the next word (Ctrl+↑) to move to the first column of the current line (if not already on the first column) or the first column of the previous line (Ctrl+↓) to move to the first column of the next line (F10) (or select the Other Jump menu option), type in a line number to jump to, and click on the OK button
Mouse	Click on the vertical and horizontal scroll bar to perform various scrolling functions. These functions are available only if the horizontal or the vertical bar has been enabled by the startup parameters. Vertical Scroll Bar: Click on the arrows on either end to scroll the screen up or down by one line.

Scroll Using	Options
	<p>Click above the elevator to scroll the screen up by one page. Similarly, click below the elevator to scroll the screen down by one page.</p> <p>You can also drag the elevator to any position in the bar. As the elevator is dragged, the editor scrolls the screen up or down accordingly.</p> <p>Horizontal Scroll Bar: Click on the arrows on either end to scroll the screen left or right by one column. Click on either side of the elevator to scroll the screen left or right by 1/2 screen.</p> <p>You can also drag the elevator to any position in the bar. As the elevator is dragged, the editor scrolls the screen left or right accordingly</p>

17.1.1.5.7.2 File and Print Options

Command	Action	Shortcut	See also
New	<p>Clear an existing template from the edit window and start an empty, unnamed template.</p> <p>The editor prompts you to save any modification to the previous template.</p>		
Revert	Revert to the previously-saved copy of the template.		
Save	<p>Save the text to the current file name.</p> <p>If a file is not yet specified, the editor prompts you for a template name.</p>	Ctrl + S	
Save As	Similar to Save File , but you specify a new template name for saving the template.	Ctrl + Shift + S	
Import	<p>Import an existing RTF document into the Template Editor, so as to insert model elements from that document into the template.</p> <p>This option is useful when creating templates from a predefined document with a particular 'look and feel'.</p>		Import an existing RTF document ^[1765]
Export	<p>Save the template as an RTF document rather than as a template.</p> <p>This can be useful for saving the template for other models.</p>		
Update Styles	<p>Imports the styles from <i>Normal.rtf</i>, found in the RTF Templates directory.</p> <p>This option is useful when creating a Master Document / Sub Documents that require consistent user-defined styles across multiple templates (including such things as numbering formats).</p>		
Document Options	Display the Document Options dialog which enables you to set the filter and order the elements.		Document Options ^[1767]

Command	Action	Shortcut	See also
Page Layout	Specify the page layout, before selecting the Print option. You can specify the margins (left, right, top and bottom) in inches.		
Printer Setup	Invoke a printer-specific dialog for the default printer (the default printer selection is made from the Windows Control panel). You select the parameters from a set of printer-specific options. These options include page size, page orientation, resolution and fonts.	Ctrl + Shift + P	
Print	<p>Print the contents of the current file. The editor displays a dialog where you can select the scope of the printing. You can also choose to print only a selected part of the file.</p> <p>To print a block of text, highlight the required text before invoking the Print function. This command prints a highlighted:</p> <ul style="list-style-type: none"> • Line block • Character block <p>The Print function prints on a default printer selected from the Windows Control panel. You can alter the printer setup or page layout prior to invoking the Print function.</p>	Ctrl + P	
Print Preview	<p>Preview the document before printing. The editor displays up to two pages at a time. You can scroll to a different page using (Page Up) , (Page Down) or the scroll bar.</p> <p>By default the preview rectangle is sized to fit the current window. However, you can use the zoom option to enlarge or shrink the preview rectangle as required.</p> <p>Click on the Edit button or the File Print Preview menu option again to return to editing mode.</p>		
Close	Close the Template Editor. The editor prompts you to save any unsaved information.		

17.1.1.5.7.3 Cut and Paste Options

To	Action	See also
Highlight a word	Double-click on the word.	
Highlight a line	Move the cursor onto the line and press (F8) .	
Select all file content	Press (Ctrl+A) or select the Edit Select All menu option.	
Copy a block	<p>Highlight the lines of text to be copied and press (Ctrl+C) , or select the Edit Copy menu option.</p> <p>Move the cursor to the point at which to insert the text and press (Ctrl+V) or select the Edit Paste menu option.</p>	

To	Action	See also
Move a block	Highlight the lines of text to be moved and press (Ctrl+X), or select the Edit Cut menu option. The selected text is removed from the page. Move the cursor to the point at which to insert the text and press (Ctrl+V) or select the Edit Paste menu option.	
Delete a block	Highlight the lines of text to be deleted and press (Delete)	
Delete a line	Press (Shift+F9) to delete the current line. The remaining lines close up.	
Paste special objects	Select the Edit Paste Special menu option. The Paste Special dialog displays, listing the appropriate data type formats for pasting the copied object, as listed below. Click on the Paste button to embed the data into your application, or click on the Paste Link button to create a link to the original file. <u>Native Object Format</u> If available, this is the first format in the list box. You can edit data in this format using the original application, by double-clicking the object. <u>Formatted Text</u> A text format. This option offers the most suitable format if the data is pasted from another text output application, as the font and formatting attributes are reproduced accurately. <u>Unformatted Text</u> Another text format. This option pastes the text without retaining the formatting information. <u>Picture Format</u> The data is available in Picture format. You can later edit the object, by double-clicking on it and invoking the Microsoft MS Draw application. This format is preferred over the Bitmap and the Device Independent Bitmap formats. <u>Device Independent Bitmap and Regular Bitmap formats</u> The data is available in bitmap formats. You can later edit the object, by double-clicking on it and invoking the Microsoft MS Draw application. The editor converts these formats into the Picture format before calling the drawing application.	

17.1.1.5.7.4 View Options

Menu Option	Action	See also
Page Mode	Turn Page Mode on (the equivalent of <i>Print View</i> in Word) or off (the equivalent of <i>Normal View</i> in Word). In Page Mode , the editor displays one page at a time. It is most useful for documents containing multiple columns, as the	

Menu Option	Action	See also
	columns are displayed side by side.	
Fitted View	Turn Fitted View on or off. This is a special case of Page Mode , in which the text wraps to the window width and the soft page breaks are not displayed. If you select Fitted View , Page Mode is automatically selected too. If you deselect Page Mode , Fitted View is automatically deselected too.	
Ruler	Display or hide the ruler at the top of the page. The ruler shows tab stops and paragraph indentation marks; it can also be used to create or delete tab stops.	
Tool Bar	Display or hide the tool bar above the ruler. The tool bar provides a convenient method of selecting fonts, point sizes, character styles and paragraph properties. The tool bar also shows the current selection for font, point size and character styles.	
Status Ribbon	Display or hide the status ribbon at the bottom of the editing panel. The status ribbon displays the current page number, line number, column number and row number. It also indicates the current insert/overtyping mode.	
Paragraph Marker	Display or hide the paragraph marker (an inverted 'P') at the end of each paragraph. This option is useful when working with lines with many different heights.	
Hidden Text	Show or hide 'hidden' text. Text formatted with the hidden attribute is shown with a dotted underline. When the option is turned off, the hidden text is not visible.	Character Formatting Options <small>[1750]</small>
Field Names	Insert, show and hide field names. As you develop your RTF document, you right-click on sections to insert field markers. You cannot insert these markers unless you have selected the Field Names option. When you deselect the option, existing field names are obscured.	
Page Header/ Footer	Display or hide the text of page headers and footers. If Page Mode is not selected, this option turns Page Mode on. When Page Mode is selected, you cannot edit the header or footer text unless you also select the Edit Edit Page Header/Footer menu option. When Page Mode is deselected, you can see and edit page headers and footers at the start of the document.	Headers and Footers <small>[1754]</small>
Page Border	Display or hide a page outline in Page Mode . When Page Mode is deselected, this option is not available. When Page Border is selected, the document contents are shown within a page outline. When Page Border is deselected,	

Menu Option	Action	See also
	the document contents are formatted within the boundaries of the editing screen.	
Zoom	Shrink or enlarge the display of the document text, by selecting the appropriate percentage enlargement. The editor supports zoom percentages from 25 to 200.	

17.1.1.5.7.5 Image and Object Inserts

To	Action	See also
Embed a picture in the document	Position the cursor at the point at which to insert the picture bitmap or Windows metafile, and either: <ul style="list-style-type: none"> • Select the Insert Embed Picture menu option, or • Press (Alt+F8) . A browser dialog displays, through which you select the picture to embed in the document. The picture displays at the current cursor location. The embedded picture is saved within the document.	
Link a picture file to the document	Position the cursor at the point at which to link the picture bitmap or Windows metafile, and select the Insert Link Picture menu option. A browser dialog displays, through which you select the picture to link to the document. The picture displays at the current cursor location. Linked picture data is not saved with the document, only the filename is stored within the document.	
Embed an Ole object in the text	Position the cursor at the point at which to embed the object, and select the Insert Ole Object menu option. The Insert Object dialog displays, listing the applications that are available to create the object. When you select an application, the editor launches it and you create the required object using this application. When you save the application, the editor inserts an icon that indicates the inserted object. You can later edit the object using the application, by double-clicking on the object. You can also use the Edit Paste Special menu option to import the OLE objects, provided that the object is available in the clipboard.	Block editing 
Edit an embedded picture	Click on the picture and select the Edit Edit Picture menu option. The Edit Current Picture Parameters dialog displays, through which you can change the width and height of the picture, in inches. You can also align the top, bottom, or middle of the picture with the base line of the text.	
Edit an embedded Ole object	Double-click on the icon that indicates the inserted Ole object. Alternatively, position the cursor on the icon and select the Edit Edit Ole Object menu option. The editor opens the object in the application used to create it, and you can edit the object.	

To	Action	See also
Insert a background picture for the text	Select the Other Background Picture menu option. A browser dialog displays, through which you select the bitmap or metafile file to insert as a background picture. The picture occupies the entire text area. To remove the background picture, deselect the Background Picture menu option.	
Insert an RTF File	Position the cursor at the point at which to insert the file, and select the Insert Insert RTF File menu option.	

17.1.1.5.7.6 Character Formatting

When you change the format of existing text, any new characters you type immediately following automatically assume the formatting characteristics of the existing text.

To	Action	See also
Apply character format	Highlight the text to which to apply the format, and use one or more of the following menu options or key combinations, as required: <ul style="list-style-type: none"> • Font Normal, or press (Alt+0) • Font Bold, or press (Ctrl+B) • Font Underline, or press (Ctrl+U) • Font Double Underline, or press (Ctrl+D) • Font Italic, or press (Ctrl+I) • Font Superscript, or press (Alt+4) • Font Subscript, or press (Alt+5) • Font Strike, or press (Alt+6) (puts a line through the text) • Font All Caps • Font Small Caps <p>To reset any character format, highlight the text and select the Font Normal menu option, or press (Alt+0) .</p>	
Change font typeface and point size	Highlight the text to change and select the Font Fonts menu option, or press (Alt+F10) . The Font Selection dialog displays, from which you select the required typeface and point size. Click on the OK button.	
Change character style	Highlight the text to change and select the Font Style menu option. The Select a Style dialog displays, listing the currently-defined character styles in the template stylesheet. Select the required style and click on the OK button.	Template stylesheet ^[1759]
Change the color of text, background (permanent highlight) or underline	Highlight the text to change and select one or more of the following options, as required: <ul style="list-style-type: none"> • Font Text Color • Font Background Color • Font Underline Color <p>In each case, the Color dialog displays, through which you can select or define the required color. When you have selected a color, click on the OK button.</p>	
Change character	Normal character spacing is 20 Twips. If you want to change	

To	Action	See also
spacing	<p>this (or return to it), highlight the text to adjust, and select the Font Spacing menu option. The Character Spacing dialog displays.</p> <p>Select the radio button to expand or compress spacing, or to return to normal spacing. If you are changing from normal spacing, enter the number of Twips to set the spacing to. Click on the OK button.</p>	
Hide text	<p>Hidden text is not displayed on the screen or printer, but remains in the document and is not deleted.</p> <p>Highlight the text to hide and select the Font Hidden menu option, or press (Ctrl+H). The highlighted text is not displayed and the rest of the text closes up.</p> <p>To view hidden text, select the View Hidden Text menu option. You can then make the text normal again by highlighting it and deselecting the Font Hidden menu option.</p>	
Box text	Highlight the text to box and select the Font Boxed menu option. This creates a broken-line border around the selected text.	
Insert a non-breaking space	Move the cursor to the point at which to insert the non-breaking space and select the Insert Non-breaking Space menu option.	
Insert a non-breaking dash	Move the cursor to the point at which to insert the non-breaking dash and select the Insert Non-breaking Dash menu option.	
Insert an optional hyphen	Move the cursor to the point at which to insert the hyphen and select the Insert Optional Hyphen menu option.	

17.1.1.5.7.7 Paragraph Formatting

The functions described below operate on the current paragraph, or on a **highlighted** block of text.

To	Action	See also
Clear all paragraph formatting	Select the Paragraph Normal menu option. The editor pushes the paragraph back up to the page margin.	
Set text flow in document	<p>To set the text flow for:</p> <ul style="list-style-type: none"> • A selected block of text, select the Paragraph Text Flow menu option; the Paragraph Text Flow dialog displays • The entire document, select the Edit Document Text Flow menu option; the Document Text Flow dialog displays. <p>In either case, select the required text flow direction and click on the OK button.</p>	
Center text	Select the Paragraph Center menu option or press (Alt+8) .	
Right-justify text	Select the Paragraph Right Justify menu option or press (Alt	

To	Action	See also
	+9) .	
Justify both sides of text	Select the Paragraph Justify Both menu option.	
Set double line spacing	Select the Paragraph Double Space menu option. A double-spaced paragraph has a blank line between each text line.	
Indent paragraph left	Select the Paragraph Indent Left menu option or press (Alt+L). Select the option again to increase the indent.	
Indent paragraph right	Select the Paragraph Indent Right menu option or press (Alt+R). Select the option again to increase the indent.	
Create hanging indent	Select the Paragraph Hanging Indent menu option or press (Alt+T). Select the option again to increase the indent of all lines below the first.	
Keep paragraph lines together	Select the Paragraph Keep Together menu option. The editor attempts to keep all lines within the paragraph on the same page.	
Keep paragraph with next	Select the Paragraph Keep with Next menu option. The editor attempts to keep the last line of the current paragraph and the first line of the next paragraph on the same page.	
Prevent 'widow' and 'orphan' lines	Select the Paragraph Widow/Orphan Control menu option. The editor attempts to avoid having: <ul style="list-style-type: none"> the first line of the paragraph on the previous page ('widow' line) the last line of the paragraph on the next page ('orphan' line). 	
Start text on new page	Move the cursor to the point at which to start the new page, and select the Paragraph Page Break Before menu option.	
Insert border and shading for text block	Highlight the required text and select the Paragraph Border and Shading menu option. The Paragraph Box Parameters dialog displays, on which you specify which sides of the box to display (including a line between text lines), whether the lines are thick or doubled, the degree of gray shading behind the text, and the color of the lines.	
Define line spacing	Highlight the required lines and select the Paragraph Paragraph Spacing menu option. The Paragraph Spacing Parameters dialog displays, on which you specify the line spacing and the point spacing before and after lines.	
Set a background color for text space	Highlight a text string or block of text and select the Paragraph Background Color menu option. The Color dialog displays, on which you select the background color. The editor highlights the full width of the page in that color, for the selected lines.	
Create a bulleted list	Highlight the required lines of text and select the Paragraph Bullet menu option. The editor formats the lines into a simple bullet list.	
Create a numbered list	Highlight the required lines of text and select the Paragraph Numbering menu option. The editor formats the lines into a

17.1.1.5.7.8 Tab Support

The RTF Style Template Editor supports *left*, *right*, *center* and *decimal* tabs. Tabs are very useful for creating columns and tables. A paragraph can have as many as twenty tab positions.

A tab usually applies to every line of the current paragraph. However, if you highlight a block of text before setting a tab, the tab then applies to every line in the highlighted text.

Topics:

Topic	Detail	See also
	<p>You can create tabs quickly and easily using the ruler at the top of the screen. To create a:</p> <ul style="list-style-type: none"> • Left tab, click on the required tab position on the ruler; the left tab is indicated on the ruler by an L shape. • Right tab, right-click on the required tab position on the ruler; the right tab is indicated on the ruler by a reversed L shape • Center tab, press (Shift) and click on the required tab position on the ruler; the center tab is indicated on the ruler by an inverted T shape • Decimal tab, press (Shift) and right-click on the required tab position on the ruler; the decimal tab stop is indicated on the ruler by an inverted T shape with a dot on the right hand side. This tab is for numbers with a decimal point; numbers scroll left from the tab until you type a point, then numbers scroll right <p>You can also set tabs using the Paragraph Set Tab menu option, which displays the Set a Tab Position dialog. This enables you to specify the tab type, and provides two advantages over the ruler: you can set the tab position with more precision and with a clear value that you can duplicate; and you can add a tab leader line (dot, hyphen, or underline).</p>	

Topic	Detail	See also
	<ul style="list-style-type: none"> To clear a single tab position for selected text, select the Paragraph Clear Tab menu option. The Clear a Tab Position dialog displays, on which you select the tab to clear To clear all tab stops for selected text, select the Paragraph Clear All Tabs menu option To move a tab position using the mouse, click on the tab symbol on the ruler and drag it to the new position 	

Notes:

- The **Other | Snap To Grid** menu option affects the movement of the tabs (and the paragraph indentation markers) on the ruler. When you select this option, the movements of the tab markers are locked on to an invisible grid at intervals of 1/16 inch (half a ruler division)

17.1.1.5.7.9 Page Breaks and Repagination

You can force a page break in the document by selecting the **Insert | Insert Break | Page Break** menu option, or by pressing (**Ctrl+Enter**). The forced page break is indicated by a solid line in the editing window.

If **Page Mode** is off, the editor also marks automatic page breaks when the text overflows a page; these are indicated by a dotted line.

You can repaginate your document, using the **Edit | Repaginate** menu option. This updates the **Page Number** and **Page Count** fields, and recompiles the table of contents.

You insert the **Page Number** and **Page Count** fields as follows:

Topic	Detail	See also
Insert the page number	Position the cursor at the point at which to display the page number, and select the Insert Page Number menu option. The page number is displayed in gray.	
Insert the page count	Position the cursor at the point at which to display the total number of pages in the document, and select the Insert Page Count menu option. The page count is displayed in gray.	

17.1.1.5.7.10 Headers and Footers

To	Action	See also
Edit the page header and footer text	<p>In Page Mode, select the Edit Edit Page Header/Footer menu option. A paragraph marker displays at the top and bottom of each page, and you can type in, format or delete the appropriate text.</p> <p>If Page Mode is turned off, all page headers and footers are displayed in a block at the start of the document, with identifying labels. You can also edit the text here.</p> <p>Each section in a document can have its own page header and footer.</p>	
Create the header and footer for the initial page of the document	In Page Mode, select the Edit Edit Page Header/Footer menu option and then select the Edit First Page Header/Footer Create First Page Header or Create First Page Footer menu option. A paragraph marker displays at the top or bottom of the first page, and you can type in and format the appropriate text.	

To	Action	See also
	If Page Mode is turned off, all page headers and footers are listed in a block at the start of the document, with identifying labels. You can also edit the text here.	
Delete the header and footer for the initial page of the document	<p>Whilst you can delete the first page header or footer text by simple editing, you must specifically delete the 'first page' assignment in order to display the header and footer text of the next section on the first page.</p> <p>In Page Mode, select the Edit Edit Page Header/Footer menu option and then select the Edit First Page Header/Footer Delete First Page Header or Delete First Page Footer menu option. This removes the first page text and assignment, and displays the next-defined header and footer text.</p>	
Create a footnote	<p>Move the cursor to the position at which to insert the footnote marker, and select the Insert Footnote/Endnote Footnote menu option. The Footnote Parameters dialog displays, on which you enter the footnote marker and footnote text, and select whether to make the marker a superscript.</p> <p>Click on the OK button. The editor inserts the footnote marker at the current cursor location and, in Page Mode, displays the footnote text at the bottom of the page.</p>	
Edit footnote text	<p>Select the Edit Edit Footnote/Endnote Edit Footnote Text menu option. The text of each footnote displays in the document text where its marker was inserted. Locate the text and make the required changes. In Page Mode, the modified footnote displays at the bottom of the page.</p> <p>When you have finished editing footnote text, <i>deselect</i> the Edit Edit Footnote/Endnote Edit Footnote Text menu option. The footnote text is no longer shown in the document text.</p>	
Create an endnote	<p>Move the cursor to the position at which to insert the endnote marker, and select the Insert Footnote/Endnote Endnote menu option. The Endnote Parameters dialog displays, on which you enter the endnote marker and endnote text, and select whether to make the marker a superscript.</p> <p>Click on the OK button. The editor inserts the endnote marker at the current cursor location and, in Page Mode, displays the endnote text at the end of the section or document.</p>	
Edit endnote text	<p>Select the Edit Edit Footnote/Endnote Edit Endnote Text menu option. The text of each endnote displays in the document text where its marker was inserted. Locate the text and make the required changes. In Page Mode, the modified endnote displays at the bottom of the page.</p> <p>When you have finished editing endnote text, <i>deselect</i> the Edit Edit Footnote/Endnote Edit Endnote Text menu option. The endnote text is no longer shown in the document text.</p>	

17.1.1.5.7.11 Hyperlinks and Bookmarks

Topic	Detail	See also
Manage bookmarks	Each template contains a number of bookmarks that mark the sections. You can apply these bookmarks to related sections, create and assign your own, delete those that are not required, and locate	

Topic	Detail	See also
	<p>specific bookmarks in the document.</p> <p>In Page Mode, select the Insert Bookmark menu option. The Bookmark dialog displays.</p> <ul style="list-style-type: none"> • To assign a bookmark to the current cursor position, either type a new bookmark in the top field or select one from the list, and click on the Insert button. • To delete an existing bookmark, click on it in the list and click on the Delete button. • To mark a bookmark with the number of the page it is on, click on the bookmark in the list and click on the Set Page Reference button. • To locate a bookmark in the text, click on it in the list and click on the Go to button. 	
Insert hyperlinks	<p>Right-click on the point at which to create the hyperlink and select the Insert Hyperlink context menu option. The Insert Hyperlink dialog displays. You can create a hyperlink within an RTF document to an external document, Help topic or web page.</p> <p>In the Link Text field type the text to be hyperlinked, and in the Link Code field type or paste the web page URL, help topic file or external file path and name.</p> <p>To capture the help topic file name, right-click on the displayed topic, select the Properties context menu option, and copy the file name. When you insert the file name in the Link Code field, ensure that the file name has the prefix <code>\$Help://</code>.</p> <p>Click on the OK button. The hyperlinked text displays in the document. Double-click on the link to display the web page or external document.</p>	

17.1.1.5.7.12 Table Commands

The **Table** menu enables you to create a new table, or to edit an existing table's attributes.

To	Action	See also
Insert a table in the document	<p>Position the cursor at the appropriate point, and select the Table Insert Table menu option. The New Table Parameters dialog displays, in which you specify the number of table rows and columns.</p> <p>The editor initially creates cells of equal width. You can, however, change the cell width by dragging the cell borders using the mouse. When Page Mode is deselected, the table structure is not visible.</p>	
Add a header row	<p>Select the rows to act on, and then select the Table Header Row menu option. Apply any heading settings and formatting to the rows in the highlighted block.</p>	
Insert a new row above the current row	<p>Select the Table Insert Row menu option.</p>	
Insert a new column to the left of the current column	<p>Select the Table Insert Column menu option.</p>	

To	Action	See also
Merge cells	Select the cells to merge and select the Table Merge Cells menu option. The width of the resulting cell is equal to the sum of the merged cells. You can merge cells across a row, down a column, and in a block spanning both rows and columns.	
Split a cell	Select the cell to split and select the Table Split Cell menu option. The selected cell is split into two cells of equal width. Any text in the original cell is assigned to the first cell. The second cell is created empty.	
Delete cells	Select the cells to delete and select the Table Delete Cells menu option. The Delete Table Cells dialog displays, on which you specify whether to delete: <ul style="list-style-type: none"> • Cells - deletes the highlighted cells • Columns - deletes all the cells in the highlighted column or columns • Rows - deletes all the cells in the highlighted row or rows. If you delete all cells in a table, the table itself is automatically deleted.	
Position the table on the page	Click on any part of the table and select the Table Row Position menu option. The Table Row Alignment dialog displays, on which you select to left-align, center or right-align the table on the page. This option has little effect if the table is wide enough to span the page or text column.	
Set the height of a row, or all rows	Select the row to adjust and select the Table Row Height menu option The Row Height Parameters dialog displays, enabling you to set an automatic row height, a minimum row height, or an exact row height. You can apply the setting to the selected rows only, or to all rows in the table.	
Keep row text together if it continues over a page	Select the rows to protect (preferably all rows in the table) and select the Table Keep Row Together menu option. If the row continues over the end of the page, the whole row is moved to the top of the next page.	
Set text flow in rows	Select the rows and select the Table Row Text Flow menu option. The Table Text Flow dialog displays, on which you select the direction of flow of the text and select to apply the setting to the selected rows or all rows in the table. This option also moves the whole row over to the appropriate side of the page or column.	
Set the width of selected cells	Select the cells to act on and select the Table Cell Width menu option. The Set Cell Width dialog displays, on which you set the cell width and text margin and apply them to: <ul style="list-style-type: none"> • All cells in a highlighted block • The selected cells only • All cells in the selected column or columns, or • All cells in the selected row or rows. 	
Define the cell border width	Select the cells to act on and select the Table Cell Border Width menu option. The Set Cell Border dialog displays, on which you set the width of the line at any or all of the top, bottom, left and right of a cell, or whether to draw a uniform border around the cells. You can also set the text margin, and apply all the settings to: <ul style="list-style-type: none"> • All cells in a highlighted block 	

To	Action	See also
	<ul style="list-style-type: none"> • The selected cells only • All cells in the selected column or columns, or • All cells in the selected row or rows. 	
Define the cell border color	<p>Select the cells to act on and select the Table Cell Border Color menu option. The Set Cell Border Color dialog displays, on which you set the color of the line at any or all of the top, bottom, left and right of a cell, or whether to have a uniformly colored border around the cells. You then apply the settings to:</p> <ul style="list-style-type: none"> • All cells in a highlighted block • The selected cells only • All cells in the selected column or columns, or • All cells in the selected row or rows. 	
Define the cell shading	<p>Select the cells to act on and select the Table Cell Shading menu option. The Cell Shading Parameters dialog displays, on which you set the shading percentage. The value 0 indicates the palest background, whereas the value 100 indicates a black background. You then apply the setting to:</p> <ul style="list-style-type: none"> • All cells in a highlighted block • The selected cells only • All cells in the selected column or columns, or • All cells in the selected row or rows. 	
Define the cell background color	<p>Select the cells to act on and select the Table Cell Color menu option. The Cell Color Parameters dialog displays, on which you set the cell background color. You then apply the color to:</p> <ul style="list-style-type: none"> • All cells in a highlighted block • The selected cells only • All cells in the selected column or columns, or • All cells in the selected row or rows. 	
Vertically align cells	<p>Select the cells to act on and select the Table Cell Vertical Align menu option. The Cell Vertical Alignment dialog displays, on which you select to align the selected cells by top, center, bottom or baseline. You then select to align:</p> <ul style="list-style-type: none"> • All cells in a highlighted block • The selected cells only • All cells in the selected column or columns, or • All cells in the selected row or rows. 	
Rotate cell text	<p>Select the cells to act on and select the Table Cell Rotate Text menu option. The Cell Text Rotation dialog displays. On which you select to display text horizontally across the cell, vertically up the cell, or vertically down the cell. You then select to apply the rotation to:</p> <ul style="list-style-type: none"> • All cells in a highlighted block • The selected cells only • All cells in the selected column or columns, or • All cells in the selected row or rows. 	
Select column	<p>Click on a cell and select the Table Select Current Column menu option. The whole column is highlighted and selected for further formatting.</p>	
Show / hide table outline	<p>Click on a table cell and select the Table Show Gridlines menu option. This displays or hides the grid lines around the table cells. The</p>

17.1.1.5.7.13 Sections and Columns

The editor enables you to divide a document into multiple sections. A multiple section document is useful to:

- Vary the page margins from one page to another
- Create multiple columns of text.

To	Action	See also
Create a new section	Select the Insert Insert Break Section Break menu option. This creates a new section on a new page. This option is not available when Edit Edit Page Header/ Footer is active.	
Edit the section parameters	Select the Edit Edit Section menu option. The Section Parameters dialog displays. Define: <ul style="list-style-type: none"> • The number of columns and column spacing; text in a multiple column section wraps at the end of the column. When the text reaches the end of the page, it resumes in the next column. When Page Mode is off, the page contains a single very thin and long column. When Page Mode is on, the correct column layout is shown. • The orientation - Portrait or Landscape • Whether to start the new section on the next page • The direction of text flow • Any special printing characteristics for the section. You can also define any special page margins by selecting the File Page Layout menu option.	File and Print Options ^[1745]
Delete a section break	Move the cursor onto the section break line and press (Delete).	
Create a column break	Move the cursor to the appropriate point in the text and select the Insert Insert Break Column Break menu option. Normally in a multiple column section, the text flows from the end of one column to the top of the next column. A column break forces the text to the next column before the current column is completely filled. A column break is indicated by a line with a 'dot and dash' pattern. To delete the column break, simply position the cursor on the column break line and press (Delete).	

17.1.1.5.7.14 Stylesheets and Table of Contents

The editor supports *Character* and *Paragraph-type* stylesheet style items:

- The Character stylesheet style constitutes a set of character formatting attributes and is applied to a character string
- The Paragraph stylesheet style constitutes both a set of character formatting attributes and a set of paragraph formatting attributes, and is applied to one or more paragraphs

You can also include special, structured text in the document, such as **page number**, **date and time** and **text input** fields.

To	Action	See also
Use double-byte characters	Select the Edit Inline Ime menu option This enables you to enter double-byte characters without using an external IME application	
Create and edit styles	Select the Edit Edit Style menu option The Edit Stylesheet dialog displays Select the appropriate radio button to define a character style or a paragraph style Either select an existing style to modify from the list box, or type in a name for a new style; click on the OK button to begin recording the style properties You can use the ruler, toolbar or menu selections to modify the style items; these also reflect the currently-selected properties for the stylesheet item - please note that the paragraph properties are enabled only for the paragraph stylesheet items After you have defined the required style, either select the Edit Edit Style menu option again or click anywhere in the document: <ul style="list-style-type: none"> • If you modified an existing stylesheet item, the document automatically reflects the updated style • If you created a new stylesheet item, you can apply the style to highlighted text by selecting the Font Style or Paragraph Style menu options 	
Apply character styles	Select the Font Style menu option to apply a stylesheet style to a highlighted character string	
Apply paragraph styles	Select the Paragraph Style menu option to apply a stylesheet style to a highlighted paragraph or range of paragraphs	
Insert a table of contents	Create and apply the required heading styles using the Edit Edit Style menu option, as above Move the cursor to the point at which to insert the table of contents and select the Insert Table of Contents menu option The table of contents is automatically updated whenever repagination occurs	Repagination n ₁₇₅₄
Insert date and time fields	Move the cursor to the point at which to insert the current date and time, and select the Insert Date and Time menu option The Insert Current Date/Time dialog displays, from which you select the required date and time format The date and time are automatically updated whenever the page text is refreshed	
Insert your own data fields	Not Supported In The Enterprise Architect RTF Generator Move the cursor to the point at which to insert the data field and select the Insert Data Field menu option The Data Field Parameters dialog displays, in which you enter the field name and data value

Insert your own text entry field	<p>Move the cursor to the point at which to insert the text entry field and select the Insert Text Input Field menu option</p> <p>The Input Field Parameters dialog displays, in which you enter:</p> <ul style="list-style-type: none"> • The field name • The initial value to display as a default • The maximum length of the field • The text font in which to display the text <p>You also specify whether or not the field has a border</p>	
Insert a selectable checkbox	<p>Move the cursor to the point at which to insert the checkbox and select the Insert Checkbox Field menu option</p> <p>The Checkbox Field Parameters dialog displays, in which you enter:</p> <ul style="list-style-type: none"> • The field name • Whether it defaults to selected • The size of the box surrounding the check 	
Define level numbering in generated document	<p>Select the Edit List and Overrides menu option</p> <p>Set up the numbering list and the list overrides</p> <p>Apply the numbering list to the headings set for packages and elements, using paragraph numbering</p>	User defined list numbering [1761]

17.1.1.5.7.15 User-Defined Section Numbering

You might want to define the numbering format for the section levels in your generated RTF document.

For example:

- ```

1. Package Level 1
 1.1 Package Level 2 (child package)
 1.1.1 Element Level 1
 1.1.1.1 Element (child element)

```

To define the numbering format you first create a numbering list and then create a set of list overrides for this list. The overrides must also have the initial 1.0.0 setting altered to 1.1.1. You can then apply the numbering list to the headings set for packages and elements, using paragraph numbering.

(See **Section Numbering in Virtual Documents** for further information on applying continuous section numbering throughout a **Virtual Document**.)

To define the numbering format, follow the steps below

#### How To:

| Step | Action                                                                                                                                                  | See Also |

| 1.   | In the <b>Template Editor</b> , select the <b>Edit   List and Overrides   Create List Item</b> menu option. The <b>List Properties</b> dialog displays. |          |
| 2.   | In the <b>List Name</b> field, type a name for the list. Click on the <b>OK</b> button to close the dialog.                                             |          |
| 3.   | Select the <b>Edit   List and Overrides   Create List Override</b> menu option. The <b>List Override Properties</b> dialog displays.                    |          |

| Step | Action                                                                                                                                                                                                                                                                                                                                                              | See Also |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 4.   | In the <b>List to Override</b> field, type or select the name of the list you have just created. Click on the <b>OK</b> button to close the dialog.                                                                                                                                                                                                                 |          |
| 5.   | To set the list level properties for each level, select the <b>Edit   List and Overrides   Edit List Level</b> menu option. The List Level Properties dialog displays.                                                                                                                                                                                              |          |
| 6.   | To set the first level numbering (used in the Package Section), select the <b>List override</b> radio button and type or select the <b>list override</b> item you have just created.                                                                                                                                                                                |          |
| 7.   | Ensure that the <b>List Level</b> field is set to <b>1</b> (for Packages) and the <b>Number text</b> field is set to ~1~. Click on the <b>OK</b> button to save the values and close the dialog.                                                                                                                                                                    |          |
| 8.   | Open the dialog again ( <b>Edit   List and Overrides   Edit List Level</b> ) and set: <ul style="list-style-type: none"> <li>• <b>List Level</b> to <b>2</b> (for the <i>Element Section</i> or <i>Child Package Section</i>, for example)</li> <li>• <b>Start at</b> to <b>1</b> (to ensure that numbering at this level begins at 1.1 rather than 1.0)</li> </ul> |          |
| 9.   | Click on the <b>OK</b> button to close the dialog and save the changes.                                                                                                                                                                                                                                                                                             |          |
| 10.  | Repeat steps 5 to 9 as required, incrementing the list level number and resetting <b>Start</b> at to <b>1</b> each time.                                                                                                                                                                                                                                            |          |

To apply the numbering levels you have defined (above), follow the steps below

#### How To:

| Step | Action                                                                                                                                                                                                                                                                                                                                                    | See Also |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 1.   | In the <b>Content</b> window of the <b>Template Editor</b> , select the first item of text to be numbered (for example, <i>Package</i> ).<br><br><pre> package-&gt;  Package: {Pkg.Name}   element-&gt;  Element: {Element.Name}   child-elements-&gt;  &lt;-child-elements  &lt;-element  child-packages-&gt;  &lt;-child-packages  &lt;-package  </pre> |          |
| 2.   | Set the text style, using the style drop-down field in the <b>Template Editor</b> toolbar.<br><br><pre> package-&gt;  Package: {Pkg.Name} ¶ </pre>                                                                                                                                                                                                        |          |
| 3.   | Click on the <b>Paragraph   List Numbering</b> menu option. The <b>Apply paragraph numbering using Lists</b> dialog displays                                                                                                                                                                                                                              |          |
| 4.   | Select the required Numbering List and Override, and set the <b>Level</b> field                                                                                                                                                                                                                                                                           |          |

| Step | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | See Also |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|      | <p>to the required level (1, for the top level). Click on the <b>OK</b> button to close the dialog, and check that the required level has been applied to the selected text.</p> <p><b>package&gt;</b></p> <p><b>1. Package:-{Pkg.Name}</b></p>                                                                                                                                                                                                                                                                                                                                                          |          |
| 5.   | <p>Repeat steps 1 to 4 for the next level (Element), but at step 4 change the <b>Level</b> field to 2.</p> <p><b>element&gt;</b></p> <p><b>1.1 Element:-{Element.Name}</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                           |          |
| 6.   | <p>Continue applying the overrides for lower section levels as necessary, then save the template and generate your RTF report. The output should now resemble the following example:</p> <p><b>1. Package: Formal Requirements</b></p> <p><b>1.1 Package: Manage Users</b></p> <p><b>1.1.1 Element: REQ011 - Manage User Accounts</b></p> <p><b>1.1.2 Element: REQ016 - Add Users</b></p> <p><b>1.2 Package: Manage Inventory</b></p> <p><b>1.2.1 Element: REQ019 - Manage Inventory</b></p> <p><b>1.2.2 Element: REQ020 - Receive Books</b></p> <p><b>1.2.3 Element: REQ021 - List Stock Levels</b></p> |          |

**17.1.1.5.7.16 Frames and Drawing Objects**

A frame is a rectangular area that can contain both text and pictures on the page. The text *outside* the frame flows around it. A drawing object can be a text box, rectangle or a line. The drawing object *overlays* the text around it. You can see frames and drawing objects only if **View | Page Mode** is selected. However, the *content* of a frame or text box is still visible if **Page Mode** is deselected.

| To                                                      | Action                                                                                                      | See also |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|----------|
| Embed a frame or drawing object at the cursor position  | Select the <b>Insert   Frame</b> or <b>Insert   Drawing Object</b> menu option.                             |          |
| Insert text into the frame or drawing object text box   | Click inside the outline and type the text at the cursor position.                                          |          |
| Rotate text to display it down the side of the frame or | Select the <b>Edit   Edit Frame/Drawing Object   Rotate Text</b> menu option and select the text direction. |          |

| To                                                                                                           | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | See also |

| Insert a picture into a frame or drawing object text box                                                     | Copy the picture, click inside the outline and paste the picture at the cursor position.                                                                                                                                                                                                                                                                                                                                                                                                      |          |
| Size a frame or drawing object                                                                               | Click inside the outline, click on a sizing tab on the outline and drag the tab to the required position.<br><br>If the frame or text box contains only a picture, the picture size is automatically adjusted to fill the outline. Any text inside the outline is automatically wrapped to adjust to the new width.<br><br>In a frame the frame height is automatically adjusted, if necessary, to enclose all lines. In a text box, you must adjust the height manually to enclose the text. |          |
| Move the frame or drawing object                                                                             | Click inside the outline and then move the cursor just outside the outline so that the cursor changes to a plus-shape. Drag the plus shape (and hence the outline) to the new location.                                                                                                                                                                                                                                                                                                       |          |
| Edit the relationship between a frame or drawing object and a point on the page (the vertical base position) | Click on the outline and select the <b>Edit   Edit Frame/Drawing Object   Vertical Base Position</b> menu option. Select the point to lock the outline to. Outlines locked to the top of the page or the top of the margin retain their vertical position when you insert text before them.                                                                                                                                                                                                   |          |
| Edit the border and the background of a drawing object                                                       | Select the <b>Edit   Edit Frame/Drawing Object   Edit Drawing Object</b> menu option. On the <b>Line and fill attributes</b> dialog, select the options for the preferred border, line color, fill color and wrapping effect on the template text.                                                                                                                                                                                                                                            |          |
| Delete a frame or drawing object                                                                             | Click on the outline and press ( <b>Delete</b> ). The editor prompts you to confirm the deletion. Click on the <b>OK</b> button. Note that the deletion is actually reversible - press ( <b>Ctrl+Z</b> ) or select the <b>Edit   Undo</b> menu option.                                                                                                                                                                                                                                        |          |

#### 17.1.1.5.7.17 Search and Replace Commands

The first three menu options below all invoke the Search String Parameters dialog, if no search term has been defined.

Specify the term to search for, whether to search from the start of the file or forwards or backwards from the current cursor position, and whether the search should exactly match the case of the search term.

| To                                                         | Action                                                                                                                                                                                                                                    | See also |

| <b>Replace a text string</b>                                                        | Select the <b>Other   Replace</b> menu option, or press <b>( F6 )</b><br><br>The Replace String Parameters dialog displays, in which you specify: <ul style="list-style-type: none"> <li>• The text string to locate</li> <li>• The text string to replace it with</li> <li>• Whether to search the whole document or a highlighted block of text</li> <li>• Whether to confirm each replacement before making the change</li> </ul> |          |

### 17.1.1.6 Import RTF Template

Enterprise Architect provides a number of RTF document templates, and enables you to create others. However, you might already have corporate formats and templates in use in your organization, so Enterprise Architect also enables you to import existing templates into the RTF Generator.

To import an external template, follow the steps below

#### How To:

| Step | Action                                                                                                                                                                                                                   | See Also                                                                                                                                |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| 1.   | Save the external template as an RTF document                                                                                                                                                                            |                                                                                                                                         |
| 2.   | In Enterprise Architect, <b>create a new blank template</b> . Name the template but do not specify an existing template to copy from.                                                                                    | <a href="#">RTF Templates Tab</a>                  |
| 3.   | When the template is listed on the <b>Templates</b> tab of the <b>Generate RTF Documentation</b> dialog, click on the name and click on the <b>Edit</b> button. The <b>RTF Document Template Editor</b> dialog displays. |                                                                                                                                         |
| 4.   | Select the <b>File   Import</b> menu option. The Microsoft Word file <b>Open</b> dialog displays.                                                                                                                        |                                                                                                                                         |
| 5.   | Locate your template RTF file, and click on the <b>Open</b> button. The <b>Open</b> dialog closes, returning you to the <b>Document Template Editor</b> dialog. This now contains your imported template.                |                                                                                                                                         |
| 6.   | Select the <b>File   Save</b> menu option. If necessary, make any changes to the template and select <b>File   Save</b> again before selecting <b>File   Close</b> to exit the dialog.                                   | <a href="#">RTF Style Template Editor Options</a>  |

#### Notes:

- Standard graphical images (such as a logo in the header, main text or footer) are imported. However, any Word-based meta-file graphics are not imported
- You can select the new template to use in generating an RTF document, either on the **Generate RTF Documentation** dialog or in a **Master Document** or **Model Document** element

**Learn More:**

- [Generate RTF Documentation](#)<sup>[1727]</sup>
- [Master Document](#)<sup>[1776]</sup>
- [Model Document](#)<sup>[1777]</sup>

**17.1.1.7 Resource Documents**

The *Resource Document* feature enables a particular documentation configuration to be 'remembered', linking the loaded template within the **Generate RTF Documentation** dialog to the current highlighted package. If a particular template is always used with a specific package, and multiple cases of documentation exist to be propagated, saving these as Resource Documents can ease document generation later.

To create and use Resource Documents, follow the steps below

**How To:**

| Step | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | See Also                                                 |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| 1.   | Open the <b>Generate RTF Document</b> dialog.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="#">Generate RTF Documents</a> <sup>[1727]</sup> |
| 2.   | Click on the <b>Resource Document</b> button. The <b>Save current as document definition</b> dialog displays                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                          |
| 3.   | In the <b>Enter Value</b> field, type a name for the document and click on the <b>OK</b> button. The document is added to the <b>Resources</b> window for easy future access (as for the <i>usecasedoc</i> entry in the illustration below).                                                                                                                                                                                                                                                                                                                                          |                                                          |
| 4.   | To generate documentation from the <b>Resources</b> window, right-click on the required document. The context menu displays.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                          |
| 5.   | Select the required option.<br>The context menu options are: <ul style="list-style-type: none"> <li>• <b>Open Document</b> - Opens the corresponding .RTF file, as specified by the RTF template Filename property</li> <li>• <b>Generate Document</b> - Opens the <b>Generate RTF Documentation</b> dialog, loaded with the specified template</li> <li>• <b>Auto Generate Document</b> - Generates documentation, with the document located at the path specified by the template's Filename property</li> <li>• <b>Delete Document</b> - Removes the specified document</li> </ul> |                                                          |

| Topic                                    | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | See also |

**Reference:**

The Options tab of the Generate RTF Documentation dialog has the following fields:

| Field                         | Usage                                                                                                                                                                                                                                                                                                                                                             | See also |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| <b>Only include objects</b>   | Filter elements according to date created or modified. In the first two fields, select the qualifiers from the drop-down lists. In the third field, select the appropriate date.                                                                                                                                                                                  |          |
| <b>Where Package Phase</b>    | Filter elements according to the value of the <b>Package Phase</b> field. In the first field select the qualifier, and in the second type the required phase (or leave the default value <b>All</b> ).                                                                                                                                                            |          |
| <b>With element status</b>    | Filter elements according to status. In the first field, select the qualifier ( <b>like</b> , <b>not like</b> , <b>in</b> , <b>not in</b> ) and in the second field type the value to be used. Values should be enclosed in quotes; for example: "Proposed". If you type more than one value, separate them with a comma; for example: "Proposed", "Implemented". |          |
| <b>Connector Direction</b>    | Filter connectors according to direction.<br><br>If you select <b>Both</b> , the connector is documented twice; once for the source element and once for the target. For the remaining two values, the connector is documented only for the source or target element, as appropriate.                                                                             |          |
| <b>Packages by</b>            | Order packages in the generated documentation in either ascending or descending order of Name, Tree Order, Modified Date or Created Date.                                                                                                                                                                                                                         |          |
| <b>Elements by</b>            | Order elements in the generated documentation in either ascending or descending order of Name, Tree Order, Modified Date or Created Date.                                                                                                                                                                                                                         |          |
| <b>Diagrams by</b>            | Order diagrams in the generated documentation in either ascending or descending order of Name, Tree Order, Modified Date or Created Date                                                                                                                                                                                                                          |          |
| <b>Exclude details for</b>    | Exclude all elements of the selected type or types from the generated document                                                                                                                                                                                                                                                                                    |          |
| <b>Exclude connector type</b> | Exclude all connectors of the selected type or types from the generated document                                                                                                                                                                                                                                                                                  |          |

The **Advanced** tab of the **Generate RTF Documentation** dialog has the following fields:

| Field                            | Usage                                                     | See also |

| <b>How to Access</b> | <p>As with the Document Options tabs, you can access the filter details from two different places; the start point affects the persistence of the filter definition.</p> <ul style="list-style-type: none"> <li>If you define the filters on the Element Filters tab of the <b>Generate RTF Documentation</b> dialog, you can create filter settings for the current report to be run. Selections are non-persistent, and are reset when you close the dialog or select a different template.</li> <li>If you access the filter definitions by clicking on the <b>File   Document Options</b> menu option on the <b>RTF Style Template Editor</b> dialog, the settings are saved with the template as the default settings for any run of this report.</li> </ul> <p>You add filters by clicking on the <b>Add Filters</b> button. To edit the filters, either double-click on the panel contents or click on the Edit Filter button, to display the Edit Filters dialog. The format is the element field name, the conditions placed on the field value, any actual value or delimiting value to search on, and whether the filter item is required (mandatory).</p> | <p><a href="#">Generate RTF Documentation</a><sup>[1732]</sup></p> <p><a href="#">File and Print Options</a><sup>[1745]</sup></p> <p><a href="#">RTF Style Template Editor</a><sup>[1736]</sup></p> <p><a href="#">Add Filters</a><sup>[487]</sup></p> |

The fields and options on this dialog are described below.

| Column/Button                                       | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | See also                                               |
|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| <b>Search In</b>                                    | Select the type and name of each element field to search on.                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                        |
| <b>Condition</b>                                    | Select the condition of the search parameter. The available options are <b>Contains</b> , <b>Equal To</b> , <b>Not Equals</b> and <b>One Of</b> .                                                                                                                                                                                                                                                                                                                                                    | <a href="#">Fields and Conditions</a> <sup>[489]</sup> |
| <b>Look For</b>                                     | Specify the search term to perform the conditional search on. This value can pertain to the selected element field. For example, the value could be a date for <i>DateCreated</i> or a text value for other fields. The search term can contain multiple values, separated by commas.                                                                                                                                                                                                                | <a href="#">Fields and Conditions</a> <sup>[489]</sup> |
| <b>Required</b>                                     | <p>Indicate that the search results must include elements with your search term in that field. You select these checkboxes on the Add Filters dialog</p> <p>The fields listed as filters have an OR relationship when no <b>Required</b> checkboxes are selected; that is, if the search term is found in any one of those fields, then the element is displayed.</p> <p>Any field having the <b>Required</b> checkbox ticked overrides fields where the <b>Required</b> checkbox is not ticked.</p> | <a href="#">Adding Filters</a> <sup>[487]</sup>        |
| <b>Element Features</b><br>- Optional<br>- Required | <p>Specify whether element features are optional or required. These appear as a new branch underneath the root element term in the <b>Search In</b> column.</p> <p>If you scroll down the <b>Search In</b> column, you see sub-branches such as <i>Attribute</i>, <i>Change</i> and <i>Custom Property</i>. These are the element features.</p>                                                                                                                                                      |                                                        |

| Column/Button        | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | See also                                        |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------|
|                      | <p>You can add these features by clicking on the <b>Add Filter</b> button. The <b>Add Filters</b> dialog displays, with a list of all the filters you can choose for an element or element feature. Click on the <b>Search On</b> drop-down arrow to see a list of the element features you can search on. Each feature has its own set of filters such as <i>Name</i>, <i>Notes</i> and <i>Alias</i>, which you can add to your search. To search on an element attribute name, you would add the <i>Attribute</i> feature with a <i>Name</i> filter to your search.</p> <p>The <b>Optional</b> radio button enables you to generate a list of elements that meet <i>one</i> of the element features (<i>Element Type = Object</i>), or one of the feature filters (<i>Attribute Name = Class1</i>). For example, if your search is:</p> <p><i>Element Name = Class11, Attribute Name = m_At1 or Scope = Public</i></p> <p>the search results would list all the elements that have the <i>name</i> of <i>Class11</i> and all the elements that have an <i>Attribute Name</i> of <i>m_At1</i> or a <i>Scope</i> of <i>Public</i>.</p> <p>The <b>Required</b> radio button enables you to generate a list of elements that <i>must</i> have the element features you have added. For example, if your search is:</p> <p><i>Element Name = Class, Attribute Name = m_At1 or Scope = Public</i></p> <p>you would get elements that <i>must</i> have the <i>name</i> of <i>Class</i> AND an <i>Attribute</i> with a name of <i>m_att1</i> or a <i>Scope</i> of <i>Public</i>.</p> |                                                 |
| <b>Add Filter</b>    | Add a new set of parameters to filter the search on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <a href="#">Adding Filters</a> <sup>[487]</sup> |
| <b>Edit Filter</b>   | Open the <b>Edit Filters</b> dialog, which enables you to change the search parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                 |

### 17.1.1.10 Other Filters

The **Other Filters** tab enables you to define a set of filters to restrict your report to specific features of elements (sub-element components such as attributes, responsibilities or constraints). If the feature does not have the defined characteristics, it is not reported for the element.

#### Topics:

| Topic                | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | See also                                                                                                                                                                      |

| <b>Search In</b>     | Select the name of each feature field to search on.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                        |
| <b>Condition</b>     | Select the condition of the search parameter. The available options are <b>Contains</b> , <b>Equal To</b> , <b>Not Equals</b> and <b>One Of</b> .                                                                                                                                                                                                                                                                                                                                                     | <a href="#">Fields and Conditions</a> <sup>[489]</sup> |
| <b>Look For</b>      | Specify the search term to perform the conditional search on. This value can pertain to the selected field. For example, the value could be a date for <i>DateCreated</i> or a text value for other fields. The search term can contain multiple values, separated by commas.                                                                                                                                                                                                                         | <a href="#">Fields and Conditions</a> <sup>[489]</sup> |
| <b>Required</b>      | <p>Indicate that the search results must include elements with your search term in that field. You select these checkboxes on the Add Filters dialog.</p> <p>The fields listed as filters have an OR relationship when no <b>Required</b> checkboxes are selected; that is, if the search term is found in any one of those fields, then the element is displayed.</p> <p>Any field having the <b>Required</b> checkbox ticked overrides fields where the <b>Required</b> checkbox is not ticked.</p> | <a href="#">Adding Filters</a> <sup>[487]</sup>        |
| <b>Add Filter</b>    | Add a new set of parameters to filter the search on.                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <a href="#">Adding Filters</a> <sup>[487]</sup>        |
| <b>Edit Filter</b>   | Open the <b>Edit Filters</b> dialog, which enables you to change the search parameters.                                                                                                                                                                                                                                                                                                                                                                                                               |                                                        |
| <b>Remove Filter</b> | Remove the selected filter from the search.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                        |

### 17.1.1.11 Project Constants

The **Project Constants** tab enables you to add values for your own project-specific fields in a report, to be inserted during compilation. The fields can be inserted into any template, in the text, headers or page headers and footers, using the RTF Style Template Editor **context menu**.

| Field      | Usage                                                                            | See also |
|------------|----------------------------------------------------------------------------------|----------|
| <b>Add</b> | Add a new field and value to the list. A prompt displays for the two data items. |          |

| Field  | Usage                                                                                                        | See also |
|--------|--------------------------------------------------------------------------------------------------------------|----------|
| Delete | Remove the selected field from the list. A prompt displays to confirm the deletion.                          |          |
| Import | Import a set of fields from an external XML file. A browser displays to select the source file and location. |          |
| Export | Export all fields to an external XML file. A browser displays to specify the target file and location.       |          |

### 17.1.1.12 Word Substitution

The **Word Substitution** tab of the **Generate RTF Documentation** dialog enables you to define translations of technical terms used in Enterprise Architect, in particular field names, into a language other than English for direct substitution into RTF documentation.

To add a translation for a term, follow the steps below:

How To:

| Step | Action                                                                                                                             | See Also |
|------|------------------------------------------------------------------------------------------------------------------------------------|----------|
| 1.   | Double-click on the term in the <b>English</b> column in the <b>Word Substitution</b> List; the <b>Enter Value</b> field displays. |          |
| 2.   | Type the foreign language translation in the <b>Enter Value</b> field, and click on the <b>OK</b> button.                          |          |

### 17.1.1.13 Language Substitution

The **Codepage** tab of the **Generate RTF Documentation** dialog enables you to define languages other than English for direct substitution into RTF documentation.

If you export RTF-format documents from Enterprise Architect in languages other than English, you can customize the codepage, default language ID and character set that Enterprise Architect uses when generating RTF. This makes it much easier to generate documentation appropriate to your country or locale.

How To:

| Step | Action                                                                                                                                                                              | See Also |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 1.   | From the drop-down lists in the <b>Language</b> , <b>Codepage</b> and <b>Charset</b> fields, select the language, codepage and character set that most closely match your location. |          |
| 2.   | If required, modify the <b>Substitute Tag</b> by double-clicking on each and manually setting the value (for advanced use only).                                                    |          |
| 3.   | To clear the substitution list, double-click on each item in turn and delete                                                                                                        |          |

| Step | Action                | See Also |
|------|-----------------------|----------|
|      | the substitute value. |          |

Now when you generate RTF documents, the substitute tags are used in the output.

**Notes:**

- You can transport these tag definitions between models, using the **Export Reference Data** and **Import Reference Data** options on the Project | Model Import/Export menu

## 17.1.2 Virtual Documents

*Virtual documents* enable you to structure and filter your **RTF** and **HTML** reports by selecting, grouping and ordering individual packages independent of the organization of the Project Browser.

**Topics:**

| Topic           | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | See also                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Abstract</b> | <p>You can create separate virtual documents defining, say, Requirements, Use Cases or Design elements of a project, or you can combine these separate reports - retaining their own different formats - into a single generated document with common headers and footers and a central contents list. This combined document could apply your corporate standards. You generate virtual documents in Enterprise Architect from individual <b>Model Document</b> elements. You can also, if required, combine several Model Documents under a <b>Master Document</b> package element. You can create as many Model Documents as required, for as many combinations of information as required.</p> <p>Each Model Document element has its own template; for example, a specifically-designed Requirements template for a Requirements document, or a Use Case template for a section on Use Cases. For HTML, the template is identified on the report generation dialog. For RTF, the template is identified in a Tagged Value.</p> <p>The content of the report is defined as either:</p> <ul style="list-style-type: none"> <li>A list of packages (defined as attributes) dragged onto the element in whatever order or combination is most appropriate to your requirements - you can easily <b>add</b> or <b>delete</b> packages as necessary; or</li> <li>(Not for HTML reports) a standard model search (defined as Tagged Values) created within the Model Search facility - note that diagram searches are not supported; when you generate the document, this search captures the required data throughout the model, and populates the document.</li> </ul> | <p><a href="#">Creating a Model Document</a><sup>[1777]</sup></p> <p><a href="#">Create a Master Document</a><sup>[1778]</sup></p> <p><a href="#">Add packages to your Document Object</a><sup>[1778]</sup></p> <p><a href="#">Deleting packages from a model document</a><sup>[1779]</sup></p> <p><a href="#">Create and Modify Searches</a><sup>[482]</sup></p> <p><a href="#">Import RTF Templates</a><sup>[1765]</sup></p> <p><a href="#">Document Order</a><sup>[1780]</sup></p> |

| Topic                           | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | See also                                                 |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|                                 | <p>The Master Document element has its own template Tagged Value, which defines the headers, footers and central contents list. You can <b>import your corporate standards template</b> and edit the Tagged Value to identify that. The template in the Master Document overrides the templates in the Model Documents. For example, headers and footers in the Master Document template override any header and footer definitions in the Model Document templates. This enables you to apply consistent and continuous styles and page numbering throughout the report generated through the Master Document. If you want the Model Documents to have their own styles, applied through their own RTFTemplate Tagged Values, either leave the Master Document RTFTemplate Tagged Value blank (for completely separate overall styles) or remove the definition of specific styles from the Master Document template.</p> <p>You can control the sequence in which information is presented in the document; see the <i>Document Order</i> topic.</p> |                                                          |
| <p><b>Document Elements</b></p> | <p>The Master Document and Model Document elements are available from the Documentation page of the Toolbox; on the Toolbox, select <b>More tools   Documentation</b>. (This Toolbox page also provides the <b>Document Artifact</b> element, which is not related to virtual documents but is used for adding a linked document to an element.)</p>  <p>When you drag the Master Document and Model Document elements onto a diagram, the following symbols display, respectively:</p> <div style="display: flex; justify-content: space-around;">   </div>                                                                                                                                                                                                                                 | <p><a href="#">Document Artifact</a> <sup>[95]</sup></p> |

**Notes:**

- In a Model Document for an RTF report, you should not define both a list of packages and a search; if both are present, when you generate the RTF document Enterprise Architect works from the package list only
- You cannot use **RTF Bookmarking** in Master Document elements, which effectively replace RTF Bookmarking in Word.

RTF Bookmarking requires each bookmark to be unique. When you generate a report with a standard RTF template (including in a single Model Document element), each bookmark is unique and there is a 1:1 association between the Elements-details being generated and the elements in the repository. As Master Documents are intended to contain multiple sub-documents, the association ceases to be 1:1. There is no simple method that enables the generated data to be uniquely identified directly in association with the original element

**17.1.2.1 Create Master Document**

Whilst you can create Model Document elements separately and generate individual documents from each one, you have added flexibility and scope if you organize Model Documents under a Master Document. You can generate a document with a **corporate template** for the covers, contents, headers and footers, whilst each section (generated from a separate Model Document) has its own appearance defined by a template appropriate to the section content.

**How To:**

To create a Master Document element, follow the steps below:

| Step | Action                                                                                                                                                                                                                                                                                                                                                                | See Also                                                |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| 1    | Open or create the diagram in which to create the Master Document                                                                                                                                                                                                                                                                                                     |                                                         |
| 2    | In the Toolbox, select <b>More tools   Documentation</b>                                                                                                                                                                                                                                                                                                              |                                                         |
| 3    | Drag the <i>Master Document</i> icon onto the diagram<br>The system prompts you for the name of the Master Document                                                                                                                                                                                                                                                   |                                                         |
| 4    | Type the element name and click on the <b>OK</b> button<br>The system creates the Master Document element and a child Custom diagram of the same name                                                                                                                                                                                                                 |                                                         |
| 5    | If creating a Master Document for an HTML report, go to step 7<br><br>Otherwise, open the Tagged Values window ( <b>View   Tagged Values</b> ) and click on the Master Document element<br><br>The <i>RTFTemplate</i> Tagged Value displays in the window. This Tagged Value is filled with the valid template names                                                  |                                                         |
| 6    | The RTFTemplate Tagged Value defaults to ( <i>model document: master template</i> )<br><br>If you want to use an alternative master template, click on the drop down arrow at the right of the field and click on that template in the list                                                                                                                           |                                                         |
| 7    | Return to the Project Browser and open the Master Document child diagram<br><br>At this point, you <b>create the Model Document</b> elements in the child diagram, to provide the content for the generated document<br><br>When you have added all your Model Document elements to the Master Document diagram, the Master Document element resembles the following: | <a href="#">Create Model Document</a> <sup>[1777]</sup> |

| Step | Action                                                                                                                                                                                                                                                                             | See Also |

### 17.1.2.2 Create Model Document

You can create as many Model Document elements as are necessary to provide the sections of your generated document (under a Master Document) or to provide the independent documents you require.

**How To:**

To create a Model Document element, follow the steps below:

| Step | Action                                                                                                                                                                                                                                                                                                                                                                                                       | See Also                                                 |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| 1    | <p>Open the Master Document child diagram or (if you are creating independent Model Documents) create a new diagram</p> <p>The new diagram can live anywhere outside the packages you are adding to the document; you could create a Class diagram called Documentation within a specific Documentation package, and use this to hold the independent Model Document elements for your virtual documents</p> | <a href="#">Create Master Document</a> <sup>[1776]</sup> |
| 2    | <p>From the Documentation page of the Toolbox (<b>More tools   Documentation</b>) drag the <i>Model Document</i> icon onto the diagram to create a new Model Document element</p> <p>Give the element an appropriate name: for example, if the documentation is relevant to the shopping cart requirements of a model, you could call it <i>ShoppingCartReqDocumentation</i></p>                             |                                                          |

| Step | Action                                                                                                                                                                                                                                                                                                                                                         | See Also                                                         |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|
|      | Click on the <b>OK</b> button                                                                                                                                                                                                                                                                                                                                  |                                                                  |
| 3    | <p>If you are creating a Model Document element for an HTML report, go now to the <i>Add Packages to Model Document</i> topic</p> <p>Otherwise, open the Tagged Values window (<b>View   Tagged Values</b>) and click on the Model Document element</p> <p>The RTFTemplate, SearchName and SearchValue Tagged Values display in the window</p>                 | <a href="#">Add Packages to Model Document</a> <sup>[1778]</sup> |
| 4    | Click on the drop-down arrow to the right of the <b>RTFTemplate</b> field, and click on the template to use for this Model Document                                                                                                                                                                                                                            |                                                                  |
| 5    | <p>If you are creating a list of packages for the Model Document, go now to the <i>Add Packages to Model Document</i> topic</p> <p>Otherwise, click on the drop-down arrow to the right of the <b>SearchName</b> field, and click on the model search type to populate this Model Document</p>                                                                 | <a href="#">Add Packages to Model Document</a> <sup>[1778]</sup> |
| 6    | If necessary, type a search term in the <b>SearchValue</b> field                                                                                                                                                                                                                                                                                               |                                                                  |
| 7    | <p>Create further Model Document elements as required.</p> <p>Your Model Document element appears in the Project Browser with a Class icon, as shown below:</p>  <p>When you have created all the required Model Document elements, see the <i>Document Order</i> topic</p> | <a href="#">Document Order</a> <sup>[1780]</sup>                 |

**Notes:**

- Diagram Searches are not supported
- Custom SQL searches are supported if they are returning elements; the SQL must include *ea\_guid* AS *CLASSGUID* and the *object type*

**17.1.2.3 Add Packages to Model Document****How To:**

To add packages to your Model Document element, follow the steps below

(As the example Model Document element here is called *ShoppingCartDocumentation*, the steps indicate how to add shopping cart-related packages to the element.)

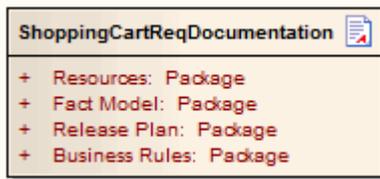

| Step | Action                                                                                                                                                                                                                                                                                                         | See Also                                                                                                                                                                                                                                                                          |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Keeping the documentation diagram open, find a package in the Project Browser to add to the documentation; for example, a Resources package in a Dynamic view                                                                                                                                                  |                                                                                                                                                                                                                                                                                   |
| 2    | <p>Drag and drop the package from the Project Browser onto the Model Document element, as shown below:</p>                                                                                                                   |                                                                                                                                                                                                                                                                                   |
| 3    | <p>The title of the package displays in the Model Document element in the <i>Attributes</i> compartment, as shown below:</p>  <p>This means that the Resources package is included in the document when you generate it</p> |                                                                                                                                                                                                                                                                                   |
| 4    | <p>Using the above method, you can add as many packages from as many different views as required</p> <p>The next step is to generate your document in RTF or HTML, but consider the impact of your package list on the Document Order; you can also delete packages if required</p>                            | <p><a href="#">Generating RTF Documents</a><sup>[1782]</sup></p> <p><a href="#">Generating a Master Document - HTML</a><sup>[1814]</sup></p> <p><a href="#">Document Order</a><sup>[1780]</sup></p> <p><a href="#">Delete Packages from a Model Document</a><sup>[1779]</sup></p> |

#### 17.1.2.4 Delete Package in Model Document

You can delete a package from your Model Document element.

This example includes four packages:

- Resources Package
- Activity Diagram Package
- View Cart Package
- Sequence Diagram Package

**How To:**

To delete a package from a Model Document element, follow the steps below:

| Step | Action                                                                                           | See Also |
|------|--------------------------------------------------------------------------------------------------|----------|
| 1    | In the Project Browser, expand the element to list the package attributes                        |          |
| 2    | Right-click on the package to delete, and select the <b>Delete Attribute</b> context menu option |          |

Alternatively:

| Step | Action                                                                                                                                                                         | See Also |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 1    | In either the Project Browser or the diagram, right-click on the Model Document element and select the <b>Attributes</b> context menu option<br>The Attributes dialog displays |          |
| 2    | On the <b>Attributes</b> list, click on the package to delete                                                                                                                  |          |
| 3    | Click on the <b>Delete</b> button to remove the package from the document element                                                                                              |          |

**17.1.2.5 Document Order**

The order in which information is compiled into a document depends on:

- The sequence of Model Document elements in a Master Document element
- Whether you define a Model Search in a Model Document element (not for HTML reports)
- Whether you define a package list in a Model Document element

When you have considered and, if necessary, amended the order in which information is compiled, you can generate the document in RTF or HTML.

**Topics:**

| Topic                          | Detail                                                                                                                                                                                                                | See also |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| <b>Model Document Sequence</b> | When you generate a document from a Master Document element, the sequence in which the sections are generated is determined by the order in which the child Model Document elements are listed in the Project Browser |          |

| Topic                | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                   | See also |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|                      | <p>You can create elements anywhere in a diagram, therefore the generator refers to the Project Browser sequence</p> <p>If necessary, change the sequence using the green Up and Down arrows in the Project Browser toolbar to move an element up or down within the package</p>                                                                                                                                                                         |          |
| <b>Model Search</b>  | <p>A Model Search operates on the database, and accesses records in the order in which they are stored; this order depends on many factors, and can change with database maintenance</p> <p>Therefore, the sequence of information provided by the search is unpredictable</p>                                                                                                                                                                           |          |
| <b>Package Order</b> | <p>When you create a package list in a Model Document element, the sequence of information is determined by the order in which the package attributes are listed within the element</p> <p>You can change the sequence using the Attributes dialog, and if you prefer a package to be in a different section of the document, you can move the attribute from one Model Document element to another</p> <p>Both these procedures are described below</p> |          |

### How To:

To change the sequence of Packages in a Model Document element, refer to the example element and follow the steps below:

| Images                                                                              | Step | Action                                                                                                                                                                                  | See Also |
|-------------------------------------------------------------------------------------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|  | 1    | <p>Right-click on the Model Document and select the <b>Attributes</b> option from the context menu</p> <p>The Attributes dialog displays</p>                                            |          |
|                                                                                     | 2    | <p>On the <b>Attributes</b> list, click on a package to move and click on the Up or Down (hand) buttons to change the order in which the packages are included in the documentation</p> |          |
|                                                                                     | 3    | <p>When you are satisfied with the order of your packages, click on the <b>Close</b> button</p>                                                                                         |          |

To move a package attribute from one Model Document to another, follow the steps below

| Step | Action                                                                                                                      | See Also |
|------|-----------------------------------------------------------------------------------------------------------------------------|----------|
| 1    | <p>Expand the Model Document elements in the Project Browser, so that both list their package attributes</p>                |          |
| 2    | <p>Click-and-hold on the attribute to move, and drag it onto the name of the target Model Document element</p>              |          |
| 3    | <p>Release the mouse button</p> <p>The attribute is removed from the source element and added to the top of the list of</p> |          |

| Step | Action                                                                                                                       | See Also |
|------|------------------------------------------------------------------------------------------------------------------------------|----------|
|      | attributes in the target element                                                                                             |          |
| 4    | If necessary, move the attribute down the attribute list, as described in <i>Change Sequence of Packages in List</i> , above |          |

### 17.1.2.6 Section Numbering in Virtual Documents

Virtual documents can contain several sections based on separate templates. To ensure that section and subsection numbering continues sequentially through the sections, you can either use:

- The *MasterList* style from the **Normal.rtf** file (which is the default applied to all new templates, such as those used in each Master Document and Model Document element); this provides a simple but consistent list numbering style that you can start off with. Alternatively, use:
- Your own numbering style

If you design your own styles in the template used in each model document, each template must use the same **List Overrides** for section numbering. These have a unique ID, so to propagate the List Overrides across multiple templates, you must:

| Step | Action                                                                                                                                                                                      | See Also                                                 |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| 1    | Set up the common List Overrides in the <i>Normal.rtf</i> template (your own customized override list)                                                                                      |                                                          |
| 2    | Within each of the other templates used in the virtual document, using the template editor, select <b>File   Update Styles</b> to update the templates to include the common List Overrides | <a href="#">File and Print Options</a> <sup>[1745]</sup> |
| 3    | In each template use this common List Level for progressive numbering throughout the virtual document                                                                                       |                                                          |

### 17.1.2.7 Generate the Document (RTF)

**How To:**

To generate the documentation defined in the Master Document and/or Model Documents, follow the steps below

| Step | Action                                                                                                           | See Also |
|------|------------------------------------------------------------------------------------------------------------------|----------|
| 1    | On the documentation diagram, click on the Master Document element (or on an independent Model Document element) |          |

| Step | Action                                                                                                                                                             | See Also                                                            |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------|
| 2    | Select the <b>Element   Advanced   Rich Text Format ( RTF) Report</b> menu option<br>The Generate RTF Documentation dialog displays                                |                                                                     |
| 3    | Set the options for your RTF document as required<br>See the <i>Generate RTF Documentation Dialog</i> and related topics for further information on these settings | <a href="#">Generate RTF Documentation Dialog</a> <sup>[1732]</sup> |
| 4    | Click on the <b>Generate</b> button to create the documentation                                                                                                    |                                                                     |
| 5    | If you have not selected the <b>View Document on Completion</b> checkbox, click on the <b>View</b> button to view the documentation                                |                                                                     |

The RTF Report Generator works through the defined content of the Master Document element and/or the Model Document elements and pulls in the information from either the listed packages or the executed searches, formatted according to the templates identified in the *RTFTemplate* Tagged Value for each document element.

### 17.1.3 Other Documents

Enterprise Architect has other RTF based documentation that you can output:

| Topic                                                                                                                                                                                              | Link                                                     |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Dependency Report</b> - shows a list of any elements that are dependent (in a Dependency connector) on another element for their specification                                                  | <a href="#">Dependency Report</a> <sup>[1783]</sup>      |
| <b>Diagrams Only Report</b> - lists only the relevant diagrams from the target package                                                                                                             | <a href="#">Diagrams Only Report</a> <sup>[1784]</sup>   |
| <b>Implementation Report</b> - lists, for a specified package, the elements that require implementers, together with any source elements in Realize (Implements) relationships with those elements | <a href="#">Implementation Report</a> <sup>[1785]</sup>  |
| <b>Resource Report</b> - shows how your resources are deployed in your project, displaying a list of all elements that have resources allocated to them                                            | <a href="#">Resource Report</a> <sup>[370]</sup>         |
| <b>Testing Report</b> -                                                                                                                                                                            | <a href="#">Testing Report</a> <sup>[1786]</sup>         |
| <b>Testing Details Report</b> - enables you to review the testing details for a package, as filtered reports on all elements in the package hierarchy under the selected package                   | <a href="#">Testing Details Report</a> <sup>[1786]</sup> |

#### 17.1.3.1 Dependency Report

A Dependency report shows a list of any elements in the package (selected from the Project Browser) that are dependent on another element for their specification.

For example, a Use Case derives its specification from the Requirement that it realizes.

Each of the elements in the first column of the report is the source or dependent in a Dependency connector to the corresponding target element in the **Dependent on** column.

**Access:** [Project | Documentation | Dependency Details](#)

**How to:**

On the Dependency Details dialog, run the report and make selections from the options as indicated below:

| Field                | Usage                                                                                                                                                                                                                                | See also                            |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------|
| <b>Root Package</b>  | Confirm the root package; all elements and packages under this package appear in the report<br><br>If you want to change the package, click on the replacement package in the Project Browser and click on the <b>Refresh</b> button |                                     |
| <b>Refresh</b>       | Run the report                                                                                                                                                                                                                       |                                     |
| <b>Locate Object</b> | Locate the selected element in the Project Browser                                                                                                                                                                                   |                                     |
| <b>Print</b>         | Print the list                                                                                                                                                                                                                       |                                     |
| <b>Save Report</b>   | Display a small dialog in which you specify the file location into which to save the report as an RTF file                                                                                                                           |                                     |
| <b>Details</b>       | List dependency details; lists the elements in the current package and the elements that they are dependent on                                                                                                                       | <a href="#">Dependency</a><br>[979] |

### 17.1.3.2 Diagrams Only Report

You can also produce an RTF report that contains only the relevant diagrams from the target package. This is convenient for printing or handling a lot of diagrams in batch, rather than exporting or printing each one at a time.

**Access:** [Project Browser package context menu](#) | [Documentation](#) | [Diagrams Only Report](#)

**How To:**

To produce a Diagrams Only report, follow the steps below:

| Step | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | See Also |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 1    | On the Export Diagrams to RTF Document dialog, in the <b>Output Path</b> field, type or browse for the output location to create the report in                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |          |
| 2    | Select the options you require, as follows: <ul style="list-style-type: none"> <li>• Select the <b>Embed Diagrams in Document</b> checkbox to ensure the diagrams are created within the RTF file, not as linked image files</li> <li>• Select the <b>Include all child packages</b> checkbox to document all of the diagrams included in any child package</li> <li>• Select the <b>Include Diagram Name</b> checkbox to include the diagram name within the generated documentation</li> <li>• Select the <b>Order Diagrams Alphabetically</b> checkbox to generate the documentation in alphabetical order</li> </ul> |          |
| 3    | Click on the <b>Generate</b> button to run the report                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |          |
| 4    | When the report is generated, click on the <b>View</b> button to show the RTF output                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |          |

### 17.1.3.3 Implementation Report

An *Implementation report* shows a list of the elements in the package (selected in the Project Browser) that require implementers, together with any source elements in Realize (Implements) relationships with those elements.

**Access:** [Project](#) | [Documentation](#) | [Implementation Details](#)

#### How to:

On the Implementation Details dialog, make selections from the options as indicated below, and run the report:

| Field                     | Usage                                                                                                                                                                                                                                                          | See also                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| <b>Root Package</b>       | Confirm the root package; all elements and packages under this package appear in the report<br><br>If you want to report on a different package, click on that package in the Project Browser                                                                  |                                                                 |
| <b>Set Target Types</b>   | By default Enterprise Architect only reports on a limited number of element types, such as Use Cases and Requirements; you can expand the range of element types to include<br><br>Set the list of types to report on, using the Implementation Targets dialog | <a href="#">Implementation Targets Dialog</a> <sup>[1785]</sup> |
| <b>Refresh List</b>       | Run the report and display the results                                                                                                                                                                                                                         |                                                                 |
| <b>Locate Object</b>      | Locate the selected element in the Project Browser                                                                                                                                                                                                             |                                                                 |
| <b>Show Unimplemented</b> | Show non-implemented elements<br><br>Non-implemented elements are those that don't have any other element to realize them (for example, a Use Case that has no Component or Class to implement the Use Case behavior)                                          |                                                                 |
| <b>Show Implemented</b>   | Show implemented elements<br><br>These are elements that do have some element associated with them in a Realize relationship (for example a Use Case that has a Component that implements it)                                                                  | <a href="#">Realize</a> <sup>[1007]</sup>                       |
| <b>Details</b>            | List elements in the current package hierarchy and elements that implement them                                                                                                                                                                                |                                                                 |
| <b>Print</b>              | Print the list                                                                                                                                                                                                                                                 |                                                                 |
| <b>Save Report</b>        | Specify the file location into which to save the report as an RTF file                                                                                                                                                                                         |                                                                 |

#### 17.1.3.3.1 Implementation Targets Dialog

The Implementation Targets dialog is accessed by clicking on the **Set Target Types** button on the Implementation Details dialog.

This dialog enables you to set the types of elements that appear in the report as requiring implementation.

Double-click on an element in either list to move it to the other list.

### 17.1.3.4 Testing Report

**Access:** [Project | Documentation | Testing Report](#)

**How To:**

To view a Testing report, follow the steps below:

| Step | Action                                                                                                                      | See Also |
|------|-----------------------------------------------------------------------------------------------------------------------------|----------|
| 1    | In the Project Browser, click on the package to report on<br>The package name displays in the <b>Root Package</b> field     |          |
| 2    | In the Report on panel, select the check box against each type of test to include in the report                             |          |
| 3    | If you intend to report on tests on elements in the subordinate packages, select the <b>Include child packages</b> checkbox |          |
| 4    | In the Output file field, type in or browse for the file path of the report output file                                     |          |
| 5    | Click on the <b>Generate</b> button to output the report, and open it at the specified file location                        |          |

### 17.1.3.5 Testing Details Report

The Testing Details report enables you to review the testing details for a package, running filtered reports on all elements in the package hierarchy under the selected package.

**Access:** [Project | Documentation | Testing Details](#)

**Use to:**

- Show the testing details for the elements in a package, for tests that meet specific criteria

**How to:**

On the Testing tab, make selections from the options as indicated below, and run the report:

| Field             | Usage                                                                                                     | See also |
|-------------------|-----------------------------------------------------------------------------------------------------------|----------|
| <b>Run By</b>     | Select a name to filter for tests run by that person; click on the <b>x</b> button to clear the field     |          |
| <b>Checked By</b> | Select a name to filter for tests checked by that person. Click on the <b>x</b> button to clear the field |          |
| <b>Test Type</b>  | Select the radio button for the required test type                                                        |          |
| <b>Status</b>     | Select the radio button for the required test status                                                      |          |

### 17.1.4 The Legacy RTF Report Generator

**Topics:**

| Topic           | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | See also |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| <b>Abstract</b> | <p>Creating a <b>Rich Text Format</b> (RTF) document is a simple and flexible process. An RTF document is based on a package or an element in your project (more usually a package). To produce a document, you select the package or element to report on in the <b>Project Browser</b>, <b>Package Browser</b>, <b>Diagram List</b> or <b>Model Search</b>, then press ( <b>F8</b> ) to display the <b>Generate RTF Documentation</b> dialog. On the <b>Advanced</b> tab, click on the <b>Switch generator</b> button to access the Legacy <b>Rich Text Format Report</b> dialog.</p> <p>The <b>Rich Text Format Report</b> dialog enables you to set the exact contents and look and feel of your report. You enter the file name of the report, a heading, additional notes, template name (for saving the set-up) and other options. You can also select the style of the report; either plain or formal.</p> <p>Optionally, you can set up a filter, the details to include, element types to exclude, whether to process child packages, whether to show diagrams and the diagram format.</p> <p>You can switch back to the <b>Generate RTF Documentation</b> dialog by clicking on the <b>Switch RTF Generator</b> button.</p> |          |

**Notes:**

- The Legacy Generator is available if you have RTF templates created in releases of Enterprise Architect prior to 4.1, and you prefer to generate RTF reports using the original generator. However, as you can generate reports from these templates using the post-Enterprise Architect 4.1 RTF Generator, the Legacy Generator and instructions for its use are no longer updated. However, reports produced using the Legacy RTF Generator do reflect the Notes formatting feature in any text associated with elements
- The **Rich Text Format Report** dialog panels are individually described in the subsequent topics of this section (listed below). The dialog has a lot of options; get to know them all to produce output at the level of detail suited to your project

**17.1.4.1 Document a Single Element**

RTF documentation can also be generated for a single element.

**Access:** **Select an element and then go to: Element | Advanced | Rich Text Format (RTF) Report**

Click on the **Switch Generator** button to display the **Rich Text Format Report** dialog. See The **Legacy RTF Report Generator** and its related topics for further information.

**Learn More:**

- [The Legacy RTF Report Generator](#)<sup>[1787]</sup>

**17.1.4.2 Set the Main RTF Properties**

The main section of the **Rich Text Format Report** dialog enables you to set the output location and appearance of the final RTF document.

**How To:**

| Step | Action                                                                                                                | See Also                                                          |
|------|-----------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| 1.   | Open the <b>Rich Text Format Report</b> dialog (see The <b>Legacy RTF Report Generator</b> topic for how to do this). | <a href="#">The Legacy RTF Report Generator</a> <sup>[1787]</sup> |
| 2.   | Supply an <b>Output Filename</b> to save the report into; always include the extension .RTF as part of the filename.  |                                                                   |
| 3.   | Provide a <b>Template Name</b> to save this report set-up.                                                            |                                                                   |
| 4.   | Select a report <b>Style</b> : Formal or Basic.                                                                       |                                                                   |
| 5.   | Type a <b>Heading</b> for your report; this appears as the first heading item in your output.                         |                                                                   |

| Step | Action                                                                                               | See Also |
|------|------------------------------------------------------------------------------------------------------|----------|
| 6.   | Select your required <b>Heading Style and Initial Heading Level Indent</b> from the drop-down lists. |          |

**Notes:**

- It is recommended that you enter a full path name for your report. The images in your report are saved externally in an images directory, and supplying the full directory path avoids confusion over the location of these images. Also, if you move your report you must also move the images directory

**17.1.4.3 Apply a Filter****Topics:**

| Topic | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | See also |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| Usage | <p>You can apply a filter on the <b>Rich Text Format Report</b> dialog to include or exclude elements by date modified, phase or status. This helps to track changes and break a document into multiple delivery phases.</p> <p>Open the <b>Rich Text Format Report</b> dialog (see <b>The Legacy RTF Report Generator</b> for how to do this).</p> <ul style="list-style-type: none"> <li>• To enable the date filter, select the checkbox in the date field.</li> <li>• In the first two <b>Only include objects</b> fields, click on the drop-down arrows and select the appropriate criteria (<b>Modified/ Created, Before/After</b>).</li> <li>• The package phase filter applies at the package level (not the element level) and ignores the phase of the root package that you are documenting. To enable the phase filter, in the <b>Where Package Phase</b> field click on the drop-down arrow and select an operator; Enterprise Architect filters out all packages that do not meet the selection criteria. All elements in the package are ignored, regardless of their individual phase.</li> <li>• The element status filter enables you to limit the output by element status. Unlike the package phase filter, this filter applies to every element. You can filter against a status of like or <i>unlike</i> a criterion, for example, <i>like proposed</i>, or against the <i>in</i> and <i>not in</i> operators, such as <i>in approved</i>, <i>not in validated</i>. When using the <i>in</i> and <i>not in</i> operators, enter a comma-separated list of status types as your criteria expression</li> </ul> |          |

|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| Usage | <p>What you include or exclude governs how simple or detailed your report is. You can create multiple reports at different levels of detail for different audiences. Experiment with these options to see what effect inclusion or exclusion has. Most items are self-explanatory.</p> <p>Selecting the checkbox against a category item in the list selects all of the options that are contained in the category. To expand a category, click on the +symbol next to the category name. To exercise greater control over a category of options expand the top level item and then select the required individual items from the list.</p> <p>Sometimes an item applies only to a certain type of element; for example, <b>Attributes</b> only applies to Class elements and a few other element types. The <b>Child Diagrams</b> option shows or hides any diagrams that are attached under a model element; for example, a Use Case might have a Scenario diagram attached.</p> |          |

**Notes:**

- Use this feature to produce the right level of detail for your audience. Technical readers might want to see everything, whilst management might require only the general outline

**17.1.4.9 Generate the Report****Topics:**

| Topic        | Detail                                                                                                                                                                                                                            | See also |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| <b>Usage</b> | Once you have set up the document properties as required, click on the <b>Generate</b> button to generate the report.<br><br>When you have generated the document, click on the <b>View</b> button to open the report in MS Word. |          |

**17.1.4.10 Legacy RTF Style Templates**

The **Legacy RTF Style Editor** enables you to edit the RTF associated with various sections of the RTF Report facility in Enterprise Architect. You would typically use this functionality to customize a report's look and feel for your company or client.

If you have previously defined and saved a template, click on the **Load** button on the **Rich Text Format Report dialog** to open the list of defined templates. Select one in order to load it as the current template; all the features saved become the current features. This enables you to define a set of standard report types that streamline document production.

**Access:** [View | More Project Tools | Project Resources | Resources](#)

To create or Edit RTF Style Templates, follow the steps below

**How To:**

| Step | Action                                                                                                                                                                                                                                              | See Also |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 1.   | Select the <b>View   More Project Tools   Project Resources</b> menu option to display the <b>Resources</b> window.                                                                                                                                 |          |
| 2.   | Expand the <b>Templates</b> folder                                                                                                                                                                                                                  |          |
| 3.   | To edit an <i>existing</i> Legacy template, expand the <b>Legacy Templates</b> tree and double-click on the template name, or right-click and select the <b>Modify Document Template</b> context menu option. The <b>RTF Style Editor</b> displays. |          |
| 4.   | Alternatively, to create a <b>new Legacy template</b> , right-click on <b>Legacy Templates</b> and select the <b>Create RTF Style Template (Legacy)</b> context menu option. Enterprise Architect displays a prompt for the new template name.      |          |
| 5.   | Type the name of the new template and click on the OK button. The <b>RTF Style Editor</b> displays.                                                                                                                                                 |          |

|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
| RTF Style Editor | <p>The <b>RTF Style Editor</b> contains a list of all available RTF fragments for modification and customization.</p> <p>Each fragment typically contains RTF plus one or more special tag names that Enterprise Architect replaces with information during generation. Currently you cannot alter the content within the tag names, but you can omit a complete tag by removing it, or alter its basic display properties in the surrounding RTF.</p> <p>Special tag names are delimited by # characters; for example, <b>#NOTES#</b></p> <p>Click on the:</p> <ul style="list-style-type: none"> <li>• <b>Get Default</b> button to retrieve the default Enterprise Architect template for the currently-selected template item in the left hand list</li> <li>• <b>Save</b> button to save the version of the template for this style only</li> <li>• <b>Delete</b> button to remove your modified version of the template, which causes Enterprise Architect to use the default template during report generation</li> </ul> <p>To select a template during report generation, click on the <b>Style</b> drop-down arrow on the <b>Rich Text Format Report</b> dialog. Once a style is selected, Enterprise Architect applies that to the current report. Select &lt;Basic&gt; for the inbuilt style.</p> | <a href="#">The Legacy RTF Report Generator</a><br><small>1787</small> |

**Notes:**

- The RTF Style Editor discussed here automatically displays when you modify or create a Legacy RTF template. If you select a template created in the enhanced **RTF Style Template Editor**, that editor opens automatically instead
- You can transport these RTF templates between models, using the **Export Reference Data** and **Import Reference Data** options on the **Project | Model Import/Export** menu
- To delete a template, right-click on it and select the **Delete Document Template** context menu option
- You can also **alter the custom language settings**

**Learn More:**

**17.1.4.11 Save as Document**

The *Document* feature enables a particular documentation configuration to be 'remembered', linking the loaded template within the **Rich Text Format Report** dialog to the current highlighted package. If a particular template is always used with a specific package, and multiple cases of documentation exist to be propagated, saving these as Documents can ease document generation later.

To create and use Documents, follow the steps below

**How To:**

| Step | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | See Also                                                          |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| 1.   | Open the <b>Rich Text Format Report</b> dialog (see <b>The Legacy RTF Report Generator</b> for instructions on how to do this).                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <a href="#">The Legacy RTF Report Generator</a> <sup>[1787]</sup> |
| 2.   | Click on the <b>Save as Document</b> button. The Save current as document definition dialog displays:                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                   |
| 3.   | In the <b>Enter Value</b> field, type a name for the document and click on the <b>OK</b> button. The document is added to the Resources window for easy future access                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                   |
| 4.   | To generate documentation from the <b>Resources</b> window, right-click on the required document. The context menu displays.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                   |
| 5.   | Select the required option.<br>The context menu options are: <ul style="list-style-type: none"> <li>• <b>Open Document</b> - Opens the corresponding .RTF file, as specified by the RTF template Filename property</li> <li>• <b>Generate Document</b> - Opens the <b>Rich Text Format Report</b> dialog, loaded with the specified template</li> <li>• <b>Auto Generate Document</b> - Generates documentation, with the document located at the path specified by the template's Filename property</li> <li>• <b>Delete Document</b> - Removes the specified document</li> </ul> |                                                                   |

#### 17.1.4.12 Custom Language Settings

If you export RTF-format documents from Enterprise Architect in languages other than English, you can customize the codepage, default language ID and character set that Enterprise Architect uses when generating RTF. This makes it much easier to generate documentation appropriate to your country or locale.

You can also set up a list of word substitutions. For instance, where Enterprise Architect would include the word *Figure*, you can specify another word to replace it that is either in your language or more meaningful to your readers.

To Set Up Substitutions, follow the steps below

##### How To:

| Step | Action                                                                                                                              | See Also                                                          |
|------|-------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| 1.   | Open the <b>Rich Text Format Report</b> dialog (see <b>The Legacy RTF Report Generator</b> for how to do this).                     | <a href="#">The Legacy RTF Report Generator</a> <sup>[1787]</sup> |
| 2.   | In the <b>Language</b> panel (bottom left of dialog) click on the Adjust button. The <b>Customize RTF Language</b> dialog displays. |                                                                   |
| 3.   | Double-click on an item to set or clear its <b>Substitute</b> word.                                                                 |                                                                   |
| 4.   | When you have finished, click on the <b>OK</b> button.                                                                              |                                                                   |

To Set Up Codepage and Character Set, Follow the steps below

##### How To:

| Step | Action                                                                                                                                                                              | See Also |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 1.   | From the drop-down lists in the <b>Language</b> , <b>Codepage</b> and <b>Charset</b> fields, select the language, codepage and character set that most closely match your location. |          |
| 2.   | If required, modify the <b>Substitute Tags</b> by double-clicking on each and manually setting the value (for advanced use only).                                                   |          |
| 3.   | To clear the substitution list, double-click on each item in turn and delete the substitute value.                                                                                  |          |
| 4.   | When you have completed the settings, click on the <b>OK</b> button to save them.                                                                                                   |          |

Now when you generate RTF documents, the substitute tags are used in the output.

**Notes:**

- You can transport these language and tag definitions between models, using the **Export Reference Data** and **Import Reference Data** options on the **Project | Model Import/Export** menu

## 17.1.5 Use MS Word

**Topics:**

| Topic        | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | See also                                                                                                                                                                                                                                                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage</b> | <p>To further enhance and customize RTF documentation it is possible to create a custom master document, which can be used to add a table of contents, table of figures, headers and footers and to refresh linked files. In addition it is possible to create documents with sustainable links to generated 'pieces' of Enterprise Architect output, pre-divided by Enterprise Architect using <b>bookmarks</b>.</p> <p>As an alternative to the <i>Word</i> master document, internal to Enterprise Architect, see <i>Virtual Documents</i>.</p> <p>In addition to creating Word master documents, you can:</p> <ul style="list-style-type: none"> <li><b>Open a Report in Microsoft Word</b></li> <li><b>Change Linked Images to Embedded</b></li> <li><b>Apply Other Features of Word</b></li> </ul> | <p><a href="#">RTF Bookmarks</a><sup>[1796]</sup></p> <p><a href="#">Virtual Documents</a><sup>[1774]</sup></p> <p><a href="#">Open a Report in Microsoft Word</a><sup>[1796]</sup></p> <p><a href="#">Change Linked Images to Embedded</a><sup>[1796]</sup></p> <p><a href="#">Other Features of Word</a><sup>[1798]</sup></p> |

**Notes:**

- You can develop a report using the combined facilities of Word and Enterprise Architect with few problems, as long as you leave definition of the section styles to the final stages in Enterprise Architect just prior to report generation. Word truncates the section bookmarks, as it uses a smaller field length

for sections. In Word, you can review and edit reports generated by Enterprise Architect, but you cannot import them back into Enterprise Architect without damaging the section style definition

### 17.1.5.1 Open a Report in Microsoft Word

#### Topics:

| Topic | Detail                                                                                                                                                                                                                             | See also |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| Usage | To open an RTF file in MS Word, simply load Word and open the file as a normal document. Word converts the file. If Word is the default handler of RTF files, then double-click on the output file to load up and view the report. |          |

#### Notes:

- If you have Word configured to view RTF files, you can also click on the **View Output** button on the **Generate RTF Documentation** dialog

### 17.1.5.2 Change Linked Images to Embedded

One of the options available when generating RTF documentation is the ability to store image files in a separate directory to the RTF document. If at a later stage it becomes desirable to embed the images in the RTF documentation, this is especially important when the document is to be distributed. If the images are stored in a separate directory recipients of document see only the placeholder of images rather than the actual images.

If you import an RTF document into Word with the images not embedded into the document, you have the option of breaking the links to the images and saving the image in the document.

To break image links in Word, follow the steps below

#### How To:

| Step | Action                                                        | See Also |
|------|---------------------------------------------------------------|----------|
| 1.   | Open the required RTF file in Word.                           |          |
| 2.   | Select the <b>Edit   Links</b> menu option.                   |          |
| 3.   | Highlight all links in the <b>Links</b> list.                 |          |
| 4.   | Select the <b>Save Picture in Document</b> checkbox.          |          |
| 5.   | Click on the <b>Break Link</b> button.                        |          |
| 6.   | When prompted, click on the <b>Yes</b> button to break links. |          |

Word breaks the links and saves copies of the images inside the document. You can distribute this document without the image directory.

### 17.1.5.3 RTF Bookmarks

Bookmarks are markers that are automatically placed in your rich text document when you generate it. You can create a master document in Word and link to sections of an Enterprise Architect report based on bookmarks. For example, a Word document might have a section for a small part of your component model. Using bookmarks you can generate a full component model, and then link into just one section of the report.

This way you can maintain a complex Word document from parts of Enterprise Architect reports. If you link into Enterprise Architect reports, then you can regenerate the report and refresh Word links to update the master document without having manually changed anything. For more information on refreshing links, see the **Refresh Links** topic.

Bookmarks are GUID-based numbers that can be created for packages, diagrams and elements. A package bookmark applies from the beginning of a package to the end, and includes all child packages and elements underneath.

To bookmark a Section of Enterprise Architect for RTF Documentation, follow the steps below

**How To:**

| Step | Action                                                                                                                                      | See Also |
|------|---------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 1.   | In the Enterprise Architect <b>Project Browser</b> , right-click on the package to include in the documentation. The context menu displays. |          |
| 2.   | Select the <b>Documentation   Copy RTF Bookmark</b> menu option to paste the package into the clipboard as a bookmark for use in Word.      |          |

To Insert a Bookmarked Section of an Enterprise Architect RTF Document into Word, follow the steps below

**How To:**

| Step | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | See Also                                             |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
| 1.   | Open the Word document and position the cursor at the point at which to insert the file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                      |
| 2.   | Select the Word <b>Insert   File</b> menu option. The <b>Insert</b> dialog displays.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                      |
| 3.   | Locate and click on the file to insert, then click on the <b>Range</b> button.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                      |
| 4.   | In the <b>Range</b> cell type or paste the information from the clipboard.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                      |
| 5.   | Click on the <b>OK</b> button.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                      |
| 6.   | <p>Click on the drop-down arrow next to the <b>Insert</b> button. Select the <b>Insert as Link</b> option.</p> <p>The <b>Insert</b> option sets a permanent copy; the <b>Insert as Link</b> option creates a link that is updateable on altering the source document. For <b>Insert as Link</b> to operate you must first set <b>Refresh Links</b>.</p> <p>Every package is bookmarked in the RTF document according to the following rules:</p> <ul style="list-style-type: none"> <li>• All alphabetic and numeric characters remain the same</li> <li>• All other characters (including spaces) are converted to underscores</li> </ul> <p>For example UC01: Use Case Model becomes UC01__Use_Case_Model.</p> | <a href="#">Refresh Links</a><br><small>1801</small> |

**Notes:**

- You cannot use RTF Bookmarking in **Master Document** elements, which effectively replace RTF Bookmarking in Word.

RTF Bookmarking requires each bookmark to be unique. When you generate a report with a standard

RTF template (including in a single Model Document element), each bookmark is unique and there is a 1:1 association between the Elements-details being generated and the elements in the repository. As Master Documents are intended to contain multiple sub-documents, the association ceases to be 1:1. There is no simple method that enables the generated data to be uniquely identified directly in association with the original element

### 17.1.5.4 Other Features of Word

Word offers a considerable number of document enhancement tools to complete your project documentation. Here are some of the things you can do with Word in Enterprise Architect generated RTF documentation:

| Topic                       | Link                                                          |
|-----------------------------|---------------------------------------------------------------|
| Add a Table of Contents     | <a href="#">Add a Table of Contents</a> <sup>[1798]</sup>     |
| Add a Table of Figures      | <a href="#">Add a Table of Figures</a> <sup>[1798]</sup>      |
| Add Headers and Footers     | <a href="#">Add Headers and Footers</a> <sup>[1799]</sup>     |
| Manipulating Tables in Word | <a href="#">Manipulating Tables in Word</a> <sup>[1799]</sup> |
| Refresh Linked Files        | <a href="#">Refresh Linked Files</a> <sup>[1801]</sup>        |

**Notes:**

- Enterprise Architect provides the basic content for your document - use Word to add the presentation and linkages

#### 17.1.5.4.1 Add Table of Contents

Among the features of MS word that can be incorporated into generated Enterprise Architect reports is the option to include a table of contents. A table of contents can be used to aid navigation of documentation and enhance the readability of Enterprise Architect RTF reports. This option provides hyperlinks to the diagrams included in the RTF documentation in the electronic version, and page numbers for both the printed and electronic documentation.

To include a Table of Contents in the RTF documentation, follow the steps below

**How To:**

| Step | Action                                                                                                        | See Also |
|------|---------------------------------------------------------------------------------------------------------------|----------|
| 1    | Open the Enterprise Architect RTF report to which to add a Table of Contents in MS Word                       |          |
| 2    | Select the <b>Insert   Reference   Index and Tables</b> menu option                                           |          |
| 3    | Click on the Table of Contents tab to set the options that are available for formatting the table of contents |          |

The format of the table of contents is dependant on the heading levels created when the RTF is generated. To set the heading style for details in Enterprise Architect RTF documentation, see the RTF **Document Options** topic.

#### 17.1.5.4.2 Add Table of Figures

Among the features of MS word that can be incorporated into generated Enterprise Architect reports is the option to include a table of figures. A table of figures can be used to aid the navigation of the documentation and enhance the readability of Enterprise Architect RTF reports. This option provide hyperlinks to the diagrams included in the RTF documentation in the electronic version and page numbers for both the printed and electronic documentation.

To include a Table of Figures in the RTF documentation, follow the steps below

**How To:**

| Step | Action                                                                                                              | See Also |
|------|---------------------------------------------------------------------------------------------------------------------|----------|
| 1.   | Open the Enterprise Architect RTF report to which to add a Table of Figures in MS Word.                             |          |
| 2.   | Select the <b>Insert   Reference   Index and Tables</b> menu option.                                                |          |
| 3.   | Click on the <b>Table of Figures</b> tab to set the options that are available for formatting the table of figures. |          |

#### 17.1.5.4.3 Add Headers and Footers

Among the features of MS word that can be used to enhance the appearance of Enterprise Architect RTF reports is the ability to add headers and footers to the documentation.

To include headers and footers in the RTF documentation follow the steps below

**How To:**

| Step | Action                                                                                    | See Also |
|------|-------------------------------------------------------------------------------------------|----------|
| 1.   | In MS Word, open the Enterprise Architect RTF report to which to add headers and footers. |          |
| 2.   | Select the <b>View   Header and Footer</b> menu option.                                   |          |

This enables you to enter information into the header section and the footer section of the RTF Documentation.

#### 17.1.5.4.4 Manipulate Tables in Word

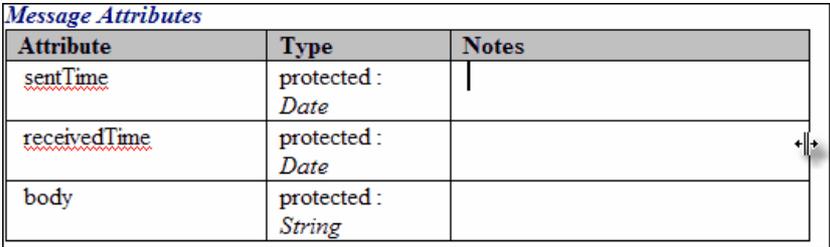

When generating RTF documentation from Enterprise Architect, tables are included when items such as **Attributes** and **Methods** are selected in the **For each Object** section in the **Rich Text Format Report** dialog. MS Word offers several levels of customization for tables and can be used to tidy the formatting of the tables in situations where the margins of the table exceed the dimensions of the page size selected in Word for printing.

### Resize Tables

When the amount of detail for a documented item such as an attribute or operation exceeds the margins of the page in MS Word it is necessary to manually resize the table in order to view all of the details.

To manually resize the table follow the steps below

#### How To:

| Step | Action                                                                                                                                                                                   | See Also |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 1.   | Select the table that exceeds the margin size.                                                                                                                                           |          |
| 2.   | Mouse over the border of the table until the mouse pointer changes into the icon shown below.<br><br> |          |
| 3.   | Drag the cursor to the left to reduce the width of the table and then select the <b>File   Print Preview</b> menu option to confirm that the table borders are within the page margins.  |          |
| 4.   | Resize all of the tables that overhang the margins of the page by using the steps detailed above.                                                                                        |          |

### Applying Styles to Tables

One of the customizable properties of MS Word when working with tables is the ability to apply a style to a table, which enables you to rapidly change the appearance of the table.

To apply styles to a table, follow the steps below

#### How To:

| Step | Action                                                                                                | See Also |
|------|-------------------------------------------------------------------------------------------------------|----------|
| 1.   | Open the Enterprise Architect RTF report in which to change the table styles.                         |          |
| 2.   | Locate and select the table for which to adjust the appearance.                                       |          |
| 3.   | Select the <b>Table   Table Auto Format</b> menu option. The <b>Table Autoformat</b> dialog displays. |          |

From here you can specify a predefined table style from the **Table styles** list, or create a new style by clicking on the **New** button. The table styles defined in the **Table Autoformat** dialog only apply to one table at a time so you must apply the style to each table created individually.

#### 17.1.5.4.5 Refresh Links

If you link into Enterprise Architect reports, then you can regenerate the report and refresh MS Word links to update the Word master document without having manually changed anything.

To ensure that links are refreshed in the master document, you must select the **Update automatic links at Open** checkbox in Word.

To ensure that this setting is established follow the steps below

##### How To:

| Step | Action                                                                                       | See Also |
|------|----------------------------------------------------------------------------------------------|----------|
| 1.   | From within MS Word select the <b>Tools   Options</b> menu option.                           |          |
| 2.   | Select the <b>General</b> tab and select the <b>Update automatic links at Open</b> checkbox. |          |

## 17.2 HTML Reports

| <b>Abstract</b> | <p>Enterprise Architect provides automated web-based publishing of models. A new outline structure closely mirrors the model hierarchy and makes it very simple to explore models on-line. With a great new look and the ability to explore very large models efficiently on-line, the new web-publishing capability is a significant enhancement.</p> <p>Enterprise Architect enables export of an entire model or a single branch of the model to HTML Web pages. The <b>HTML report</b> provides an easy to use, highly detailed, Javascript based model tree. In addition, hyperlinked elements make browsing to related information very simple.</p> <p>The current implementation is based on internal and external templates and generated Javascript. The ability to edit all templates is to be added in a future version of Enterprise Architect.</p> | <a href="#">Create an HTML report</a> <sup>[1802]</sup> |

### Notes:

- You can create **Web Style Templates** to customize your HTML output
- You can use Master Documents and Model Documents to select specific areas of your model for reporting
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Generate Documents** permission to generate HTML documents

### 17.2.1 Create an HTML Report

To create an HTML report, follow the steps below

#### How To:

| Step | Action                                                                                                                                                           | See Also |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 1    | <p>In the Project Browser, right-click on the root package for the report (all child packages are included in the output).</p> <p>The context menu displays.</p> |          |

| Step | Action                                                                                                                    | See Also                                                      |
|------|---------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| 2    | Select the <b>Documentation   HTML Report</b> menu option.<br>The Generate HTML Report dialog displays.                   | <a href="#">Generate HTML Report dialog</a> <sup>[1804]</sup> |
| 3    | In the <b>Output to</b> field, select an output directory for your report.<br>Set any other required options.             |                                                               |
| 4    | Click on the <b>Generate</b> button to generate the report.<br>The <b>Progress</b> field shows total percentage complete. |                                                               |
| 5    | Once the report is complete, click on the <b>View</b> button to launch your default HTML viewer and view the web pages.   |                                                               |

**Topics:**

| Topic                | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | See also                                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Compatibility</b> | <p>The web report produced is compatible with any standard web server, on either Unix or Windows platforms. Simply bundle up the entire output directory and place it within the context of your web server. All path names should be relative and case sensitive.</p> <p>When you view the HTML report in your HTML viewer, you can switch directly to a page for a specific diagram or element by specifying the appropriate GUID after the report web address. That is:</p> <pre>ht t p : // pat h/ pat h/ pat h/ I ndex . ht m? gui d=xxxxxxxxxxxxxx</pre> <p>The word <i>guid</i> must be in lower case, and the value must not include braces { }. For example:</p> <pre>ht t p : // . . . / pat h/ I ndex . ht m?gui d=DC62B0DA- 0D60-4447-85E6-B9BBAE7FC90F</pre> <p>You can obtain the GUID for the diagram or element using the <b>Copy Reference</b> option on the Project Browser <b>Diagram</b>, <b>Element</b> and <b>Package</b> context menu options.</p> <p>The page locator does not work directly in Internet Explorer. Firefox automatically converts the path to <b>file:///C:/path</b> protocol, and actions it. That protocol also works in Internet Explorer. Therefore, to use the absolute references without a web server you must access the path using the <b>file:///</b> protocol.</p> | <a href="#">Diagram Menu</a> <sup>[45]</sup><br><a href="#">Element Menu</a> <sup>[448]</sup><br><a href="#">Package Menu</a> <sup>[444]</sup> |
| <b>Quick Start</b>   | To generate an HTML report right now, follow the steps above on the System Model package of the EAExample project.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                |

**Notes:**

- If you are using Microsoft Internet Explorer 7.0 or later, and you do not have it open, its security profile might block the report display; click on the explanation banner at the top of the screen and select the **Allow Blocked Content** context menu option

### 17.2.2 The Generate HTML Report Dialog

The **Generate HTML Report** dialog is used to generate documentation about your model in HTML format. There are various settings to choose from to control the output, as described below.

| Field                                  | Usage                                                                                                                                                                              | See also                                              |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------|
| <b>Package</b>                         | Display the name of the package you are creating documentation for.                                                                                                                |                                                       |
| <b>Title</b>                           | Type the title for your HTML documentation; defaults to <b>Package</b> .                                                                                                           |                                                       |
| <b>Output to</b>                       | Type the directory path your documentation is saved to.                                                                                                                            |                                                       |
| <b>Style</b>                           | Select a web style template to apply to your documentation (optional).                                                                                                             | <a href="#">Web Style Templates</a> <sup>[1804]</sup> |
| <b>File</b>                            | Specify the file extension for your HTML documentation files; the default is <b>.htm</b> .                                                                                         |                                                       |
| <b>Header Image</b>                    | Enter or select the file path for the header image graphic to display on your HTML output. If you do not specify a file path, the image defaults to the Enterprise Architect logo. |                                                       |
| <b>Preserve White space in Notes</b>   | Preserve existing white space in your notes; deselect to remove white space.                                                                                                       |                                                       |
| <b>No page for Note and Text items</b> | Omit the page for your notes and text items in the HTML report.                                                                                                                    |                                                       |
| <b>Default Diagram</b>                 | Select the diagram the report should open to when the generated documentation is loaded.                                                                                           |                                                       |
| <b>Image Format</b>                    | Select the image file format to save your images in, either PNG or GIF.                                                                                                            |                                                       |
| <b>Include</b>                         | Select each area of your model to include in your report.                                                                                                                          |                                                       |
| <b>System</b>                          | Select each section to generate in your report.                                                                                                                                    |                                                       |

Click on the **Generate** button to generate the HTML report with the settings you have defined.

Click on the **View** button to display the report you have generated.

#### Notes:

- You can also select packages in your model to exclude them (and their subordinate packages) from the HTML reports you generate

### 17.2.3 Web Style Templates

The *HTML and CSS Style Editor* enables you to edit the HTML associated with various sections of the HTML Report facility in Enterprise Architect. You would typically use this functionality to customize a report's look and feel for your company or client. The editor is derived from, and provides the facilities of, the common Code Editor.

**How To:**

To create or edit web style templates, follow the steps below:

| Step | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | See Also |

| <b>Usage</b> | <p>The <b>HTML and CSS Style Editor</b> contains a list of all available HTML fragments for modification and customization.</p> <p>Each fragment typically contains HTML plus one or more special tag names that Enterprise Architect replaces with information during generation. Currently you cannot alter the content within the tag names, but you can omit a complete tag by removing it, or alter its basic display properties in the surrounding HTML.</p> <p>Special tag names are delimited by # characters - for example, <b>#NOTES#</b>.</p> <p>The:</p> <ul style="list-style-type: none"> <li>• <b>Get Default</b> button retrieves the default Enterprise Architect template for the currently selected template item in the left hand list</li> <li>• <b>Save</b> button saves your version of the template for this style only</li> <li>• <b>Delete</b> button removes your modified version of the template, which causes Enterprise Architect to use the default template during report generation</li> </ul> <p>To select a template during generation, use the Style drop-down arrow on the <b>Generate HTML Report dialog</b>. Once a style is selected, Enterprise Architect applies that to the current report. Select &lt;default&gt; for the inbuilt style.</p> | <a href="#">HTML Template Fragments</a><br><small>[1805]</small> |

**Notes:**

- Each time Enterprise Architect generates the web report it overwrites these files, so you must back up your modified versions and copy them back in after every update

## 17.2.4 HTML Template Fragments

This topic identifies each of the HTML Template fragments available through the **HTML and CSS Style Editor**, and defines the fields of each fragment.

| Section               | Fields                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## 17.2.5 Master Documents and Model Documents

Enterprise Architect enables you to generate HTML documentation using Master Document and Model Document elements, just as you do for **RTF reports**. However, there are two differences:

- You do not specify the template in the document elements; you must select it on the Generate HTML Report dialog, in the **Style** field
- You do not use the *SearchName* and *SearchValue* Tagged Values in the Model Document elements to select the generated elements

**Learn More:**

- [Generate HTML Report Dialog](#)<sup>[1804]</sup>

**17.2.5.1 Generate a Master Document (HTML)**

To generate the HTML documentation defined in the Master Document and/or Model Documents, follow the steps below

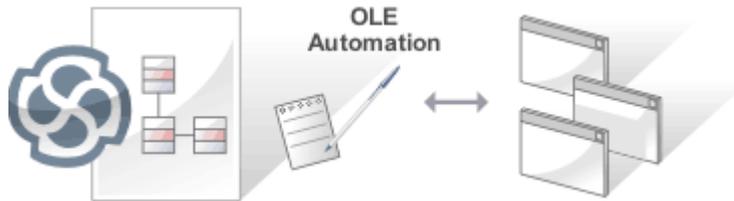

**How To:**

| Step | Action                                                                                                                                                                                                                                                                                                                             | See Also                                                      |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| 1    | On the documentation diagram, click on the Master Document element (or on an independent Model Document element).                                                                                                                                                                                                                  |                                                               |
| 2    | Select the <b>Project   Documentation   HTML Report</b> option.<br>The Generate HTML Report dialog displays.                                                                                                                                                                                                                       |                                                               |
| 3    | Set the options for your HTML document as required. Ensure that you select your Master Document template in the <b>Style</b> field.                                                                                                                                                                                                | <a href="#">Generate HTML Report Dialog</a> <sup>[1804]</sup> |
| 4    | Click on the <b>Generate</b> button to create the documentation.<br>The HTML Report Generator works through the defined content of the Master Document element and/or the Model Document elements and pulls in the information from the listed packages, formatted according to the template identified in the <b>Style</b> field. |                                                               |
| 5    | Click on the <b>View</b> button to view the documentation.                                                                                                                                                                                                                                                                         |                                                               |

| <b>Usage</b> | <p>Scripts executed in Enterprise Architect have access to the currently open model and are a powerful tool for querying and updating the model in situations that would otherwise require you to perform time consuming and repetitive GUI tasks. Enterprise Architect supports management of scripts using the following script engines:</p> <ul style="list-style-type: none"> <li>• JavaScript</li> <li>• Microsoft JScript</li> <li>• Microsoft VBScript</li> </ul> <p>The management interface for Scripting is the <b>Scripting</b> window, which contains the:</p> <ul style="list-style-type: none"> <li>• <b>Script Tree View (Scripts tab)</b>, which you use to review, create and edit scripts</li> <li>• <b>Script Console (Console tab)</b>, which you use to operate on an executing script.</li> </ul> <p>Scripts are managed in groups. The first group in the list is always Local Scripts, which are available to any model. You cannot create, edit, drag-and-drop or delete these scripts. Local Scripts are files in the Scripts subdirectory of the Enterprise Architect installation - any instance of Enterprise Architect that has a currently open model can see these scripts.</p> <p>All other groups are User Scripts, which you create yourself. A user group can be <b>one of five types</b>, each of which applies a template and certain conditions to the scripts you create within that group. User scripts are only visible inside the model in which they were created; the contents of the scripts are stored with the model, although they can be saved to the file system easily using the <b>Script Editor</b>.</p> | <p><a href="#">Script Tab</a> <sup>[1818]</sup></p> <p><a href="#">Console Tab</a> <sup>[1820]</sup></p> <p><a href="#">Script Group Properties</a> <sup>[1819]</sup></p> <p><a href="#">Script Editor</a> <sup>[1407]</sup></p> |

### Notes:

- This facility is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions
- If you intend to use the Scripting facility under Crossover/WINE, you must also install Internet Explorer version 6.0 or above

### 18.1.1 Scripts Tab

|    | <p>Create a new script file in the selected script group; displays a short menu of the types of script you can create, namely:</p> <ul style="list-style-type: none"> <li>• VBScript (  )</li> <li>• JScript (  )</li> <li>• JavaScript (  )</li> </ul> <p>The new script is added to the end of the list in the selected group, with the '<i>New script</i>' text highlighted so that you can type in the script name.</p> |                                                                                                  |
|    | Refresh the script tree in the <b>Scripting</b> window. This icon also reloads any changes made to a workflow script.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                  |
|    | Compile and execute the selected script. The output from the script is written to the <b>Script</b> tab of the <b>Output</b> window, which you display using the <b>View Script Output</b> button (below).                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                  |
|    | Stop an executing script. The icon is disabled if no script is executing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                  |
|    | <p>Delete a <i>script</i> from the model. You cannot use this icon to delete a script <i>group</i> (see the Context Menu section, below), scripts in the Local Scripts group, or a script that is executing.</p> <p>The system prompts you to confirm the deletion only if the <b>Confirm Deletes</b> checkbox is selected in the <b>Project Browser</b> panel of the General page of the <b>Options</b> dialog. If this option is not selected, no prompt is displayed. Script deletion is permanent - scripts cannot be recovered.</p>                                                                                                                                       | <a href="#">Script Tab</a> <sup>[1818]</sup><br><a href="#">General setting</a> <sup>[422]</sup> |
|  | Display the <b>Output</b> window with the results of the most recently executed script displayed in the <b>Script</b> tab.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                  |

**Notes:**

- This facility is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions
- If you select to delete a script group that contains scripts, the system always prompts you to confirm the action regardless of any system settings for delete operations. Be certain that you intend to delete the group and its scripts before confirming the deletion - deletion of script groups and scripts is permanent

| <b>Abstract</b>         | <p>The script console is a tab of the <b>Scripting</b> window. It is a command line interpreter with which you can quickly enable a script engine and enter commands to act on the script.</p> <p>You type the commands in the field at the bottom of the tab; when you press the ( <b>Enter</b> ) key, the script console executes the commands and displays any output immediately.</p> <p>You can input two types of command:</p> <ul style="list-style-type: none"> <li>• Console commands</li> <li>• Script commands</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |          |
| <b>Console Commands</b> | <p>Console commands are preceded by the ! character and instruct the console to perform an action. The available console commands are listed below; to list these commands on the <b>Console</b> tab itself (as shown above) type ? in the console field (without the preceding ! character) and press ( <b>Enter</b> ) .</p> <ul style="list-style-type: none"> <li>• <b>c(lear)</b> - clears the console display</li> <li>• <b>sa(ve)</b> - saves the console display to a file</li> <li>• <b>h(elp)</b> - prints a list of commands, as for ?</li> <li>• <b>VB</b> - opens a VBScript console</li> <li>• <b>JA</b> - opens a JavaScript console</li> <li>• <b>JS</b> - opens a JScript console</li> <li>• <b>st(op)</b> - closes any script running console</li> <li>• <b>i(nclude) name</b> - executes the named script item; name is of the format <i>GroupName.ScriptName</i> (spaces are allowed in names)</li> <li>• <b>?</b> - (without the !) lists commands</li> <li>• <b>?name</b> - Outputs the value of a variable name (only if a script console is opened)</li> </ul> |          |
| <b>Script Commands</b>  | <p>A script command is script code that depends on the script engine. Script commands can be executed only once a script console has been created.</p> <p>Examples:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |          |

| Topic                      | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | See also |

| Topic                                                | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | See also                                                                                                                                                          |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Introduction</b>                                  | <p>Automation provides a way for other applications to access the information in an Enterprise Architect model using Windows OLE Automation (ActiveX). Typically this involves scripting clients such as MS Word or Visual Basic, or using scripts created within Enterprise Architect using the <b>Scripting window</b>.</p> <p>The Automation Interface provides a way of accessing the internals of Enterprise Architect models. Examples of things you can do using the Automation Interface include:</p> <ul style="list-style-type: none"> <li>• Perform repetitive tasks, such as update the version number for all elements in a model</li> <li>• Generate code from a State Machine diagram</li> <li>• Produce custom reports</li> <li>• Perform ad hoc queries</li> </ul> | <a href="#">Scripting</a> <sup>[1817]</sup>                                                                                                                       |
| <b>Connecting to the Automation Interface</b>        | All development environments capable of generating <i>ActiveX</i> Com clients should be able to connect to the Enterprise Architect Automation Interface. This guide provides detailed instructions on connecting to the interface using Microsoft Visual Basic 6.0, Borland Delphi 7.0, Microsoft C# and Java. There are also more detailed steps on how to set-up Visual Basic; the principles are applicable to other languages.                                                                                                                                                                                                                                                                                                                                                 | <a href="#">Connecting to the Interface</a> <sup>[1823]</sup><br><a href="#">Set References in Visual Basic</a> <sup>[1825]</sup>                                 |
| <b>Examples and Tips</b>                             | Instruction on how to use the Automation Interface is provided by means of sample code. See pointers to the samples and other available resources. Also, consult the extensive Reference Section.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <a href="#">Pointers to the Samples</a> <sup>[1826]</sup><br><a href="#">Available Resources</a> <sup>[1828]</sup><br><a href="#">Reference</a> <sup>[1828]</sup> |
| <b>Calling Executables from Enterprise Architect</b> | Enterprise Architect can be set up to call an external application. You can pass parameters on the current position selected in the <b>Project Browser</b> to the application being called. For instructions, go to the Call from Enterprise Architect topic. A more sophisticated method is to create Add-Ins, which are discussed in a separate topic.                                                                                                                                                                                                                                                                                                                                                                                                                            | <a href="#">Call from Enterprise Architect</a> <sup>[1827]</sup><br><a href="#">Add-Ins</a> <sup>[1967]</sup>                                                     |

### 18.2.1 Using the Automation Interface

This section provides instructions on how to connect to and use the Automation Interface, including:

| Topic                       | Link                                                          |

### 18.2.1.1 Connect to the Interface

All development environments capable of generating ActiveX Com clients should be able to connect to the Enterprise Architect Automation Interface.

By way of example, the following sections describe how to connect using several such tools. The procedure might vary slightly with different versions of these products.

#### How To - Microsoft Visual Basic 6.0

| Step | Action                                                                                                                                                                                                                                                             | See Also |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 1.   | Create a new project.                                                                                                                                                                                                                                              |          |
| 2.   | Select the <b>Project   References</b> menu option.                                                                                                                                                                                                                |          |
| 3.   | Select <i>Enterprise Architect Object Model 2.0</i> from the list. (If this does not appear, go to the command line and re-register Enterprise Architect using<br><br><i>EA.exe /unregister</i><br><br>then<br><br><i>EA.exe /register</i> ).                      |          |
| 4.   | See the general library documentation on the use of Classes. The following example creates and opens a repository object:<br><br><pre>Public Sub ShowRepository()<br/>    Dim MyRep As New EA.Repository<br/>    MyRep.OpenFile "c:\eat est.eap"<br/>End Sub</pre> |          |

#### How To - Borland Delphi 7.0

| Step | Action                                                                                                                                                                                                                                        | See Also |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 1.   | Create a new project.                                                                                                                                                                                                                         |          |
| 2.   | Select the <b>Project   Import Type Library</b> menu option.                                                                                                                                                                                  |          |
| 3.   | Select <b>Enterprise Architect Object Model 2.0</b> from the list. (If this does not appear, go to the command line and re-register Enterprise Architect using<br><br><i>EA.exe /unregister</i><br><br>then<br><br><i>EA.exe /register</i> ). |          |

| Step | Action                                                                                                                                                                                                                                                                                                     | See Also |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 4.   | Click on the <b>Create Unit</b> button.                                                                                                                                                                                                                                                                    |          |
| 5.   | Include <i>EA_TLB</i> in Project1's <i>Uses</i> clause.                                                                                                                                                                                                                                                    |          |
| 6.   | See the general library documentation on the use of Classes. The following example creates and opens a repository object: <pre> procedure TForm1.Button1Click(Sender: TObject); var   r: TRepository;   b: boolean; begin   r := TRepository.Create(nil);   b := r.OpenFile('c:\eat est.eap'); end; </pre> |          |

#### How To - Microsoft C#

| Step | Action                                                                                                                                                                                                                                                                                  | See Also |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 1.   | Select the Visual Studio <b>Project   Add Reference</b> menu option.                                                                                                                                                                                                                    |          |
| 2.   | Click on the <b>Browse</b> tab.                                                                                                                                                                                                                                                         |          |
| 3.   | Navigate to the folder in which you installed Enterprise Architect (usually <i>Program Files/ Sparx Systems/ EA</i> ) and select <i>Interop. EA.dll</i> .                                                                                                                               |          |
| 4.   | See the general library documentation on the use of Classes. The following example creates and opens a repository object: <pre> private void button1_Click(object sender, System.EventArgs e) {   EA.Repository r = new EA.RepositoryClass();   r.OpenFile("c:\\eat est.eap"); } </pre> |          |

#### How To - Java

| Step | Action                                                                                                                                                                                                                                                 | See Also                                                                                                        |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| 1.   | Copy the file <i>SSJavaCOM.dll</i> from the <i>Java API</i> subdirectory of your installed directory (usually <i>Program Files/ Sparx Systems/ EA</i> ) into any location within the Windows PATH. For example, the <i>windows\system32</i> directory. |                                                                                                                 |
| 2.   | Copy the <i>eaapi.jar</i> file from the <i>Java API</i> subdirectory of your installed directory (usually <i>Program Files/ Sparx Systems/ EA</i> ) to a location in the Java CLASSPATH or where the Java class loader can find it at run time.        |                                                                                                                 |
| 3.   | All of the Classes described in the documentation are in the package <i>org.sparx</i> . See the <b>general library documentation</b> for their use. The following example creates and opens a repository object.                                       | <a href="#">Reference</a>  |

| Step | Action                                                                                                                                     | See Also |
|------|--------------------------------------------------------------------------------------------------------------------------------------------|----------|
|      | <pre> public void OpenRepository() {     org.sparx.Repository r = new org.sparx. Repository();     r.OpenFile("c:\\eat est.eap"); } </pre> |          |

### 18.2.1.1.1 Set References In Visual Basic

This topic describes how to use the Enterprise Architect ActiveX interface with Visual Basic (VB). Use is ensured for Visual Basic version 6. This might vary slightly with versions other than version 6.

It is assumed that you have accessed VB through a Microsoft Application such as VB 6.0, MS Word or MS Access. If the code is not called from within Word, the *Word VB* reference must also be set.

On creating a new VB project, set a reference to an Enterprise Architect Type Library and a Word Type Library. Follow the steps below:

#### How To

| Step | Action                                                                                                 | See Also |
|------|--------------------------------------------------------------------------------------------------------|----------|
| 1.   | Select the <b>Tools   References</b> menu option. The following dialog displays:                       |          |
| 2.   | Select the <b>Enterprise Architect Object Model 2.10</b> checkbox from the list.                       |          |
| 3.   | Do the same for VB or VB Word: select the checkbox for the <b>Microsoft Word 10.0 Object Library</b> . |          |
| 4.   | Click on the <b>OK</b> button.                                                                         |          |

#### Notes:

- If Enterprise Architect Object Model 2.10 does not appear in the list, go to the command line and manually re-enter Enterprise Architect using the following:
  - To unregister Enterprise Architect: `ea.exe /unregister`
  - To register Enterprise Architect: `ea.exe /register`
- **Visual Basic 5/6** users should also note that the version number of the Enterprise Architect interface is stored in the VBP project file in a form similar to the following:

```

Reference=* \ G{ 64FB2BF4- 9EFA- 11D2- 8307- C45586000000} #2. 2#0#... \ . . . \ . . .
\ Program Files\ Sparx Systems\ EA\ EA. TLB#Ent erpri se Archi tect Obj ect
Model 2. 02

```

If you experience problems moving from one version of Enterprise Architect to another, open the VBP file in a text editor and remove this line. Then open the project in Visual Basic and use Project-References to create a new reference to the Enterprise Architect Object model

Reference to objects in Enterprise Architect and Word should now be available in the **Object Browser**. This can be accessed from the main menu by selecting **View | Object Browser**, or by pressing ( **F2** )

The drop-down list on the top-left of the window should now include Enterprise Architect and Word. If MS-Project is installed this must also be set up

### 18.2.1.2 Examples and Tips

#### Topics:

| Topic                                   | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | See also                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage</b>                            | <p>Instructions for using the interface are provided through sample code. There are several sets of examples:</p> <ul style="list-style-type: none"> <li>• VB 6 and C# examples are available in the Code Samples folder under your Enterprise Architect installation (default: C: \ P r o g r a m F i l e s \ S p a r x S y s t e m s \ E A \ C o d e S a m p l e s )</li> <li>• Enterprise Architect can be set up to <b>call an external application</b></li> <li>• Several VB.NET code snippets are provided in the <b>reference section</b></li> <li>• A comprehensive example of using Visual Basic to create MS Word documentation is available from the internet at <b>www.sparxsystems.com/resources/developers/autint_vb.html</b></li> <li>• Additional samples are available from the Sparx Systems website; see the <b>Available Resources</b> topic</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p><a href="#">Call an External Application</a> <small>[1827]</small></p> <p><a href="#">Code Samples</a> <small>[1952]</small></p> <p><a href="http://www.sparxsystems.com/resources/developers/autint_vb.html">www.sparxsystems.com/resources/developers/autint_vb.html</a><br/>(Online Resource)</p> <p><a href="#">Available Resources</a> <small>[1828]</small></p> |
| <b>Tips and Tricks</b>                  | <p>Additionally, you should note the following tips and tricks:</p> <ul style="list-style-type: none"> <li>• An instance of the Enterprise Architect (EA.exe) process is executed when you initialize a new repository object. This process must remain running in order to perform automation tasks. If the main window is visible, you can safely minimize it, but it must remain running.</li> <li>• The Enterprise Architect ActiveX Interface is a functional interface rather than a data interface. When you load data through the interface there is a noticeable delay as Enterprise Architect user interface elements (such as Windows, menus) are loaded and the specified database connection is established.</li> <li>• Collections use a zero-based index; for example, Repository.Models(0) represents the first model in the repository.</li> <li>• During the development of your client software your program might terminate unexpectedly and leave EA.exe running in such a state that it is unable to support further interface calls. If your program terminates abnormally, ensure that Enterprise Architect is not left running in the background (see the Windows <b>Task Manager / Process</b> tab).</li> <li>• A handle to a currently running instance of Enterprise Architect can be obtained through the use of a GetObject() call. For more information, refer to the reference page for the <b>App</b> object. Accessing your Enterprise Architect model via the App object enables querying the current User Interface status, such as using GetContextItem() on the <b>Repository</b> object to detect the current selection by the user, allowing for rapid prototyping and testing</li> </ul> | <p><a href="#">Repository Class</a> <small>[1855]</small></p> <p><a href="#">App Class</a> <small>[1830]</small></p>                                                                                                                                                                                                                                                     |
| <b>Enterprise Architect Not Closing</b> | <p>If your automation controller was written using the .NET framework, Enterprise Architect does not close even after you release all your references to it. To force the release of the COM pointers, call the memory management functions as shown</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p><a href="#">Tricks and Traps</a> <small>[1972]</small></p>                                                                                                                                                                                                                                                                                                            |

### 18.2.1.2.1 Call from Enterprise Architect

Enterprise Architect can be set up to call an external application. You can pass parameters on the current position selected in the **Project Browser** to the application being called.

**Access:** **Tools | Customize > Tools**

To define an application that you can run from Enterprise Architect, select the **Tools | Customize** menu option. The **Customize** dialog displays. Select the **Tools** tab.

**Topics:**

| Topic       | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                  | See also |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| <b>Uses</b> | <p>With this you can:</p> <ul style="list-style-type: none"> <li>• Add a command line for an application</li> <li>• Define parameters to pass to this application</li> </ul> <p>The parameters required for running the AutInt executable are:</p> <ul style="list-style-type: none"> <li>• The Enterprise Architect file parameter \$f and</li> <li>• The current PackageID \$p</li> </ul> <p>Hence the arguments should simply contain: \$f , \$p</p> |          |

The available parameters for passing information to external applications are:

| Parameter | Description                                | Notes                                         |
|-----------|--------------------------------------------|-----------------------------------------------|
| \$d       | Diagram ID                                 | ID for accessing associated diagram.          |
| \$D       | Diagram GUID                               | GUID for accessing the associated diagram.    |
| \$e       | Comma separated list of element IDs        | All elements selected in the current diagram. |
| \$E       | Comma separated list of element GUIDs      | All elements selected in the current diagram. |
| \$f       | Project Name                               | For example: C:\projects\EAexample.eap.       |
| \$F       | Calling Application (Enterprise Architect) | 'Enterprise Architect'.                       |
| \$p       | Current Package ID                         | For example: 144.                             |
| \$P       | Package GUID                               | GUID for accessing this package.              |

Once this has been set up, the application can be called from the main menu in Enterprise Architect using the **Add-Ins | <YourApplication>** menu option.

### 18.2.1.2.2 Available Resources

Other available resources include:

| Resource                                                                                                                      | Download Link                                                                                                                                                  |
|-------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VB 6 Add-In for generating MS Word documentation.                                                                             | <a href="http://www.sparxsystems.com/resources/developers/autint_vb.html">www.sparxsystems.com/resources/developers/autint_vb.html</a>                         |
| VB 6 Add-In to display a custom ActiveX graph control within the Enterprise Architect window as a new view.                   | <a href="http://www.sparxsystems.com/resources/developers/autint_vb_custom_view.html">www.sparxsystems.com/resources/developers/autint_vb_custom_view.html</a> |
| A basic Add-In framework written in C#. Useful as a starting point for authoring your own custom Enterprise Architect Add-In. | <a href="http://www.sparxsystems.com/bin/CS_AddinFramework.zip">www.sparxsystems.com/bin/CS_AddinFramework.zip</a>                                             |
| An extension on the <i>CS_AddinFramework</i> example showing how to export Tagged Values to a .csv file.                      | <a href="http://www.sparxsystems.com/bin/CS_AddinTaggedCSV.zip">www.sparxsystems.com/bin/CS_AddinTaggedCSV.zip</a>                                             |
| A basic Add-In skeleton written in Delphi.                                                                                    | <a href="http://www.sparxsystems.com/bin/DelphiDemo.zip">www.sparxsystems.com/bin/DelphiDemo.zip</a>                                                           |
| A simple example Add-In written in C#.                                                                                        | <a href="http://www.sparxsystems.com/bin/CS_Sample.zip">www.sparxsystems.com/bin/CS_Sample.zip</a>                                                             |

### 18.2.2.1 Interface Overview Package

This package provides an overview of the main components of the Automation Interface. These include the:

| Topic                           | Detail                                                                               | Link                                                       |
|---------------------------------|--------------------------------------------------------------------------------------|------------------------------------------------------------|
| <b>Repository Package</b>       | Represents the model as a whole and provides entry to model packages and collections | <a href="#">Repository Package</a> <sup>[1838]</sup>       |
| <b>Element Package</b>          | Identifies the basic structural units (such as Class, Use Case and Object)           | <a href="#">Element Package</a> <sup>[1873]</sup>          |
| <b>Element Features Package</b> | Identifies the attributes and operations defined on an element                       | <a href="#">Element Features Package</a> <sup>[1897]</sup> |
| <b>Diagram Package</b>          | Describes the visible drawings contained in the model                                | <a href="#">Diagram Package</a> <sup>[1920]</sup>          |
| <b>Connector Package</b>        | Defines the relationships between elements                                           | <a href="#">Connector Package</a> <sup>[1910]</sup>        |

The following diagram illustrates the main interface packages and their associated contents. Each element in this document is creatable by Automation and can be accessed through the various collections that exist or, in some cases, directly.

The *Repository* Class is the starting point for all use of the automation interface. It contains the high level system objects and entry point into the model itself using the *Models* collection and the other system level collections.

### 18.2.2.2 App Object

The *App* object represents a running instance of Enterprise Architect. Its object provides access to the Automation Interface.

| Attribute  | Type       | Notes                                                  |
|------------|------------|--------------------------------------------------------|
| Project    | Project    | Read only. Provides a handle to the Project Interface. |
| Repository | Repository | Read only. Provides a handle to the Repository object. |
| Visible    | Boolean    | Read/Write. Whether or not the application is visible. |

| Topic                      | Detail                                                                                                                          | Link |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------|------|
| <b>GetObject() Support</b> | The <i>App</i> object is creatable and a handle can be obtained by creating one. In addition, clients can use the equivalent of |      |

| Topic | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Link |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|
|       | <p>Visual Basic's <i>GetObject()</i> to obtain a reference to a currently running instance of Enterprise Architect.</p> <p>Use this method to more quickly test changes to Add-Ins and external clients, as the Enterprise Architect application and data files do not have to be constantly re-loaded.</p> <p>For example:</p> <pre>Dim App as EA.App Set App = GetObject(, "EA.App") MsgBox App.Repository.Models.Count</pre> <p>Another example, which uses the App object without saving it to a variable:</p> <pre>Dim Rep as EA.Repository Set Rep = GetObject(, "EA.App"). Repository MsgBox Rep.ConnectionString</pre> |      |

### 18.2.2.3 Enumerations

The following enumerations are defined by the Automation Interface:

| Enumeration                   | Link                                                   |
|-------------------------------|--------------------------------------------------------|
| Constant Layout Styles        | <a href="#">ConstLayoutStyles</a> <sup>[1832]</sup>    |
| Create Baseline Flag          | <a href="#">CreateBaselineFlag</a> <sup>[1832]</sup>   |
| Create Model Type             | <a href="#">CreateModelType</a> <sup>[1832]</sup>      |
| Document Break                | <a href="#">DocumentBreak</a> <sup>[1833]</sup>        |
| Document Type                 | <a href="#">DocumentType</a> <sup>[1833]</sup>         |
| EA Edition Types              | <a href="#">EAEditionTypes</a> <sup>[1833]</sup>       |
| Enumeration Relation Set Type | <a href="#">EnumRelationSetType</a> <sup>[1834]</sup>  |
| Export Package XML Flag       | <a href="#">ExportPackageXMLFlag</a> <sup>[1834]</sup> |
| Mail Interface Message Flag   | <a href="#">MessageFlag</a> <sup>[1835]</sup>          |
| MDG Menus                     | <a href="#">MDGMenus</a> <sup>[1834]</sup>             |
| Object Type                   | <a href="#">ObjectType</a> <sup>[1835]</sup>           |
| PropType                      | <a href="#">PropType</a> <sup>[1836]</sup>             |
| Reload Type                   | <a href="#">ReloadType</a> <sup>[1837]</sup>           |
| Scenario Diagram Type         | <a href="#">ScenarioDiagramType</a> <sup>[1837]</sup>  |
| Scenario Step Type            | <a href="#">ScenarioStepType</a> <sup>[1838]</sup>     |
| Scenario Test Type            | <a href="#">ScenarioTestType</a> <sup>[1838]</sup>     |
| XMI Type                      | <a href="#">XMIType</a> <sup>[1838]</sup>              |

### 18.2.2.3.1 ConstLayoutStyles

The *enum* values defined here are used exclusively for the *Lay Out a Diagram* method. They enable you to define the layout options as depicted in the **Diagram | Layout Diagram** menu option.

| Value                              | Meaning                                                                     |
|------------------------------------|-----------------------------------------------------------------------------|
| <i>IsCrossReduceAggressive</i>     | Perform aggressive Cross-reduction in the layout process (time consuming)   |
| <i>IsCycleRemoveDFS</i>            | Use the <i>Depth First Cycle Removal</i> algorithm                          |
| <i>IsCycleRemoveGreedy</i>         | Use the <i>Greedy Cycle Removal</i> algorithm                               |
| <i>IsDiagramDefault</i>            | Use existing layout options specified for this diagram                      |
| <i>IsInitializeDFSIn</i>           | Initialize the layout using the <i>Depth First Search Inward</i> algorithm  |
| <i>IsInitializeNaive</i>           | Initialize the layout using the <i>Naïve Initialize Indices</i> algorithm   |
| <i>IsInitializeDFSOut</i>          | Initialize the layout using the <i>Depth First Search Outward</i> algorithm |
| <i>IsLayeringLongestPathSink</i>   | Layer the diagram using the <i>Longest Path Sink</i> algorithm              |
| <i>IsLayeringLongestPathSource</i> | Layer the diagram using the <i>Longest Path Source</i> algorithm            |
| <i>IsLayeringOptimalLinkLength</i> | Layer the diagram using the <i>Optimal Link Length</i> algorithm            |
| <i>IsLayoutDirectionDown</i>       | Direct connectors to point down                                             |
| <i>IsLayoutDirectionLeft</i>       | Direct connectors to point left                                             |
| <i>IsLayoutDirectionRight</i>      | Direct connectors to point right                                            |
| <i>IsLayoutDirectionUp</i>         | Direct connectors to point up                                               |
| <i>IsProgramDefault</i>            | Use factory default layout options as specified by Enterprise Architect     |

#### Learn More:

- [Lay Out a Diagram](#) <sup>[619]</sup>

### 18.2.2.3.2 CreateBaselineFlag

The *CreateBaselineFlag* enumeration is used in Baseline Management, when creating a Baseline.

| Value               | Meaning                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------|
| <i>cbSaveToStub</i> | Baseline this package with only immediate children (child packages are included as stubs only) |

### 18.2.2.3.3 CreateModelType

The *CreateModelType* enumeration is used in the **CreateModel** method on the Repository Class.

| Value                | Meaning                                                           |
|----------------------|-------------------------------------------------------------------|
| <i>cmEAPFromBase</i> | Create a copy of the EABase model file to the specified file path |

| Value                         | Meaning                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <i>cmEAPFromSQLRepository</i> | Create a .eap file shortcut to an SQL-based repository; requires user interaction to provide sql connection details |

**Learn More:**

- [CreateModel Method](#)<sup>[1859]</sup>

**18.2.2.3.4 DocumentBreak**

The *DocumentBreak* enumeration is used in the **InsertBreak** method on the *DocumentGenerator* Class.

| Value               | Meaning                                |
|---------------------|----------------------------------------|
| <i>breakPage</i>    | Insert a page break in the document    |
| <i>breakSection</i> | Insert a section break in the document |

**Learn More:**

- [InsertBreak Method](#)<sup>[1949]</sup>

**18.2.2.3.5 DocumentType**

The *DocumentType* enumeration is used in the **SaveDocument** method on the *DocumentGenerator* Class.

| Value         | Meaning                                            |
|---------------|----------------------------------------------------|
| <i>dtHTML</i> | Save the document file to disk as an HTML document |
| <i>dtRTF</i>  | Save the document file to disk as an RTF document  |

**Learn More:**

**18.2.2.3.6 EAEditionTypes**

| Topic                | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | See Also |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| <b>General Usage</b> | <p>The <i>EAEditionTypes</i> enumeration identifies the current level of licensed functionality available; for example:</p> <pre>EAEditionTypes theEdition = theRepository.Get EAEdition(); if ( theEdition == EAEditionTypes. pi Desktop ) ... else if ( theEdition == EAEditionTypes.pi Professional ) ...</pre> <p>The enumeration defines the following formal values:</p> <ul style="list-style-type: none"> <li>• <i>piLite</i></li> <li>• <i>piDesktop</i></li> <li>• <i>piProfessional</i></li> </ul> |          |

| Topic | Detail                                                                                                                                                                                                                                                                                                                                                                         | See Also |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|       | <ul style="list-style-type: none"> <li>• <i>piCorporate</i></li> <li>• <i>piBusiness</i></li> <li>• <i>piSystemEng</i></li> <li>• <i>piUltimate</i></li> </ul> <p>There is no separate value for the trial edition; the <i>Repository.GetEAEdition()</i> function returns the appropriate <b>EAEditionTypes</b> value for whichever edition the user has selected to trial</p> |          |

### 18.2.2.3.7 EnumRelationSetType

This enumeration represents values returned from the *GetRelationSet* method of the **Element** object.

| Value                    | Meaning                                                      |
|--------------------------|--------------------------------------------------------------|
| <i>rsDependEnd</i>       | List of elements that depend on the current element          |
| <i>rsDependStart</i>     | List of elements that the current element depends on         |
| <i>rsGeneralizeEnd</i>   | List of elements that are generalized by the current element |
| <i>rsGeneralizeStart</i> | List of elements that the current element generalizes        |
| <i>rsParents</i>         | List of all parent elements of the current element           |
| <i>rsRealizeEnd</i>      | List of elements that are realized by the current element    |
| <i>rsRealizeStart</i>    | List of elements that the current element realizes           |

- [Element Class](#) <sup>1877</sup>

### 18.2.2.3.8 ExportPackageXMIFlag

The *ExportPackageXMIFlag* enumeration is used in package control, when exporting to XML.

| Value               | Meaning                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------|
| <i>epSaveToStub</i> | Export this package with only immediate children (child packages are included as stubs only) |

### 18.2.2.3.9 MDGMenus

Use this enumeration when providing the *HiddenMenus* property to *MDG\_GetProperty*.

These options are exclusive of one another and can be read or added to hide more than one menu.

| Value                 | Meaning                               |
|-----------------------|---------------------------------------|
| <i>mgBuildProject</i> | Hide <b>Build Project</b> menu option |
| <i>mgMerge</i>        | Hide <b>Merge</b> menu option         |

| Value        | Meaning                     |
|--------------|-----------------------------|
| <i>mgRun</i> | Hide <b>Run</b> menu option |

**Learn More:**

- [MDG.GetProperty](#)<sup>[2046]</sup>

**18.2.2.3.10 MessageFlag**

The *MessageFlag* enumeration is used in both the **SendMessage** and **ComposeMailMessage** methods of the MailInterface, to specify a flag to attach to the message.

| Value             | Meaning                               |
|-------------------|---------------------------------------|
| <b>mfNone</b>     | Do not flag the message               |
| <b>mfComplete</b> | Flag the message as 'Complete'        |
| <b>mfPurple</b>   | Flag the message with a 'Purple' flag |
| <b>mfOrange</b>   | Flag the message with a 'Orange' flag |
| <b>mfGreen</b>    | Flag the message with a 'Green' flag  |
| <b>mfYellow</b>   | Flag the message with a 'Yellow' flag |
| <b>mfBlue</b>     | Flag the message with a 'Blue' flag   |
| <b>mfRed</b>      | Flag the message with a 'Red' flag    |

**18.2.2.3.11 ObjectType**

| Topic                           | Detail                                                                                                                                                                                                                                                                                               | See Also |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| <b>General Usage</b>            | <p>The <i>ObjectType</i> enumeration identifies Enterprise Architect object types even when referenced through a Dispatch interface</p> <p>For example:</p> <pre> Object ob = Repository.GetElementById ( 13 ); if ( ob.ObjectType == otElement ) ; else if ( ob.ObjectType == otAuthor ) ... </pre> |          |
| <b>Valid Enumeration Values</b> | <p><i>otAttribute</i><br/> <i>otAttributeConstraint</i><br/> <i>otAttributeTag</i><br/> <i>otAuthor</i><br/> <i>otClient</i><br/> <i>otCollection</i><br/> <i>otConnector</i><br/> <i>otConnectorConstraint</i><br/> <i>otConnectorEnd</i><br/> <i>otConnectorTag</i><br/> <i>otConstraint</i></p>   |          |

| Topic | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | See Also |

#### 18.2.2.3.12 PropType

The *PropType* enumeration gives the automation programmer an indication of what sort of data is going to be stored by this property.

| Value          | Meaning                                |
|----------------|----------------------------------------|
| <i>ptArray</i> | An array containing values of any type |

| Value                  | Meaning                                                                                                    |
|------------------------|------------------------------------------------------------------------------------------------------------|
| <i>ptBoolean</i>       | True or False                                                                                              |
| <i>ptEnum</i>          | A string being an entry in the semi-colon separated list specified in the validation field of the Property |
| <i>ptFloatingPoint</i> | 4 or 8 byte floating point value                                                                           |
| <i>ptInteger</i>       | 16-bit or 32-bit signed integer                                                                            |
| <i>ptString</i>        | Unicode string                                                                                             |

### 18.2.2.3.13 ReloadType

This enumeration represents values returned from the *GetReloadItem* and *PeekReloadItem* methods of the *ModelWatcher* Class. It has four possible values, which define the type of change that was made to a model.

| Value                | Meaning                                                                         |
|----------------------|---------------------------------------------------------------------------------|
| <i>rtElement</i>     | The <i>Item</i> parameter represents a particular element that must be reloaded |
| <i>rtEntireModel</i> | Entire model must be reloaded to ensure that all changes are reloaded           |
| <i>rtNone</i>        | No change in the model                                                          |
| <i>rtPackage</i>     | The <i>Item</i> parameter represents a particular package that must be reloaded |

### 18.2.2.3.14 ScenarioDiagramType

The *ScenarioDiagramType* enumeration provides the following enumeration values to the **Project.GenerateDiagramFromScenario()** method. They specify the type of diagram to generate.

| Value                                  | Meaning                                                | See also                                                         |
|----------------------------------------|--------------------------------------------------------|------------------------------------------------------------------|
| <i>sdActivity</i>                      | Generate an Activity diagram                           | <a href="#">Generated Activity diagram</a> <sup>[677]</sup>      |
| <i>sdActivityWithAction</i>            | Generate an Activity diagram with an Action            | <a href="#">Generated Activity diagram</a> <sup>[677]</sup>      |
| <i>sdActivityWithActionPin</i>         | Generate an Activity diagram with an ActionPin         | <a href="#">Generated Activity diagram</a> <sup>[677]</sup>      |
| <i>sdActivityWithActivityParameter</i> | Generate an Activity diagram with an ActivityParameter | <a href="#">Generated Activity diagram</a> <sup>[677]</sup>      |
| <i>sdRobustness</i>                    | Generate a Robustness diagram                          | <a href="#">Generated Robustness diagram</a> <sup>[683]</sup>    |
| <i>sdRuleFlow</i>                      | Generate a RuleFlow diagram                            | <a href="#">Generated RuleFlow diagram</a> <sup>[678]</sup>      |
| <i>sdSequence</i>                      | Generate a Sequence diagram                            | <a href="#">Generated Sequence diagram</a> <sup>[681]</sup>      |
| <i>sdState</i>                         | Generate a State Machine diagram                       | <a href="#">Generated State Machine diagram</a> <sup>[679]</sup> |

**Learn More:**

- [Project.GenerateDiagramFromScenario\(\) Method](#)<sup>[1935]</sup>

### 18.2.2.3.15 ScenarioStepType

The *ScenarioStepType* enumeration is used to identify the **steps** of a scenario, and the entity performing the step.

| Value           | Meaning                                                     | See also |
|-----------------|-------------------------------------------------------------|----------|
| <i>stActor</i>  | Identify that the step is an action performed by an actor   |          |
| <i>stSystem</i> | Identify that the step is an action performed by the system |          |

#### Learn More:

- [Scenario Step Class](#)<sup>[1894]</sup>

### 18.2.2.3.16 ScenarioTestType

The *ScenarioTestType* enumeration provides the following enumeration values to the **Project.GenerateTestFromScenario()** method. They specify the type of test to generate.

| Value             | Meaning                                | See also |
|-------------------|----------------------------------------|----------|
| <i>stExternal</i> | Generate an external Test Case element |          |
| <i>stInternal</i> | Generate an internal test              |          |

#### Learn More:

- [Project.GenerateTestFromScenario\(\) Method](#)<sup>[1937]</sup>
- [Generate Test Classes](#)<sup>[685]</sup>

### 18.2.2.3.17 XMIType

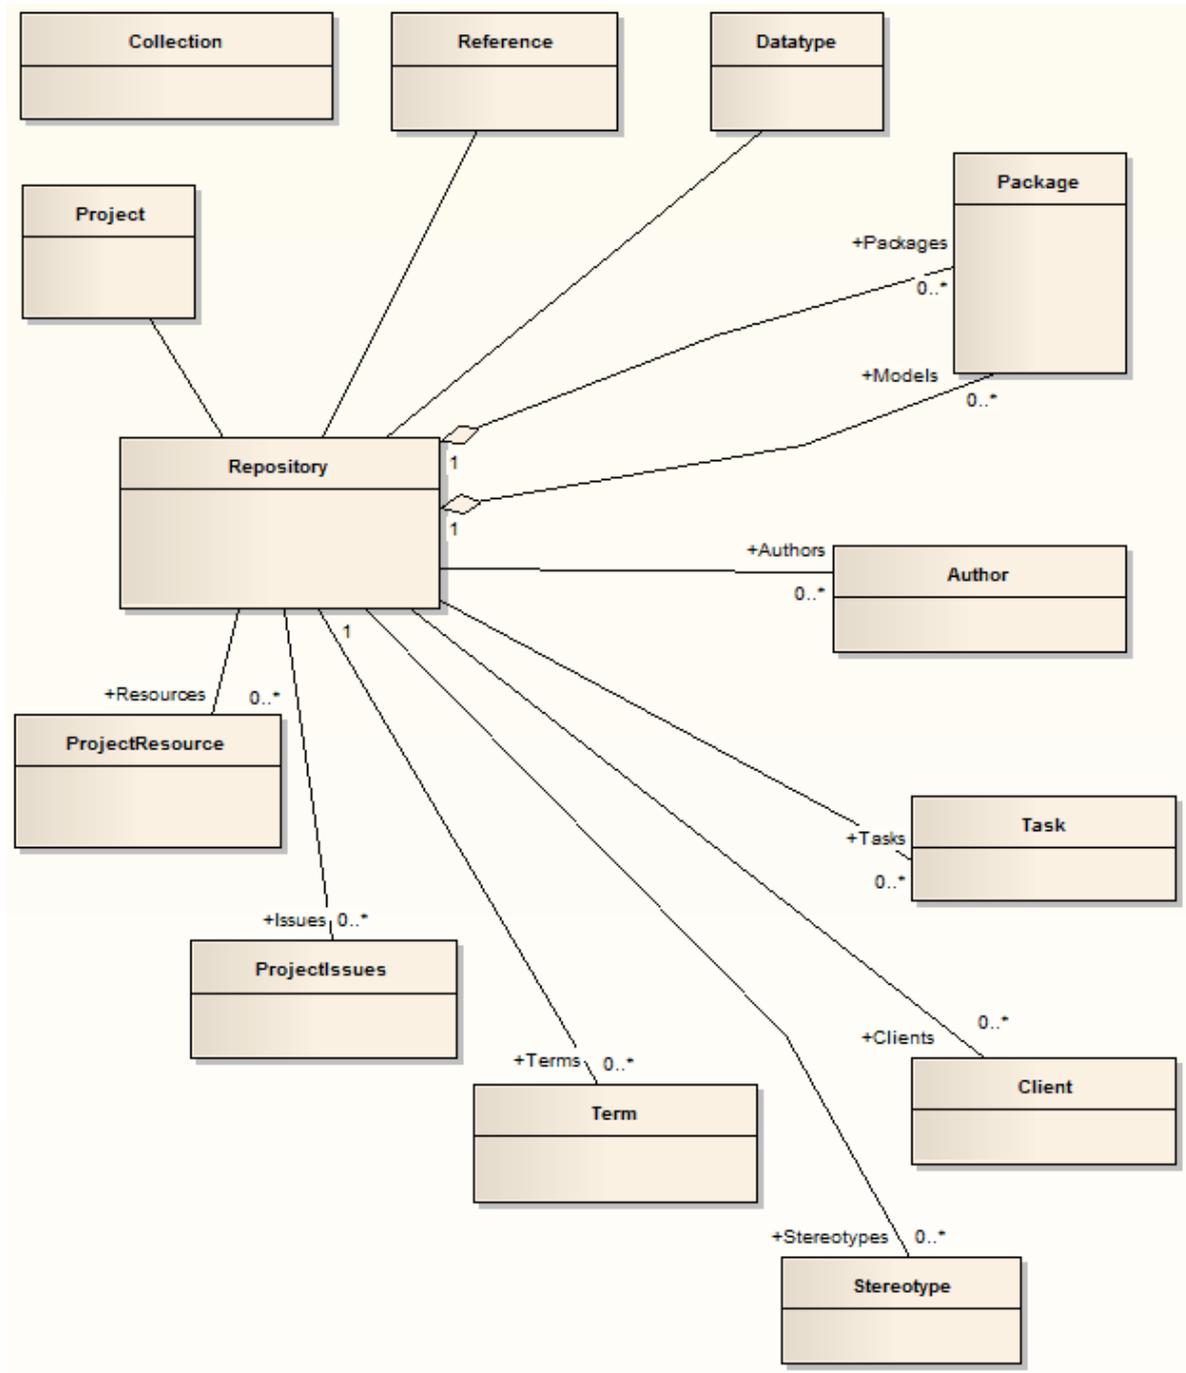

The following enumeration values are used in the *Project.ExportPackageXML()* method. They enable specification of the XML export type.

*xmiEADefault*  
*xmiRoseDefault*  
*xmiEA10*  
*xmiEA11*  
*xmiEA12*  
*xmiEA20*  
*xmiEA21*  
*xmiMOF13*  
*xmiMOF14*  
*xmiRose10*  
*xmiRose11*  
*xmiRose12*

## 18.2.2.4 Repository Package

The *Repository* package contains the high level system objects and entry point into the model itself using the *Models* collection and the other system level collections.

This diagram illustrates the **Repository** and its first level functions and collections.

#### Learn More:

- [Repository Class](#) 1855

#### 18.2.2.4.1 Author Class

An *Author* object represents a named model author. It can be accessed using the Repository *Authors* collection.

Associated table in .EAP file: *t\_authors*

Author Attributes

| Attribute  | Type                                 | Notes                                                                     |
|------------|--------------------------------------|---------------------------------------------------------------------------|
| Name       | String                               | Read/Write. Author name.                                                  |
| Notes      | String                               | Read/Write. Notes about the author.                                       |
| ObjectType | <a href="#">ObjectType</a><br>[1835] | Read only. Distinguishes objects referenced through a Dispatch interface. |
| Roles      | String                               | Read/Write. Roles the author might play in this project.                  |

Author Methods

| Method          | Type    | Notes                                                                                                                                                                                 |
|-----------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GetLastError () | String  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| Update ()       | Boolean | Updates the current Author object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.               |

**18.2.2.4.2 Client Class**

A Client represents one or more people or organizations related to the project. Accessed using the Repository *Clients* collection.

Associated table in .EAP file: *t\_clients*

Client Attributes

| Attribute    | Type                                 | Notes                                                                              |
|--------------|--------------------------------------|------------------------------------------------------------------------------------|
| EMail        | String                               | Read/Write. EMail address.                                                         |
| Fax          | String                               | Read/Write. Fax number.                                                            |
| Mobile       | String                               | Read/Write. Mobile phone if available.                                             |
| Name         | String                               | Read/Write. Client name.                                                           |
| Notes        | String                               | Read/Write. Notes about client.                                                    |
| ObjectType   | <a href="#">ObjectType</a><br>[1835] | Read only. Distinguishes objects referenced through the <i>Dispatch</i> interface. |
| Organization | String                               | Read/Write. Associated organization.                                               |
| Phone1       | String                               | Read/Write. Main phone number.                                                     |
| Phone2       | String                               | Read/Write. Second phone number.                                                   |

| Attribute | Type   | Notes                                                    |
|-----------|--------|----------------------------------------------------------|
| Roles     | String | Read/Write. Roles this client might play in the project. |

#### Client Methods

| Method          | Type    | Notes                                                                                                                                                                                 |
|-----------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GetLastError () | String  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| Update ()       | Boolean | Updates the current Client object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.               |

#### 18.2.2.4.3 Collection Class

| Topic         | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Link |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|
| General Usage | <p>This is the main collection Class used by all elements within the Automation Interface. It contains methods to iterate through the collection, refresh the collection and delete an item from the collection. It is important to realize that when <i>AddNew</i> is called, the item is not automatically added to the current collection. The typical steps are:</p> <ul style="list-style-type: none"> <li>• Call <i>AddNew</i> to add a new item</li> <li>• Modify the item as required</li> <li>• Call <i>Update</i> on the item to save it to the database</li> <li>• Call <i>Refresh</i> on the collection to include it in the current set</li> </ul> <p>Delete is much the same; until <i>Refresh</i> is called, the collection still contains a reference to the deleted item, which should not be called.</p> <p>Each can be used to iterate through the collection for languages that support this type of construct.</p> |      |

#### Collection Attributes

| Attribute  | Type                                                | Notes                                                                     |
|------------|-----------------------------------------------------|---------------------------------------------------------------------------|
| Count      | Short                                               | Read only. The number of objects referenced by this list.                 |
| ObjectType | <a href="#">ObjectType</a><br><small>[1835]</small> | Read only. Distinguishes objects referenced through a Dispatch interface. |

#### Collection Methods

| Method                                         | Type          | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | See Also                                                                                                                                                                                    |
|------------------------------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AddNew (string Name, string Type)</b>       | <i>Object</i> | <p>Adds a new item to the current collection.</p> <p>Note that the interface is the same for all collections; you must provide a <i>Name</i> and <i>Type</i> argument. What these are used for depends on the actual collection member. Also note that you must call <i>Update()</i> on the returned object to complete the <i>AddNew</i>. If <i>Update()</i> is not called the object is left in an indeterminate state.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• Name: String</li> <li>• Type: String (up to 30 characters long)</li> </ul> |                                                                                                                                                                                             |
| <b>Delete (short index)</b>                    | <i>Void</i>   | <p>Deletes the item at the selected reference.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• index: Short</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                             |
| <b>DeleteAt (short index, boolean Refresh)</b> | <i>Void</i>   | <p>Deletes the item at the selected index. The second parameter is currently unused.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• index: Short</li> <li>• Refresh: Boolean</li> </ul>                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                             |
| <b>GetAt (short index)</b>                     | <i>Object</i> | <p>Retrieves the array object using a numerical index. If the index is out of bounds, an error occurs.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• index: Short</li> </ul>                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                             |
| <b>GetByName (string Name)</b>                 | <i>Object</i> | <p>Gets an item in the current collection by Name.</p> <p>If the collection does not contain any items, the method returns a null value. If the collection contains items, but it was unable to find an object with the specified name, the method raises an exception.</p> <p>Only supported for the following collections: <b>Model</b>, <b>Package</b>, <b>Element</b>, <b>Diagram</b>, and element <b>TaggedValue</b>.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• Name: String</li> </ul>                                                   | <p><a href="#">Package Class</a><br/>[1845]</p> <p><a href="#">Element Class</a> [1877]</p> <p><a href="#">Diagram Class</a><br/>[1921]</p> <p><a href="#">TaggedValue Class</a> [1895]</p> |
| <b>GetLastError ()</b>                         | <i>String</i> | <p>Returns a string value describing the most recent error that occurred in relation to this object.</p> <p>This function is rarely used as an exception is thrown when an error occurs.</p>                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                             |
| <b>Refresh ()</b>                              | <i>Void</i>   | <p>Refreshes the collection by re-querying the model and reloading the collection. Should be called after adding a new item or after deleting an item.</p>                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                             |

#### 18.2.2.4.4 Datatype Class

A *Datatype* is a named type that can be associated with attribute or method types. It typically is related to either code engineering or database modeling. Datatypes also indicate which language or database system they relate to. Accessed using the Repository *Datatypes* collection.

Associated table in .EAP file: *t\_datatypes*

##### Datatype Attributes

| Attribute           | Type                                                | Notes                                                                                                                                                                                                                                       |
|---------------------|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DatatypeID</b>   | <i>Long</i>                                         | Read/Write. Instance ID for this datatype within the current model. System maintained.                                                                                                                                                      |
| <b>DefaultLen</b>   | <i>Long</i>                                         | Read/Write. Default length (DDL only).                                                                                                                                                                                                      |
| <b>DefaultPrec</b>  | <i>Long</i>                                         | Read/Write. Default precision (DDL only).                                                                                                                                                                                                   |
| <b>DefaultScale</b> | <i>Long</i>                                         | Read/Write. Default scale (DDL only).                                                                                                                                                                                                       |
| <b>GenericType</b>  | <i>String</i>                                       | Read/Write. The associated generic type for this data type.                                                                                                                                                                                 |
| <b>HasLength</b>    | <i>String</i>                                       | Read/Write. Indicates datatype has a length component.                                                                                                                                                                                      |
| <b>MaxLen</b>       | <i>Long</i>                                         | Read/Write. Maximum length (DDL only).                                                                                                                                                                                                      |
| <b>MaxPrec</b>      | <i>Long</i>                                         | Read/Write. Maximum precision (DDL only).                                                                                                                                                                                                   |
| <b>MaxScale</b>     | <i>Long</i>                                         | Read/Write. Maximum scale (DDL only).                                                                                                                                                                                                       |
| <b>Name</b>         | <i>String</i>                                       | Read/Write. The datatype name (such as <i>integer</i> ). This appears in the related drop-down datatype lists where appropriate.                                                                                                            |
| <b>ObjectType</b>   | <a href="#">ObjectType</a><br><small>[1835]</small> | Read only. Distinguishes objects referenced through a Dispatch interface.                                                                                                                                                                   |
| <b>Product</b>      | <i>String</i>                                       | Read/Write. The datatype product, such as Java, C++, Oracle.                                                                                                                                                                                |
| <b>Size</b>         | <i>Long</i>                                         | Read/Write. The datatype size.                                                                                                                                                                                                              |
| <b>Type</b>         | <i>String</i>                                       | Read/Write. The type can be <i>DDL</i> for database datatype or <i>Code</i> for language datatypes.                                                                                                                                         |
| <b>UserDefined</b>  | <i>Long</i>                                         | Read/Write. Indicates if datatype is a user defined type or system generated.<br><br>Datatypes distributed with Enterprise Architect are all system generated. Datatypes created in the <b>Datatype</b> dialog are marked <b>1 (true)</b> . |

##### Datatype Methods

| Method                 | Type          | Notes                                                                                                                                                                                 |
|------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i> | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |

| Method    | Type    | Notes                                                                                                                                                                        |
|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Update () | Boolean | Updates the current Datatype object after modification or appending a new item.<br>If <b>false</b> is returned, check the <i>GetLastError</i> function for more information. |

#### 18.2.2.4.5 EventProperties Class

An *EventProperties* object is passed to *BroadcastFunctions* to facilitate parameter passing.

##### EventProperties Attributes

| Attribute  | Type                                             | Notes                                                                     |
|------------|--------------------------------------------------|---------------------------------------------------------------------------|
| Count      | Long                                             | Read only. Number of parameters being passed to this broadcast event.     |
| ObjectType | <a href="#">ObjectType</a> <small>[1835]</small> | Read only. Distinguishes objects referenced through a Dispatch interface. |

##### EventProperties Methods

| Method             | Type                                                | Notes                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Get (object Index) | <a href="#">EventProperty</a> <small>[1844]</small> | Read only. Returns an <i>EventProperty</i> in the list, raising an error if <i>Index</i> is out of range.<br>Parameters: <ul style="list-style-type: none"> <li>Index: Variant - can either be a number representing a zero-based index into the array, or a string representing the name of the <i>EventProperty</i>. For example, <i>Props.Get(3)</i> or <i>Props.Get("ObjectID")</i>.</li> </ul> |

#### 18.2.2.4.6 EventProperty Class

*EventProperty* objects are always part of an **EventProperties** collection, and are passed to Add-In methods responding to **broadcast events**.

##### EventProperty Attributes

| Attribute   | Type                                             | Notes                                                                 |
|-------------|--------------------------------------------------|-----------------------------------------------------------------------|
| Description | String                                           | Explanation of what this property represents.                         |
| Name        | String                                           | A string distinguishing this property from others in the list.        |
| ObjectType  | <a href="#">ObjectType</a> <small>[1835]</small> | Distinguishes objects referenced through a Dispatch interface.        |
| Value       | Variant                                          | A string, number or object reference representing the property value. |

#### 18.2.2.4.7 ModelWatcher Class

The *ModelWatcher* object enables an automation client to track changes in a particular model.

##### ModelWatcher Attributes

| Attribute  | Type                                         | Notes                                                                     |
|------------|----------------------------------------------|---------------------------------------------------------------------------|
| ObjectType | <a href="#">ObjectType</a> <sup>[1835]</sup> | Read only. Distinguishes objects referenced through a Dispatch interface. |

##### ModelWatcher Methods

| Methods                               | Type                                         | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetReloadItem</b><br>(object Item) | <a href="#">ReloadType</a> <sup>[1837]</sup> | <p>The object that must be reloaded in order to see all changes is returned through the <i>Item</i> parameter. If there are no changes or the entire model must be reloaded, this value is returned as <b>null</b> (C#) or <b>Nothing</b> (VB).</p> <p>Calling this method clears the records so that the next time it is called the return values refer only to new changes. Returns a value from the <i>ReloadType</i> enumeration that specifies which type of change, if any, has occurred.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• Item: Object</li> </ul> |
| <b>PeekReloadItem</b>                 | <a href="#">ReloadType</a> <sup>[1837]</sup> | This method behaves identically to <i>GetReloadItem()</i> but does not clear the change record.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

##### Notes:

- After your model has been loaded, you only create the ModelWatcher once. If you **reload** the model, or load another model, the created ModelWatcher is still valid.

#### 18.2.2.4.8 Package Class

A *Package* object corresponds to a Package element in the Enterprise Architect Project Browser. It is accessed either through the *Repository Models* collection (a Model is a special form of Package) or through the Package *Packages* collection. Note that a Package has an Element object as an attribute; this corresponds to an Enterprise Architect Package element in the *t\_object* table and is used to associate additional information (such as scenarios and constraints) with the logical package. To set additional information for a package, reference the Element object directly. Also note that if you add a Package to a diagram, you should add an instance of the element (not the Package itself) to the *Diagram Object Class* for a diagram.

Associated table in .EAP file: *t\_package*

##### Package Attributes

| Attribute           | Type                                                | Notes                                                                                                                                                                |

| Alias               | String                                              | Read only<br>Alias                                                                                                                                                   |
| BatchLoad           | Long                                                | Read/Write<br>Flag to indicate that the package is batch loaded during batch import from controlled packages<br><b>Not currently used</b>                            |
| BatchSave           | Long                                                | Read/Write<br>Boolean value to indicate whether the package is included in the batch XML export list or not.                                                         |
| CodePath            | String                                              | Read/Write. The path to where associated source code is found. Not currently used.                                                                                   |
| Connectors          | <a href="#">Collection</a><br><small>[1841]</small> | Read only. Collection of connectors.                                                                                                                                 |
| Created             | Date                                                | Read/Write. Date the package was created.                                                                                                                            |
| Diagrams            | <a href="#">Collection</a><br><small>[1841]</small> | Read only. A collection of diagrams contained in this package.                                                                                                       |
| Element             | <a href="#">Element</a> <sup>[1877]</sup>           | Read only. The associated element object. Use to get/set common information such as Stereotype, Complexity, Alias, Author, Constraints, Tagged Values and Scenarios. |
| Elements            | <a href="#">Collection</a><br><small>[1841]</small> | Read only. A collection of elements that belong to this package.                                                                                                     |
| Flags               | String                                              | Read/Write. Extended information about the package.                                                                                                                  |
| IsControlled        | Boolean                                             | Read/Write. Indicates if the package has been marked as <i>Controlled</i> .                                                                                          |
| IsModel             | Boolean                                             | Read only. Indicates if the package is a model or a package.                                                                                                         |
| IsNamespace         | Boolean                                             | Read/Write. <b>True</b> is 'package is a Namespace root'. Use <b>0</b> and <b>1</b> to set <b>False</b> and <b>True</b> .                                            |
| IsProtected         | Boolean                                             | Read/Write. Indicates if the package has been marked as <i>Protected</i> .                                                                                           |
| IsVersionControlled | Boolean                                             | Read. Indicates whether or not this package is under version control.                                                                                                |
| LastLoadDate        | Date                                                | Read/Write. The date XML was last loaded for the package.                                                                                                            |
| LastSaveDate        | Date                                                | Read/Write. The date XML was last saved from the package.                                                                                                            |
| LogXML              | Boolean                                             | Read/Write. Indicates if XML export information is to be logged.                                                                                                     |
| Modified            | Date                                                | Read/Write. Date the package was last modified.                                                                                                                      |
| Name                | String                                              | Read/Write. The name of the package.                                                                                                                                 |
| Notes               | String                                              | Read/Write. Notes about this package.                                                                                                                                |
| ObjectType          | <a href="#">ObjectType</a><br><small>[1835]</small> | Read only. Distinguishes objects referenced through a Dispatch interface.                                                                                            |

| Attribute   | Type                                 | Notes                                                                                                                                     |
|-------------|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Owner       | String                               | Read/Write. The package owner when using controlled packages.                                                                             |
| PackageGUID | Variant                              | Read only. The global Package ID. Valid across models.                                                                                    |
| PackageID   | Long                                 | Read only. The local Package ID number. Valid only in this model file.                                                                    |
| Packages    | <a href="#">Collection</a><br>[1847] | Read only. A collection of contained packages that can be walked through.                                                                 |
| ParentID    | Long                                 | Read/Write. The ID of the package that is the parent of this one. 0 indicates this package is a <i>model</i> (that is, it has no parent). |
| TreePos     | Long                                 | Read/Write. The relative position in the tree compared to other packages (use to sort packages).                                          |
| UMLVersion  | String                               | Read/Write. The UML version for XML export purposes.                                                                                      |
| UseDTD      | Boolean                              | Read/Write. Indicates if a DTD is to be used when exporting XML.                                                                          |
| Version     | String                               | Read/Write. The version of the package.                                                                                                   |
| XMLPath     | String                               | Read/Write. The path to where the XML is saved when using controlled packages.                                                            |

### Package Methods

| Method                             | Type       | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ApplyGroupLock (string aGroupName) | Boolean    | Applies a group lock to the package object, for the specified group, on behalf of the current user.<br><br>Throws an exception if the operation fails. Use <i>GetLastError()</i> to retrieve error information.<br><br>Parameter: <ul style="list-style-type: none"> <li>aGroupName: String - The name of the security group for which to apply the lock.</li> </ul>                                                                    |
| ApplyUserLock ()                   | Boolean    | Applies a user lock to the package object for the current user.<br><br>Throws an exception if the operation fails. Use <i>GetLastError()</i> to retrieve error information.                                                                                                                                                                                                                                                             |
| Clone                              | LDISPATCH  | Inserts a copy of the package into the same parent as the original package.<br><br>Returns the newly-created package.                                                                                                                                                                                                                                                                                                                   |
| FindObject (string DottedID)       | LPDISPATCH | Returns a package, element, attribute or operation matching the parameter <i>DottedID</i> . If the <i>DottedID</i> is not found, an error is returned: <i>Can't find matching object</i> .<br><br>Parameter: <ul style="list-style-type: none"> <li>DottedID: String - Is in the form <i>object.object.object</i> where <i>object</i> is replaced by the name of a package, element attribute or operation. Examples include</li> </ul> |

| Method                                                                                               | Type           | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

#### 18.2.2.4.9 *ProjectIssues Class*

A system-level Issue. Indicates a problem or risk associated with the system as a whole. Accessed using the Repository *Issues* collection.

Associated table in .EAP file: *t\_issues*

#### ProjectIssues Attributes

| Attribute           | Type                                         | Notes                                                                     |
|---------------------|----------------------------------------------|---------------------------------------------------------------------------|
| <b>Category</b>     | <i>String</i>                                | Read/Write. The category this issue belongs to.                           |
| <b>Date</b>         | <i>Date</i>                                  | Read/Write. Date created.                                                 |
| <b>DateResolved</b> | <i>Date</i>                                  | Read/Write. Date issue resolved.                                          |
| <b>Name</b>         | <i>String</i>                                | Read/Write. Issue name (that is, the issue itself).                       |
| <b>IssueID</b>      | <i>Long</i>                                  | Read only. The ID of this issue.                                          |
| <b>Notes</b>        | <i>String</i>                                | Read/Write. Associated description of issue.                              |
| <b>ObjectType</b>   | <a href="#">ObjectType</a> <sup>[1835]</sup> | Read only. Distinguishes objects referenced through a Dispatch interface. |
| <b>Owner</b>        | <i>String</i>                                | Read/Write. Owner of issue.                                               |
| <b>Priority</b>     | <i>String</i>                                | Read/Write. Issue priority. Generally should use Low, Medium or High.     |
| <b>Resolution</b>   | <i>String</i>                                | Read/Write. Description of resolution.                                    |
| <b>Resolver</b>     | <i>String</i>                                | Read/Write. Person resolving issue.                                       |
| <b>Severity</b>     | <i>String</i>                                | Read/Write. Issue severity. Should be marked as Low, Medium or High.      |
| <b>Status</b>       | <i>String</i>                                | Read/Write. Current issue status.                                         |

#### ProjectIssues Methods

| Method                 | Type           | Notes                                                                                                                                                                                 |
|------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| <b>Update ()</b>       | <i>Boolean</i> | Update the current Issue object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.                 |

#### 18.2.2.4.10 ProjectResource Class

A *Project Resource* is a named person who is available to work on the current project in any capacity. Accessed using the Repository *Resources* collection.

Associated table in .EAP file: *t\_resources*

#### ProjectResource Attributes

| Attribute           | Type                                                         | Notes                                                                     |
|---------------------|--------------------------------------------------------------|---------------------------------------------------------------------------|
| <b>Email</b>        | <i>String</i>                                                | Email address.                                                            |
| <b>Fax</b>          | <i>String</i>                                                | Fax number.                                                               |
| <b>Mobile</b>       | <i>Variant</i>                                               | Mobile number if available.                                               |
| <b>Name</b>         | <i>String</i>                                                | Name of resource.                                                         |
| <b>Notes</b>        | <i>String</i>                                                | A description if appropriate.                                             |
| <b>ObjectType</b>   | <a href="#">ObjectType</a> <sup>[1835]</sup>                 | Read only. Distinguishes objects referenced through a Dispatch interface. |
| <b>Organization</b> | <a href="#">Package</a> <sup>[1845]</sup> :<br><i>String</i> | Organization resource associated with.                                    |
| <b>Phone1</b>       | <i>Variant</i>                                               | Main phone.                                                               |
| <b>Phone2</b>       | <i>Variant</i>                                               | Alternative phone.                                                        |
| <b>Roles</b>        | <i>String</i>                                                | The roles this resource can play in the current project.                  |

#### ProjectResource Methods

| Method                 | Type           | Notes                                                                                                                                                                                 |
|------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| <b>Update ()</b>       | <i>Boolean</i> | Update the current Resource object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more                           |

| Method | Type | Notes        |
|--------|------|--------------|
|        |      | information. |

#### 18.2.2.4.11 ProjectRole Class

A *ProjectRole* object represents a named project role. Accessed using the Repository *ProjectRole* collection.

Associated table in .EAP file: *t\_projectroles*

##### ProjectRole Attributes

| Attribute   | Type                                 | Notes                                                                     |
|-------------|--------------------------------------|---------------------------------------------------------------------------|
| Description | String                               | Read/Write. The project role item description.                            |
| Notes       | String                               | Read/Write. Notes about the project role item.                            |
| ObjectType  | <a href="#">ObjectType</a><br>[1835] | Read only. Distinguishes objects referenced through a Dispatch interface. |
| Role        | String                               | Read/Write. The project role item name.                                   |

##### ProjectRole Methods

| Method          | Type    | Notes                                                                                                                                                                                 |
|-----------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GetLastError () | String  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| Update ()       | Boolean | Updates the current ProjectRole object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.          |

#### 18.2.2.4.12 PropertyType Class

A *PropertyType* object represents a defined property that can be applied to UML elements as a Tagged Value. Accessed using the Repository *PropertyTypes* collection. Each *PropertyType* corresponds to one of the predefined Tagged Values for the model.

Associated table in .EAP file: *t\_propertytypes*

##### Author Attributes

| Attribute   | Type                                 | Notes                                                          |
|-------------|--------------------------------------|----------------------------------------------------------------|
| Description | String                               | Read/Write. Short description for the property.                |
| Detail      | String                               | Read/Write. Configuration information for the property.        |
| ObjectType  | <a href="#">ObjectType</a><br>[1835] | Read only. Distinguishes objects referenced through a Dispatch |

| Attribute  | Type          | Notes                                        |
|------------|---------------|----------------------------------------------|
|            |               | interface.                                   |
| <b>Tag</b> | <i>String</i> | Read/Write. Name of the property (Tag Name). |

#### Author Methods

| Method                 | Type           | Notes                                                                                                                                                                                 |
|------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| <b>Update ()</b>       | <i>Boolean</i> | Update the current <i>PropertyType</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.   |

#### 18.2.2.4.13 Reference Class

This Interface provides access to the various lookup tables within Enterprise Architect. Use the Repository *GetReferenceList()* method to get a handle to a list. Valid lists are:

- Diagram
- Element
- Constraint
- Requirement
- Connector
- Status
- Cardinality
- Effort
- Metric
- Scenario
- Status
- Test

#### Reference Attributes

| Attribute         | Type                                                | Notes                                                                     |
|-------------------|-----------------------------------------------------|---------------------------------------------------------------------------|
| <b>Count</b>      | <i>Short</i>                                        | Count of items in the list.                                               |
| <b>ObjectType</b> | <a href="#">ObjectType</a><br><small>[1835]</small> | Read only. Distinguishes objects referenced through a Dispatch interface. |
| <b>Type</b>       | <i>String</i>                                       | The list type (for example, DiagramTypes).                                |

#### Reference Methods

| Method                     | Type          | Notes                                                                                                                                                                                 |
|----------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetAt (short Index)</b> | <i>String</i> | Get the item at the specified index.<br>Parameters:<br><ul style="list-style-type: none"> <li>Index: Short - The index of the item to retrieve from the list.</li> </ul>              |
| <b>GetLastError ()</b>     | <i>String</i> | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| <b>Refresh ()</b>          | <i>Short</i>  | Refresh the current list and return the count of items.                                                                                                                               |

#### 18.2.2.4.14 Repository Class

The *Repository* is the main container of all structures such as models, packages and elements. You can iteratively begin accessing the model using the *Models* collection. It also has some convenient methods to directly access the structures without having to locate them in the hierarchy first.

Associated table in .EAP file: <none>

#### Repository Attributes:

| Attribute               | Type                                                     | Notes                                                                                                                                                                                                                                                                                                                        | See Also |
|-------------------------|----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| <b>Authors</b>          | <a href="#">Collection</a><br><small>[1841]</small>      | Read only. The system <i>Authors</i> collection. Contains 0 or more <i>Author objects</i> , each of which can be associated with, for example, elements or diagrams as the item author or owner. Use <i>AddNew</i> , <i>Delete</i> and <i>GetAt</i> to manage Authors.                                                       |          |
| <b>BatchAppend</b>      | <i>Boolean</i>                                           | Read/Write. Set this property to <b>true</b> when your automation client has to rapidly insert many elements, operations, attributes and/or operation parameters. Set to <b>false</b> when work is complete.<br><br>This can result in 10- to 20-fold improvement in adding new elements in bulk.                            |          |
| <b>Clients</b>          | <a href="#">Collection</a><br><small>[1841]</small>      | Read only. A list of <i>Clients</i> associated with the project. You can modify, delete and add new <i>Client objects</i> using this collection.                                                                                                                                                                             |          |
| <b>ConnectionString</b> | <i>String</i>                                            | Read only. The filename/connection string of the current Repository.                                                                                                                                                                                                                                                         |          |
| <b>Datatypes</b>        | <a href="#">Collection</a><br><small>[1841]</small>      | Read only. The <i>Datatypes</i> collection. Contains a list of <i>Datatype objects</i> , each representing a data type definition for either data modeling or code generation purposes.                                                                                                                                      |          |
| <b>EAEdition</b>        | <a href="#">EAEdition Types</a><br><small>[1833]</small> | Read only. Returns the current level of core licensed functionality available<br><br>This property returns <b>Corporate</b> when the edition is <i>Business and Software Engineering</i> , <i>Systems Engineering</i> or <i>Ultimate</i> . Use <b>EAEditionEx</b> to identify which of these extended editions is available. |          |

| Attribute         | Type                                                                                                 | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | See Also                                              |

| EAEditionEx       | <a href="#">EAEditionTypes</a> <sup>[1833]</sup>                                                     | Read only. Returns the current level of extended licensed functionality available                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                       |
| EnableCache       | Boolean                                                                                              | Read/Write. An optimization for pre-loading package objects when dealing with large sets of automation objects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                       |
| EnableUIUpdates   | Boolean                                                                                              | Read/Write. Set this property to <b>false</b> to improve the performance of changes to the model; for example, bulk addition of elements to a package. To reveal the changes to the user, call <i>Repository.RefreshModelView()</i> .                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                       |
| FlagUpdate        | Boolean                                                                                              | Read/Write. Instructs Enterprise Architect to update the Repository with the <i>LastUpdate</i> value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                       |
| InstanceGUID      | String                                                                                               | Read only. The identifier string identifying the Enterprise Architect runtime session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                       |
| IsSecurityEnabled | Boolean                                                                                              | Read only. Checks whether User Security is enabled for the current repository.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                       |
| Issues            | <a href="#">Collection</a> <sup>[1841]</sup>                                                         | Read only. The <i>System Issues</i> list. Contains <i>ProjectIssues</i> objects, each detailing a particular issue as it relates to the project as a whole.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                       |
| LastUpdate        | String                                                                                               | Read only. The identifier string identifying the Enterprise Architect runtime session and the timestamp for when it was set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                       |
| LibraryVersion    | Long                                                                                                 | Read only. The build number of the Enterprise Architect runtime.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                       |
| Models            | <a href="#">Collection</a> <sup>[1841]</sup><br>of type<br><a href="#">Package</a> <sup>[1845]</sup> | <p>Read only. <i>Models</i> are of type <i>package</i> and belong to a collection of packages. This is the top level entry point to an Enterprise Architect project file. Each model is a <i>root node</i> in the <b>Project Browser</b> and can contain items such as Views and packages.</p> <p>A model is a special form of a package; it has a <i>ParentID</i> of <b>0</b>. By iterating through all models, you can access all the elements within the project hierarchy.</p> <p>You can also use the <i>AddNew</i> function to create a new model. A model can be deleted, but remember that everything contained in the model is deleted as well.</p> |                                                       |
| ObjectType        | <a href="#">ObjectType</a> <sup>[1835]</sup>                                                         | Read only. Distinguishes objects referenced through the Dispatch interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                       |
| ProjectGUID       | String                                                                                               | Read only. Returns a unique ID for the project.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                       |
| ProjectRoles      | <a href="#">Collection</a> <sup>[1841]</sup>                                                         | Read only. The system Roles collection. Contains <b>0</b> or more Role objects, each of which can be associated with, for example, elements or diagrams as the item author or owner. Use <i>AddNew</i> , <i>Delete</i> and <i>GetAt</i> to manage Roles                                                                                                                                                                                                                                                                                                                                                                                                      |                                                       |
| PropertyTypes     | <a href="#">Collection</a> <sup>[1841]</sup>                                                         | Read only. Collection of <b>Property Types</b> available to the Repository.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <a href="#">Property Type Class</a> <sup>[1853]</sup> |

#### 18.2.2.4.15 Stereotype Class

The *Stereotype* element corresponds to a UML stereotype, which is an extension mechanism for varying the behavior and type of a model element. Use the Repository *Stereotypes* collection to add new elements and delete existing ones.

Associated table in .EAP file: *t\_stereotypes*

#### Stereotype Attributes

| Attribute               | Type                                         | Notes                                                                                                                                                                                                                  |
|-------------------------|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AppliesTo</b>        | <i>String</i>                                | Read/Write. A reference to the stereotype <i>Base Class</i> , that is, which element it applies to.                                                                                                                    |
| <b>MetafileLoadPath</b> | <i>String</i>                                | Read/Write. Path to an associated metafile. The automation interface does not yet support loading metafiles. To do this you must use the <b>Stereotype</b> tab of the <b>UML Types</b> dialog in Enterprise Architect. |
| <b>Notes</b>            | <i>String</i>                                | Read/Write. Notes about the stereotype.                                                                                                                                                                                |
| <b>Name</b>             | <i>String</i>                                | Read/Write. The stereotype name. Appears in the <b>Stereotype</b> drop list for elements that match the <i>AppliesTo</i> attribute.                                                                                    |
| <b>ObjectType</b>       | <a href="#">ObjectType</a> <sup>[1835]</sup> | Read only. Distinguishes objects referenced through a Dispatch interface.                                                                                                                                              |
| <b>StereotypeGUID</b>   | <i>String</i>                                | Read/Write. Unique identifier for stereotype, generally set and maintained by Enterprise Architect.                                                                                                                    |
| <b>Style</b>            | <i>String</i>                                | Read/Write. Additional style specifier for stereotype.                                                                                                                                                                 |
| <b>VisualType</b>       | <i>String</i>                                | Read/Write. Indicates an inbuilt visual style associated with a stereotype. Not currently implemented.                                                                                                                 |

#### Stereotype Methods

| Method                 | Type          | Notes                                                                                                                                                                         |
|------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i> | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error |

| Method           | Type           | Notes                                                                                                                                                                      |
|------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  |                | occurs.                                                                                                                                                                    |
| <b>Update ()</b> | <i>Boolean</i> | Update the current stereotype object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information. |

#### 18.2.2.4.16 Task Class

A Task is an entry in the System ToDo list. Accessed using the Repository *Tasks* collection.

Associated table in .EAP file: *t\_tasks*

#### Task Attributes

| Attribute         | Type                                 | Notes                                                                                       |
|-------------------|--------------------------------------|---------------------------------------------------------------------------------------------|
| <b>ActualTime</b> | <i>Long</i>                          | Read/Write. Time already expended on task, in hours, days or other units.                   |
| <b>AssignedTo</b> | <i>String</i>                        | Read/Write. Person this task is assigned to; that is, the responsible resource.             |
| <b>EndDate</b>    | <i>Date</i>                          | Read/Write. Date task scheduled to finish.                                                  |
| <b>History</b>    | <i>String</i>                        | Read/Write. Memo field to hold, for example, task history or notes.                         |
| <b>Name</b>       | <i>Variant</i>                       | Read/Write. Task name.                                                                      |
| <b>Notes</b>      | <i>Variant</i>                       | Read/Write. Description of the task.                                                        |
| <b>ObjectType</b> | <a href="#">ObjectType</a><br>[1835] | Read only. Distinguishes objects referenced through a Dispatch interface.                   |
| <b>Owner</b>      | <i>String</i>                        | Read/Write. The task owner.                                                                 |
| <b>Percent</b>    | <i>Long</i>                          | Read/Write. Percent the task is complete.                                                   |
| <b>Phase</b>      | <i>String</i>                        | Read/Write. The phase of the project the task relates to.                                   |
| <b>Priority</b>   | <i>String</i>                        | Read/Write. Priority associated with this task.                                             |
| <b>StartDate</b>  | <i>Date</i>                          | Read/Write. Date task is to start.                                                          |
| <b>Status</b>     | <i>Variant</i>                       | Read/Write. Current task status.                                                            |
| <b>TaskID</b>     | <i>Long</i>                          | Read only. Local ID of task.                                                                |
| <b>TotalTime</b>  | <i>Long</i>                          | Read/Write. The total expected time the task might run - in hours, days or some other unit. |
| <b>Type</b>       | <i>String</i>                        | Read/Write. Sets or returns string representing the type.                                   |

#### Task Methods

| Method                 | Type           | Notes                                                                                                                                                                                 |
|------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| <b>Update ()</b>       | <i>Boolean</i> | Update the current Task object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.                  |

#### 18.2.2.4.17 Term Class

A *Term* object represents one entry in the system glossary. Accessed using the Repository *Terms* collection.

Associated table in .EAP file: *t\_glossary*

#### Term Attributes

| Attribute         | Type                                 | Notes                                                                           |
|-------------------|--------------------------------------|---------------------------------------------------------------------------------|
| <b>Meaning</b>    | <i>String</i>                        | Read/Write. The description of the term; its meaning.                           |
| <b>ObjectType</b> | <a href="#">ObjectType</a><br>[1835] | Read only. Distinguishes objects referenced through a Dispatch interface.       |
| <b>Term</b>       | <i>String</i>                        | Read/Write. The glossary item name.                                             |
| <b>TermID</b>     | <i>Long</i>                          | Read only. A local ID number to identify the term in the model.                 |
| <b>Type</b>       | <i>String</i>                        | Read/Write. The type this term applies to (for example, business or technical). |

#### Term Methods

| Method                 | Type           | Notes                                                                                                                                                                                 |
|------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| <b>Update ()</b>       | <i>Boolean</i> | Update the current Term object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.                  |

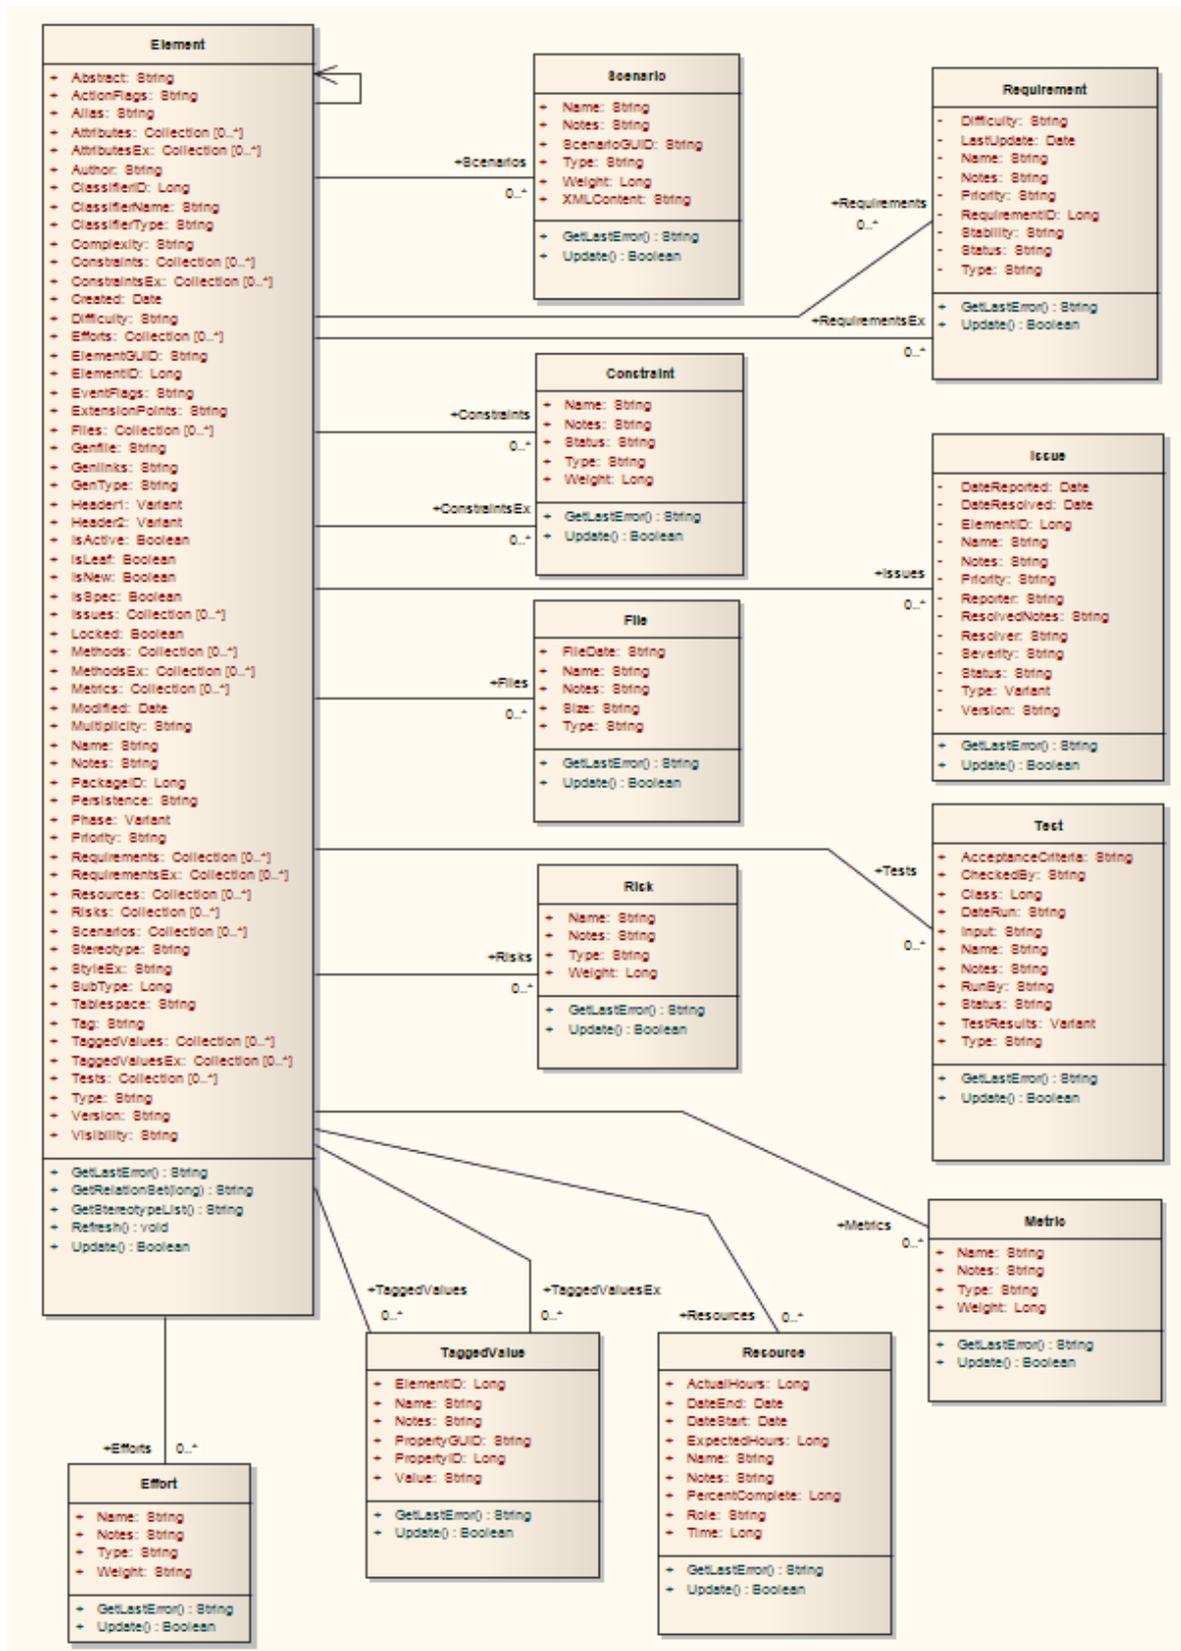

#### 18.2.2.5 Element Package

The *Element* package contains information about an element and its associated extended properties such as testing and project management information. An element is the basic item in an Enterprise Architect model. Classes, Use Cases and Components are all different types of UML element.

The diagram below illustrates the relationships between an *element* and its associated extended information. The related information is accessed through the collections owned by the element (for example, Scenarios and Tests). It also includes a full description of the element object (the basic model structural

unit).

**Example:**

### 18.2.2.5.1 Constraint Class

A *Constraint* is a condition imposed on an element. Constraints are accessed through the Element *Constraints* collection.

Associated table in .EAP file: *t\_objectconstraints*

#### Constraint Attributes

| Attribute         | Type                                 | Notes                                                                            |
|-------------------|--------------------------------------|----------------------------------------------------------------------------------|
| <b>Name</b>       | <i>String</i>                        | Read/Write. The name of the constraint (that is, the constraint).                |
| <b>Notes</b>      | <i>String</i>                        | Read/Write. Notes about the constraint.                                          |
| <b>ObjectType</b> | <a href="#">ObjectType</a><br>[1835] | Read only. Distinguishes objects referenced through a Dispatch interface.        |
| <b>ParentID</b>   | <i>Long</i>                          | Read only. The <i>ElementID</i> of the element to which this constraint applies. |
| <b>Status</b>     | <i>String</i>                        | Read/Write. Current status.                                                      |
| <b>Type</b>       | <i>String</i>                        | Read/Write. Constraint type.                                                     |
| <b>Weight</b>     | <i>Long</i>                          | Read/Write. A weighting factor.                                                  |

#### Constraint Methods

| Method                 | Type           | Notes                                                                                                                                                                                 |
|------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| <b>Update ()</b>       | <i>Boolean</i> | Update the current <i>Constraint</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.     |

### 18.2.2.5.2 Effort Class

An *Effort* is a named item with a weighting that can be associated with an element for purposes of building metrics about the model. Accessed through the Element *Efforts* collection.

Associated table in .EAP file: *t\_objecteffort*

#### Effort Attributes

| Attribute    | Type          | Notes                               |
|--------------|---------------|-------------------------------------|
| <b>Name</b>  | <i>String</i> | Read/Write. The name of the effort. |
| <b>Notes</b> | <i>String</i> | Read/Write. Notes about the effort. |

| Attribute         | Type                                              | Notes                                                                     |
|-------------------|---------------------------------------------------|---------------------------------------------------------------------------|
| <b>ObjectType</b> | <a href="#">ObjectType</a><br><small>1835</small> | Read only. Distinguishes objects referenced through a Dispatch interface. |
| <b>Type</b>       | <i>String</i>                                     | Read/Write. The effort type.                                              |
| <b>Weight</b>     | <i>Long</i>                                       | Read/Write. A weighting factor.                                           |
| <b>Weight2</b>    | <i>Float</i>                                      | Read/Write. A weighting factor.                                           |

#### Effort Methods

| Method                 | Type           | Notes                                                                                                                                                                                 |
|------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| <b>Update ()</b>       | <i>Boolean</i> | Saves the effort to the model.                                                                                                                                                        |

#### 18.2.2.5.3 Element Class

An *Element* is the main modeling unit. It corresponds to (for example) Class, Use Case, Node or Component. You create new elements by adding to the Package *Elements* collection. Once you have created an element, you can add it to the *DiagramObject* Class of a diagram to include it in the diagram.

Elements also have a collection of connectors. Each entry in this collection indicates a relationship to another element.

There are also some extended collections for managing additional information about the element, including things such as Tagged Values, Issues, Constraints and Requirements.

Associated table in .EAP file: *t\_object*

#### Element Attributes

| Attribute                          | Type          | Notes                                                                                               | See Also                                                                           |
|------------------------------------|---------------|-----------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| <b>Abstract</b>                    | <i>String</i> | Read/Write<br>Indicates if the element is Abstract (1) or Concrete (0)                              |                                                                                    |
| <b>ActionFlags</b>                 | <i>String</i> | Read/Write<br>A structure to hold flags concerned with Action semantics                             |                                                                                    |
| <b>Alias</b>                       | <i>String</i> | Read/Write<br>An optional alias for this element                                                    |                                                                                    |
| <b>AssociationClassConnectorID</b> | <i>Long</i>   | Read only<br>If the element is an AssociationClass, <i>AssociationClassConnectorID</i> contains the | <a href="#">CreateAssociationClass()</a><br><small>1885</small><br>(Information on |

#### 18.2.2.5.4 File Class

##### public Class

A *File* represents an associated file for an element. It is accessed through the Element *Files* collection.

Associated table in .EAP file: *t\_objectfiles*

##### File Attributes

| Attribute         | Type                                             | Notes                                                                                                    |
|-------------------|--------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>FileDate</b>   | <i>String</i>                                    | Read/Write. The file date when entry is created.                                                         |
| <b>Name</b>       | <i>String</i>                                    | Read/Write. The file name can be a logical file or a reference to a web address (using <i>http://</i> ). |
| <b>Notes</b>      | <i>String</i>                                    | Read/Write. Notes about the file.                                                                        |
| <b>ObjectType</b> | <a href="#">ObjectType</a> <small>[1835]</small> | Read only. Distinguishes objects referenced through a Dispatch interface.                                |

| Attribute | Type   | Notes                      |
|-----------|--------|----------------------------|
| Size      | String | Read/Write. The file size. |
| Type      | String | Read/Write. File type.     |

#### File Methods

| Method          | Type    | Notes                                                                                                                                                                                 |
|-----------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GetLastError () | String  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| Update ()       | Boolean | Update the current File object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.                  |

#### 18.2.2.5.5 Issue (Maintenance) Class

An *Issue* is either a *Change* or a *Defect*, is associated with the containing element, and is accessed through the *Issues* collection of an element.

Associated table in .EAP file: *t\_objectproblems*

#### Issue Attributes

| Attribute     | Type                                                | Notes                                                                                                                         |
|---------------|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| DateReported  | Date                                                | Read/Write. Date issue reported.                                                                                              |
| DateResolved  | Date                                                | Read/Write. Date issue resolved.                                                                                              |
| ElementID     | Long                                                | Read/Write. ID of element associated with this issue.                                                                         |
| Name          | String                                              | Read/Write. The Issue name; that is, the Issue itself.                                                                        |
| Notes         | String                                              | Read/Write. Issue description.                                                                                                |
| ObjectType    | <a href="#">ObjectType</a><br><small>[1835]</small> | Read only. Distinguishes objects referenced through a Dispatch interface.                                                     |
| Priority      | String                                              | Read/Write. Issue priority. Generally should use <b>Low</b> , <b>Medium</b> and <b>High</b> .                                 |
| Reporter      | String                                              | Read/Write. Person reporting issue.                                                                                           |
| Resolver      | String                                              | Read/Write. Person resolving issue.                                                                                           |
| ResolverNotes | String                                              | Read/Write. Notes entered by resolver about resolution.                                                                       |
| Severity      | String                                              | Read/Write. Issue severity. Should be marked as <b>Low</b> , <b>Medium</b> or <b>High</b> .                                   |
| Status        | String                                              | Read/Write. The current status of the issue.                                                                                  |
| Type          | Variant                                             | Read/Write. Issue type - can be <b>Defect</b> or <b>Change</b> , <b>Issue</b> and <b>ToDo</b> .                               |
| Version       | String                                              | Read/Write. Version associated with issue. Note that this method is only available through a Dispatch interface. For example: |

| Attribute | Type | Notes                                   |
|-----------|------|-----------------------------------------|
|           |      | Object ob = Issue;<br>Print ob.Version; |

#### Issue Methods

| Method                 | Type           | Notes                                                                                                                                                                                 |
|------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| <b>Update ()</b>       | <i>Boolean</i> | Update the current Issue object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.                 |

#### 18.2.2.5.6 Metric Class

A *Metric* is a named item with a weighting that can be associated with an element for purposes of building metrics about the model. Accessed through the Element *Metrics* collection.

Associated table in .EAP file: *t\_objectmetrics*

#### Metric Attributes

| Attribute         | Type                                                | Notes                                                                     |
|-------------------|-----------------------------------------------------|---------------------------------------------------------------------------|
| <b>Name</b>       | <i>String</i>                                       | Read/Write. The name of the metric.                                       |
| <b>Notes</b>      | <i>String</i>                                       | Read/Write. Notes about this metric.                                      |
| <b>ObjectType</b> | <a href="#">ObjectType</a><br><small>[1835]</small> | Read only. Distinguishes objects referenced through a Dispatch interface. |
| <b>Type</b>       | <i>String</i>                                       | Read/Write. The metric type.                                              |
| <b>Weight</b>     | <i>Long</i>                                         | Read/Write. A user defined weighting for estimation or metric purposes.   |

#### Metric Methods

| Method                 | Type           | Notes                                                                                                                                                                                 |
|------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| <b>Update ()</b>       | <i>Boolean</i> | Update the current Metric object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.                |

### 18.2.2.5.7 Requirement Class

An *Element Requirement* object holds information about the responsibilities of an element in the context of the model. Accessed using the *Element Requirements* collection.

Associated table in .EAP file: *t\_objectrequires*

#### Requirement Attributes

| Attribute     | Type                                 | Notes                                                                                                                                                                                                                                            |
|---------------|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Difficulty    | String                               | Read/Write. Estimated difficulty to implement.                                                                                                                                                                                                   |
| LastUpdate    | Date                                 | Read/Write. Date requirement last updated.                                                                                                                                                                                                       |
| Name          | String                               | Read/Write. The requirement itself.                                                                                                                                                                                                              |
| Notes         | String                               | Read/Write. Further notes about requirement.                                                                                                                                                                                                     |
| ObjectType    | <a href="#">ObjectType</a><br>[1835] | Read only. Distinguishes objects referenced through a Dispatch interface.                                                                                                                                                                        |
| ParentID      | Long                                 | Read only. The <i>ElementID</i> of the element to which this requirement applies.                                                                                                                                                                |
| Priority      | String                               | Read/Write. Assigned priority of the requirement.                                                                                                                                                                                                |
| RequirementID | Long                                 | Read only. A local ID for this requirement.                                                                                                                                                                                                      |
| Stability     | String                               | Read/Write. Estimated stability of the requirement.<br><br>This is an indication of the probability of the requirement - or understanding of the requirement - changing. High stability indicates a low probability of the requirement changing. |
| Status        | String                               | Read/Write. Current status of the requirement.                                                                                                                                                                                                   |
| Type          | String                               | Read/Write. Requirement type.                                                                                                                                                                                                                    |

#### Requirement Methods

| Method          | Type    | Notes                                                                                                                                                                                 |
|-----------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GetLastError () | String  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| Update ()       | Boolean | Update the current Requirement object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.           |

### 18.2.2.5.8 Resource Class

An Element *Resource* is a named person/task pair with timing constraints and percent complete indicators. Use this to manage the work associated with delivering an Element.

Associated table in .EAP file: *t\_objectresources*

#### Resource Attributes

| Attribute       | Type                                 | Notes                                                                                  |
|-----------------|--------------------------------------|----------------------------------------------------------------------------------------|
| ActualHours     | Long                                 | Read/Write. Time already expended on the task, in hours, days or other units.          |
| DateEnd         | Date                                 | Read/Write. Expected end date.                                                         |
| DateStart       | Date                                 | Read/Write. Date to start work.                                                        |
| ExpectedHours   | Long                                 | Read/Write. The total expected time the task might run, in hours, days or other units. |
| History         | String                               | Read/Write. Gets or sets history text.                                                 |
| Name            | String                               | Read/Write. Name of resource (for example, person's name).                             |
| Notes           | String                               | Read/Write. Descriptive notes.                                                         |
| ObjectType      | <a href="#">ObjectType</a><br>[1835] | Read only. Distinguishes objects referenced through a Dispatch interface.              |
| PercentComplete | Long                                 | Read/Write. Current percent complete figure.                                           |
| Role            | String                               | Read/Write. Role they play in implementing the element.                                |
| Time            | Long                                 | Read/Write. Time expected; numeric indicating number of days.                          |

#### Resource Methods

| Method          | Type    | Notes                                                                                                                                                                                 |
|-----------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GetLastError () | String  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| Update ()       | Boolean | Update the current Resource object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.              |

### 18.2.2.5.9 Risk Class

A *Risk* object represents a named risk associated with an element and is used for project management purposes. Accessed through the Element *Risks* collection.

Associated table in .EAP file: *t\_objectrisks*

Risk Attributes

| Attribute  | Type                                                | Notes                                                                     |
|------------|-----------------------------------------------------|---------------------------------------------------------------------------|
| Name       | String                                              | Read/Write. The risk.                                                     |
| Notes      | String                                              | Read/Write. Further notes describing the risk.                            |
| ObjectType | <a href="#">ObjectType</a><br><small>[1835]</small> | Read only. Distinguishes objects referenced through a Dispatch interface. |
| Type       | String                                              | Read/Write. The risk type associated with this element.                   |
| Weight     | Long                                                | Read/Write. A weighting for estimation or metric purposes.                |

Risk Methods

| Method          | Type    | Notes                                                                                                                                                                                 |
|-----------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GetLastError () | String  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| Update ()       | Boolean | Update the current Risk object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.                  |

**18.2.2.5.10 Scenario Class**

A *Scenario* corresponds to a Collaboration or Use Case instance. Each Scenario is a path of execution through the logic of a Use Case. Scenarios can be added to using the Element *Scenarios* collection.

Associated table in .EAP file: *t\_objectscenarios*

Scenario Attributes

| Attribute    | Type                                                                | Notes                                                                                                                                                                                                   | See Also                                                  |
|--------------|---------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
| Name         | String                                                              | Read/Write. The Scenario name.                                                                                                                                                                          |                                                           |
| Notes        | String                                                              | Read/Write. Description of the Scenario. Usually contains the steps to execute the scenario.                                                                                                            |                                                           |
| ObjectType   | <a href="#">ObjectType</a><br><small>[1835]</small>                 | Read only. Distinguishes objects referenced through a Dispatch interface.                                                                                                                               |                                                           |
| ScenarioGUID | String                                                              | Read/Write. A unique ID for the Scenario. Used to identify the Scenario unambiguously within a model.                                                                                                   |                                                           |
| Steps        | Collection of <a href="#">ScenarioStep</a><br><small>[1894]</small> | Read only. A collection of step objects for this Scenario. Use the <b>AddNew</b> and <i>Delete</i> functions to manage steps. <i>AddNew</i> passes the step name and "1" as the type for an actor step. | <a href="#">Collection Class</a><br><small>[1841]</small> |
| Type         | String                                                              | Read/Write. The scenario type (for example, <i>Basic Path</i> ).                                                                                                                                        |                                                           |

| Attribute  | Type   | Notes                                                                                                                                                                    | See Also |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| Weight     | Long   | Read/Write. Currently used to position scenarios in the scenario list (that is, <i>List Position</i> ).                                                                  |          |
| XMLContent | String | Read/Write. A structured field that can contain scenario details in XML format. It is recommended that you use the <b>Steps</b> collection to read or modify this field. |          |

### Scenario Methods

| Method          | Type    | Notes                                                                                                                                                                                 |
|-----------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GetLastError () | String  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| Update ()       | Boolean | Update the current Scenario object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.              |

#### 18.2.2.5.11 ScenarioExtension Class

### ScenarioExtension Attributes

| Attribute     | Type                                                  | Notes                                                                                                                                                      |
|---------------|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ExtensionGUID | String                                                | Read/Write. A unique GUID for this Extension.                                                                                                              |
| Join          | String                                                | Read/Write. The GUID of the step where this Extension rejoins the Scenario.                                                                                |
| JoiningStep   | <a href="#">ScenarioStep</a><br><small>[1894]</small> | Read only. The actual step where this Extension rejoins the Scenario, if any.                                                                              |
| Level         | String                                                | Read only. The number of this Extension as shown in the scenario editor. This is derived from the value of <i>Pos</i> for this object and the owning step. |
| Name          | String                                                | Read/Write. The Extension name.<br><br><ul style="list-style-type: none"> <li>This should match the name of the linked scenario</li> </ul>                 |
| ObjectType    | <a href="#">ObjectType</a><br><small>[1835]</small>   | Read only. Distinguishes objects referenced through a Dispatch interface.                                                                                  |
| Pos           | Long                                                  | Read/Write. The position of the Extension in the Extensions list                                                                                           |
| Scenario      | <a href="#">Scenario</a><br><small>[1892]</small>     | Read only. The scenario that is executed as an alternative path for this Extension.                                                                        |

### ScenarioExtension Methods

| Method                 | Type           | Notes                                                                                                                                                                                    |
|------------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs.    |
| <b>Update ()</b>       | <i>Boolean</i> | Update the current <i>ScenarioExtension</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information. |

### 18.2.2.5.12 ScenarioStep Class

#### ScenarioStep Attributes

| Attribute              | Type                                   | Notes                                                                                                                                                                                                                            | See Also                                                                                                                                                    |
|------------------------|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Extensions</b>      | <i>Collection of ScenarioExtension</i> | Read only. A collection of <i>ScenarioExtension</i> objects that specify how the scenario is extended from this step. The arguments to <b>AddNew</b> should match the name and GUID of the alternative scenario being linked to. | <a href="#">Collection</a> <sup>[1841]</sup><br><a href="#">ScenarioExtension</a> <sup>[1893]</sup>                                                         |
| <b>Level</b>           | <i>String</i>                          | Read only. The number of this Step as shown in the scenario editor. This is derived from the value of <i>Pos</i> .                                                                                                               |                                                                                                                                                             |
| <b>Link</b>            | <i>String</i>                          | Read/Write. The GUID of a Use Case that is relevant to this step.                                                                                                                                                                |                                                                                                                                                             |
| <b>LinkedElement</b>   | <i>Element</i>                         | Read only. The actual element specified by Link, if any.                                                                                                                                                                         | <a href="#">Element</a> <sup>[1877]</sup>                                                                                                                   |
| <b>Name</b>            | <i>String</i>                          | Read/Write. The Step name.                                                                                                                                                                                                       |                                                                                                                                                             |
| <b>ObjectType</b>      | <i>ObjectType</i>                      | Read only. Distinguishes objects referenced through a Dispatch interface.                                                                                                                                                        | <a href="#">ObjectType</a> <sup>[1835]</sup>                                                                                                                |
| <b>Pos</b>             | <i>Long</i>                            | Read/Write. The position of the Step in the Scenario Step list.                                                                                                                                                                  |                                                                                                                                                             |
| <b>Results</b>         | <i>String</i>                          | Read/Write. Any results that are given from this step.                                                                                                                                                                           |                                                                                                                                                             |
| <b>State</b>           | <i>String</i>                          | Read/Write. A description of the state the system enters when this Step is executed.                                                                                                                                             |                                                                                                                                                             |
| <b>StepGUID</b>        | <i>String</i>                          | Read/Write. A unique GUID for this Step.                                                                                                                                                                                         |                                                                                                                                                             |
| <b>StepType</b>        | <i>ScenarioStepType</i>                | Read/Write. Identifies whether this step is being performed by a user or the system.                                                                                                                                             | <a href="#">ScenarioStepType</a> <sup>[1838]</sup>                                                                                                          |
| <b>Uses</b>            | <i>String</i>                          | Read/Write. Input and requirements that are relevant to this step.                                                                                                                                                               |                                                                                                                                                             |
| <b>UsesElementList</b> | <i>Collection of Element</i>           | Read only. Indicates that the Structured Specification tab <b>Uses</b> field is a linked element list.                                                                                                                           | <a href="#">Collection</a> <sup>[1841]</sup><br><a href="#">Element</a> <sup>[1877]</sup><br><a href="#">Set Up Scenario Specification</a> <sup>[669]</sup> |

ScenarioStep Methods

| Method                 | Type           | Notes                                                                                                                                                                                 |
|------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| <b>Update ()</b>       | <i>Boolean</i> | Update the current <i>ScenarioStep</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.   |

**18.2.2.5.13 TaggedValue Class**

A *TaggedValue* is a named property and value associated with an element. It is accessed through the *TaggedValues* collection.

Associated table in .EAP file: *t\_objectproperties*

TaggedValue Attributes

| Attribute           | Type                                              | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ElementID</b>    | <i>Long</i>                                       | Read/Write. The local ID of the associated element.                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>FQName</b>       | <i>String</i>                                     | Read only. The fully-qualified name of the tag.                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Name</b>         | <i>String</i>                                     | Read/Write. Name of the tag.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Notes</b>        | <i>String</i>                                     | Read/Write. Further descriptive notes about this tag.<br><br>If <b>Value</b> (below) is set to " <b>&lt;memo&gt;</b> ", then <b>Notes</b> should contain the actual Tagged Value content.                                                                                                                                                                                                                                            |
| <b>ObjectType</b>   | <a href="#">ObjectType</a><br><small>1835</small> | Read only. Distinguishes objects referenced through a Dispatch interface.                                                                                                                                                                                                                                                                                                                                                            |
| <b>PropertyGUID</b> | <i>String</i>                                     | Read/Write. The tag global ID.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>PropertyID</b>   | <i>Long</i>                                       | Read only. The tag local ID.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Value</b>        | <i>String</i>                                     | Read/Write. The value assigned to this tag.<br><br>This field has a 255 character limit. If the value is greater than 255 characters long, set the value to " <b>&lt;memo&gt;</b> " and insert the body of text in the <b>Notes</b> attribute (above).<br><br>When reading existing Tagged Values, if <b>Value</b> = " <b>&lt;memo&gt;</b> " then the developer should read the actual body of text from the <b>Notes</b> attribute. |

TaggedValue Methods

| Method                | Type          | Notes                                                                    |
|-----------------------|---------------|--------------------------------------------------------------------------|
| <b>GetLastError()</b> | <i>String</i> | Returns a string value describing the most recent error that occurred in |

| Method          | Type           | Notes                                                                                                                                                                       |
|-----------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 |                | relation to this object.<br>This function is rarely used as an exception is thrown when an error occurs.                                                                    |
| <b>Update()</b> | <i>Boolean</i> | Update the current TaggedValue object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information. |

#### 18.2.2.5.14 Test Class

A *Test* is a single Test Case applied to an element. Tests are added and accessed through the Element *Tests* collection.

Associated table in .EAP file: *t\_objecttests*

#### Test Attributes

| Attribute                 | Type                                 | Notes                                                                                                                                |
|---------------------------|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>AcceptanceCriteria</b> | <i>String</i>                        | Read/Write. The acceptance criteria for successful execution.                                                                        |
| <b>CheckedBy</b>          | <i>String</i>                        | Read/Write. Results confirmed by.                                                                                                    |
| <b>Class</b>              | <i>Long</i>                          | Read/Write. The test Class:<br>1 = Unit Test<br>2 = Integration Test<br>3 = System Test<br>4 = Acceptance Test<br>5 = Scenario Test. |
| <b>DateRun</b>            | <i>Date</i>                          | Read/Write. Date last run.                                                                                                           |
| <b>Input</b>              | <i>String</i>                        | Read/Write. Input data.                                                                                                              |
| <b>Name</b>               | <i>String</i>                        | Read/Write. The test name.                                                                                                           |
| <b>Notes</b>              | <i>String</i>                        | Read/Write. Detailed notes about test to be carried out.                                                                             |
| <b>ObjectType</b>         | <a href="#">ObjectType</a><br>[1835] | Read only. Distinguishes objects referenced through a Dispatch interface.                                                            |
| <b>RunBy</b>              | <i>String</i>                        | Read/Write. Person conducting test.                                                                                                  |
| <b>Status</b>             | <i>String</i>                        | Read/Write. Current status of test.                                                                                                  |
| <b>TestResults</b>        | <i>Variant</i>                       | Read/Write. Results of test.                                                                                                         |
| <b>Type</b>               | <i>String</i>                        | Read/Write. The test type, such as Load or Regression.                                                                               |

#### Test Methods

| Method                 | Type          | Notes                                                                 |
|------------------------|---------------|-----------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i> | Returns a string value describing the most recent error that occurred |

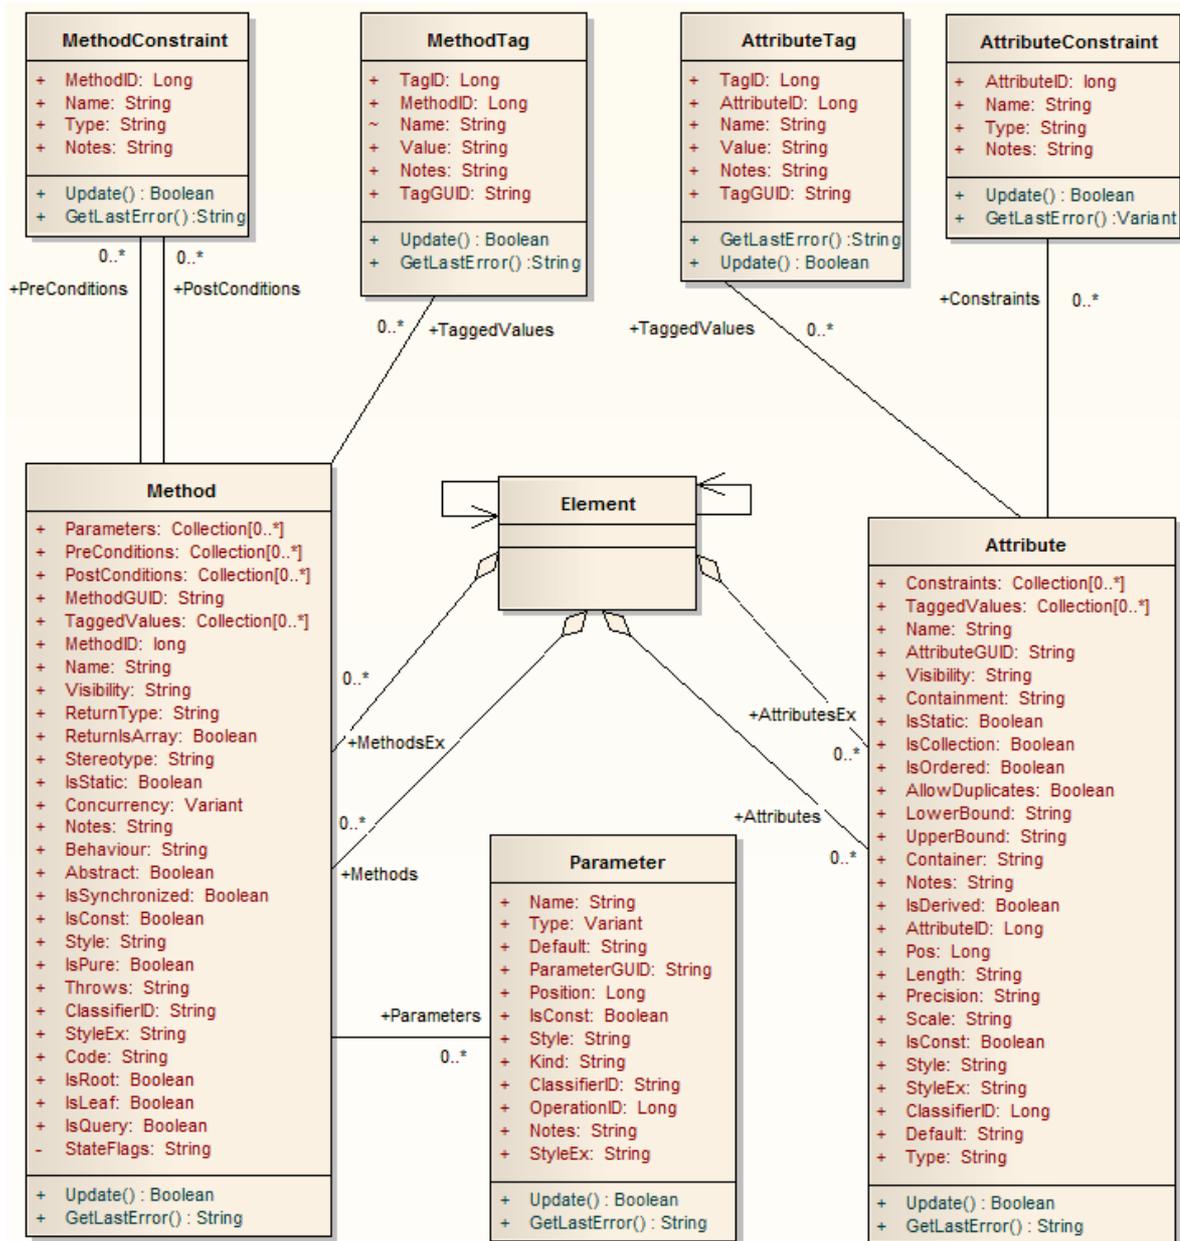

| Method           | Type           | Notes                                                                                                                                                                |
|------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  |                | in relation to this object.<br>This function is rarely used as an exception is thrown when an error occurs.                                                          |
| <b>Update ()</b> | <i>Boolean</i> | Update the current Test object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information. |

### 18.2.2.6 Element Features Package

The *ElementFeatures* package contains descriptions of the model interfaces that enable access to operations and attributes, and their associated Tagged Values and constraints.

This diagram illustrates the components associated with element features. These include *Attributes* and *Methods*, and the associated constraints and Tagged Values related to them. It also includes the *Parameter* object that defines the arguments associated with an operation (method).

#### Example:

**18.2.2.6.1 Attribute Class**

An *attribute* corresponds to a UML Attribute. It contains further collections for constraints and Tagged Values. Attributes are accessed from the Element *Attributes* collection.

Associated table in .EAP file: *t\_attribute*

**Attribute Attributes**

| Attribute              | Type           | Notes                                                                                                                                                                  |
|------------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AllowDuplicates</b> | <i>Boolean</i> | Read/Write. Indicates if duplicates are allowed in the collection. If the attribute represents a database column, this when set represents the <b>Not Null</b> option. |

| Attribute     | Type                                 | Notes                                                                                                                                                                        |
|---------------|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AttributeGUID | String                               | Read only. A globally unique ID for the current attribute. System generated.                                                                                                 |
| AttributeID   | Long                                 | Read only. Local ID number of the attribute.                                                                                                                                 |
| ClassifierID  | Long                                 | Read/Write. Classifier ID, if appropriate; indicates the base type associated with attribute, if not a primitive type.                                                       |
| Container     | String                               | Read/Write. The container type.                                                                                                                                              |
| Containment   | String                               | Read/Write. Type of containment. Can be <b>Not Specified, By Reference</b> or <b>By Value</b> .                                                                              |
| Constraints   | <a href="#">Collection</a><br>[1847] | Read only. A collection of <i>AttributeConstraint</i> objects. Used to access and manage constraints associated with this attribute.                                         |
| Default       | String                               | Read/Write. Initial value assigned to this attribute.                                                                                                                        |
| IsCollection  | Boolean                              | Read/Write. Indicates if the current feature is a collection or not. If the attribute represents a database column, this when set represents a Foreign Key.                  |
| IsConst       | Boolean                              | Read/Write. Flag indicating if the attribute is <b>Const</b> or not.                                                                                                         |
| IsDerived     | Boolean                              | Read/Write. Indicates if the attribute is derived (that is, a calculated value).                                                                                             |
| IsOrdered     | Boolean                              | Read/Write. Indicates if a collection is ordered or not. If the attribute represents a database column, this when set represents a Primary Key.                              |
| IsStatic      | Boolean                              | Read/Write. Indicates if the current attribute is a static feature or not. If the attribute represents a database column, this when set represents the <b>Unique</b> option. |
| Length        | String                               | Read/Write. The attribute length, where applicable.                                                                                                                          |
| LowerBound    | String                               | Read/Write. A value for the collection lower bound.                                                                                                                          |
| Name          | String                               | Read/Write. The attribute name.                                                                                                                                              |
| Notes         | String                               | Read/Write. Further notes about this attribute.                                                                                                                              |
| ObjectType    | <a href="#">ObjectType</a><br>[1835] | Read only. Distinguishes objects referenced through a Dispatch interface.                                                                                                    |
| ParentID      | Long                                 | Read only. Returns the <i>ElementID</i> of the element that this attribute is a part of.                                                                                     |
| Pos           | Long                                 | Read/Write. Position of the attribute in the Class attribute list.                                                                                                           |
| Precision     | String                               | Read/Write. Precision value.                                                                                                                                                 |
| Scale         | String                               | Read/Write. Scale value.                                                                                                                                                     |
| Stereotype    | String                               | Read/Write. Sets or gets the stereotype for this attribute.                                                                                                                  |
| StereotypeEx  | String                               | Read/Write. All the applied stereotypes of the attribute in a comma-separated list.                                                                                          |
| Style         | String                               | Read/Write. Contains the <b>Alias</b> property for this attribute.                                                                                                           |
| StyleEx       | String                               | Read/Write. Advanced style settings. Reserved for the use of Sparx Systems.                                                                                                  |

| Attribute             | Type                                                                                   | Notes                                                                                                                              |
|-----------------------|----------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>TaggedValues</b>   | <a href="#">Collection</a><br>[1847] of type<br><a href="#">AttributeTag</a><br>[1907] | Read only. A collection of AttributeTag objects. Use to access and manage Tagged Values associated with this attribute.            |
| <b>TaggedValuesEx</b> | <a href="#">Collection</a><br>[1847] of type<br><a href="#">TaggedValue</a><br>[1895]  | Read only. Collection of TaggedValue objects belonging to the current attribute and the TaggedValuesEx property of its classifier. |
| <b>Type</b>           | String                                                                                 | Read/Write. The attribute type (by name; also see <i>ClassifierID</i> ).                                                           |
| <b>UpperBound</b>     | String                                                                                 | Read/Write. A value for the collection upper bound.                                                                                |
| <b>Visibility</b>     | String                                                                                 | Read/Write. The scope of the attribute. Can be <b>Private</b> , <b>Protected</b> , <b>Public</b> or <b>Package</b> .               |

#### Attribute Methods

| Method                 | Type    | Notes                                                                                                                                                                                 |
|------------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | String  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| <b>Update ()</b>       | Boolean | Updates the current attribute object after modifying or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.               |

#### Notes:

- The Attribute Class in Enterprise Architect does not have an **Alias** property. You can access the **Alias** property of the Attribute Class using the **Style** property.

#### 18.2.2.6.2 **AttributeConstraint Class**

An *AttributeConstraint* is a constraint associated with the current Attribute.

Associated table in .EAP file: *t\_attributeconstraints*

#### AttributeConstraint Attributes

| Attribute          | Type                              | Notes                                                                     |
|--------------------|-----------------------------------|---------------------------------------------------------------------------|
| <b>AttributeID</b> | Long                              | Read/Write. ID of the attribute this constraint applies to.               |
| <b>Name</b>        | String                            | Read/Write. The constraint.                                               |
| <b>Notes</b>       | String                            | Read/Write. Descriptive notes about constraint.                           |
| <b>ObjectType</b>  | <a href="#">ObjectType</a> [1835] | Read only. Distinguishes objects referenced through a Dispatch interface. |

| Attribute | Type   | Notes                           |
|-----------|--------|---------------------------------|
| Type      | String | Read/Write. Type of constraint. |

#### AttributeConstraint Methods

| Method          | Type    | Notes                                                                                                                                                                                      |
|-----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GetLastError () | String  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs.      |
| Update ()       | Boolean | Update the current <i>AttributeConstraint</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information. |

#### 18.2.2.6.3 AttributeTag Class

An *AttributeTag* represents a Tagged Value associated with an attribute.

Associated table in .EAP file: *t\_attributetag*

#### AttributeTag Attributes

| Attribute   | Type                                 | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AttributeID | Long                                 | Read/Write. Local ID of attribute associated with this Tagged Value.                                                                                                                                                                                                                                                                                                                                                                 |
| FQName      | String                               | Read only. The fully-qualified name of the tag.                                                                                                                                                                                                                                                                                                                                                                                      |
| Name        | String                               | Read/Write. Name of tag.                                                                                                                                                                                                                                                                                                                                                                                                             |
| Notes       | String                               | Read/Write. Further descriptive notes about this tag.<br><br>If <b>Value</b> (below) is set to " <b>&lt;memo&gt;</b> ", then <b>Notes</b> should contain the actual Tagged Value content.                                                                                                                                                                                                                                            |
| ObjectType  | <a href="#">ObjectType</a><br>[1835] | Read only. Distinguishes objects referenced through a Dispatch interface.                                                                                                                                                                                                                                                                                                                                                            |
| TagGUID     | String                               | Read/Write. A globally unique ID for this Tagged Value.                                                                                                                                                                                                                                                                                                                                                                              |
| TagID       | Long                                 | Read only. Local ID to identify Tagged Value.                                                                                                                                                                                                                                                                                                                                                                                        |
| Value       | String                               | Read/Write. The value assigned to this tag.<br><br>This field has a 255 character limit. If the value is greater than 255 characters long, set the value to " <b>&lt;memo&gt;</b> " and insert the body of text in the <b>Notes</b> attribute (above).<br><br>When reading existing Tagged Values, if <b>Value</b> = " <b>&lt;memo&gt;</b> " then the developer should read the actual body of text from the <b>Notes</b> attribute. |

#### AttributeTag Methods

| Method                 | Type           | Notes                                                                                                                                                                                 |
|------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| <b>Update ()</b>       | <i>Boolean</i> | Updates the current <i>AttributeTag</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.  |

#### 18.2.2.6.4 CustomProperties Collection

The *CustomProperties* collection contains 0 or more *Cust Properties* associated with the current element. These properties provide advanced UML configuration options, and must not be added to or deleted. The value of each property can be set.

##### CustomProperty

| Attribute         | Type                                                | Notes                                                                                                                                                                                                                                                                    |
|-------------------|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Name</b>       | <i>String</i>                                       | Read only. The CustomProperty name.                                                                                                                                                                                                                                      |
| <b>ObjectType</b> | <a href="#">ObjectType</a><br><small>[1835]</small> | Read only. Distinguishes objects referenced through a Dispatch interface.                                                                                                                                                                                                |
| <b>Value</b>      | <i>String</i>                                       | Read/Write. The value associated with this custom property. Can be a string, the boolean values <b>true</b> or <b>false</b> , or an enumeration value from a defined list. The UML 2.3 specification in general provides information on enumeration kinds relevant here. |

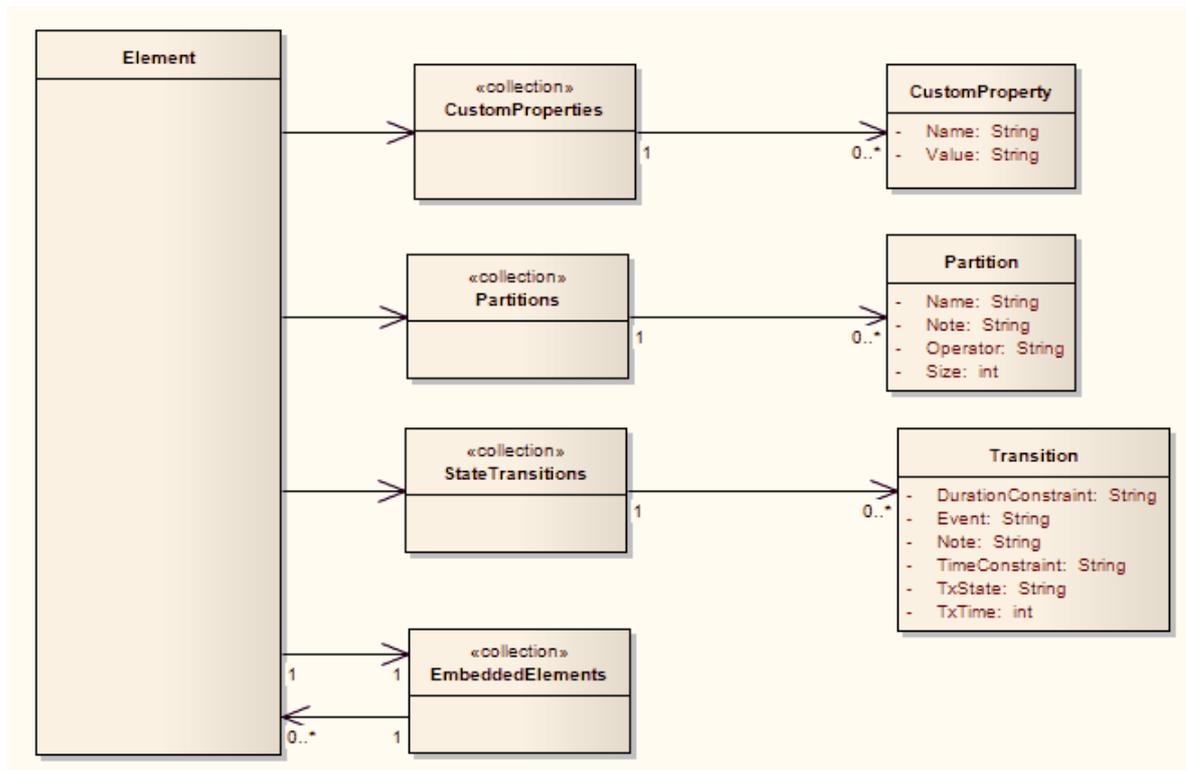

- The number and type of properties vary depending on the actual element

#### 18.2.2.6.5 EmbeddedElements Collection

In UML 2.3 an element can have one or more embedded elements such as Ports, Pins, Parameters or ObjectNodes. These are attached to the boundary of the host element and cannot be moved off the element. They are owned by their host element. This collection gives easy access to the set of elements embedded on the surface of an element. Note that some embedded elements can have their own embedded element collection (for example, Ports can have Interfaces embedded on them).

The *EmbeddedElements* collection contains Element objects.

##### Example:

#### 18.2.2.6.6 Method Class

A *method* represents a UML *operation*. It is accessed from the Element *Methods* collection and includes collections for parameters, constraints and Tagged Values.

Associated table in .EAP file: *t\_operation*

#### Method Attributes

| Attribute           | Type           | Notes                                                                                                                                                                                                                                                                                                         |
|---------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Abstract</b>     | <i>Boolean</i> | Read/Write. Flag indicating if the method is abstract ( <b>1</b> ) or not ( <b>0</b> ).                                                                                                                                                                                                                       |
| <b>Behavior</b>     | <i>String</i>  | Read/Write. Some further explanatory behavior notes (for example, pseudocode).<br><br>In earlier releases of Enterprise Architect this attribute had the UK/ Australian spelling 'Behaviour'; this is still present for backwards compatibility, but please now use the 'Behavior' attribute for consistency. |
| <b>ClassifierID</b> | <i>String</i>  | Read/Write. Classifier ID that applies to the <i>ReturnType</i> .                                                                                                                                                                                                                                             |
| <b>Code</b>         | <i>String</i>  | Read/Write. Optional field to hold the method Code (used for the <b>Initial Code</b> field).                                                                                                                                                                                                                  |
| <b>Concurrency</b>  | <i>Variant</i> | Read/Write. Concurrency type of method.                                                                                                                                                                                                                                                                       |
| <b>IsConst</b>      | <i>Boolean</i> | Read/Write. Flag indicating the method is <b>Const</b> .                                                                                                                                                                                                                                                      |
| <b>IsLeaf</b>       | <i>Boolean</i> | Read/Write. Flag to indicate if the method is <i>Leaf</i> (cannot be overridden).                                                                                                                                                                                                                             |
| <b>IsPure</b>       | <i>Boolean</i> | Read/Write. Flag indicating the method is defined as Pure in C++.                                                                                                                                                                                                                                             |

| Attribute      | Type                                                                                                                 | Notes                                                                                                                                |
|----------------|----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| IsQuery        | Boolean                                                                                                              | Read/Write. Flag to indicate if the method is a query (that is, does not alter Class variables).                                     |
| IsRoot         | Boolean                                                                                                              | Read/Write. Flag to indicate if the method is <i>Root</i> .                                                                          |
| IsStatic       | Boolean                                                                                                              | Read/Write. Flag to indicate a static method.                                                                                        |
| IsSynchronized | Boolean                                                                                                              | Read/Write. Flag indicating a Synchronized method call.                                                                              |
| MethodGUID     | String                                                                                                               | Read/Write. A globally unique ID for the current method. System generated.                                                           |
| MethodID       | Long                                                                                                                 | Read only. A local ID for the current method, only valid within this .EAP file.                                                      |
| Name           | String                                                                                                               | Read/Write. The method name.                                                                                                         |
| Notes          | String                                                                                                               | Read/Write. Descriptive notes about the method.                                                                                      |
| ObjectType     | <a href="#">ObjectType</a><br><small>[1835]</small>                                                                  | Read only. Distinguishes objects referenced through a Dispatch interface.                                                            |
| Parameters     | <a href="#">Collection</a><br><small>[1841]</small>                                                                  | Read only. The <i>Parameters</i> collection for the current method. Use to add and access parameter objects for the current method.  |
| ParentID       | Long                                                                                                                 | Read only. Returns the <i>ElementID</i> of the element that this method belongs to.                                                  |
| Pos            | Long                                                                                                                 | Read/Write. Specifies the position of the method within the set of operations defined for a Class.                                   |
| PostConditions | <a href="#">Collection</a><br><small>[1841]</small>                                                                  | Read only. PostConditions (constraints) as they apply to this method. Returns a <i>MethodConstraint</i> object of type <b>post</b> . |
| PreConditions  | <a href="#">Collection</a><br><small>[1841]</small>                                                                  | Read only. PreConditions (constraints) as they apply to this method. Returns a <i>MethodConstraint</i> object of type <b>pre</b> .   |
| ReturnsArray   | Boolean                                                                                                              | Read/Write. Flag to indicate the return value is an array.                                                                           |
| ReturnType     | String                                                                                                               | Read/Write. Return type for the method; can be a primitive data type or a Class or Interface type.                                   |
| StateFlags     | String                                                                                                               | Read/Write. Some flags as applied to methods in State elements.                                                                      |
| Stereotype     | String                                                                                                               | Read/Write. The method stereotype (optional).                                                                                        |
| StereotypeEx   | String                                                                                                               | Read/Write. All the applied stereotypes of the method in a comma-separated list.                                                     |
| Style          | String                                                                                                               | Read/Write. Contains the <b>Alias</b> property for this method.                                                                      |
| StyleEx        | String                                                                                                               | Read/Write. Advanced style settings. Reserved for the use of Sparx Systems.                                                          |
| TaggedValues   | <a href="#">Collection</a><br><small>[1841]</small><br>of type<br><a href="#">MethodTag</a><br><small>[1906]</small> | Read only. <i>TaggedValues</i> collection for the current method. Accesses a list of <i>MethodTag</i> objects.                       |
| Throws         | String                                                                                                               | Read/Write. Exception information.                                                                                                   |
| Visibility     | String                                                                                                               | Read/Write. The method scope: <b>Public</b> , <b>Protected</b> , <b>Private</b> or <b>Package</b> .                                  |

Method Methods

| Method                 | Type           | Notes                                                                                                                                                                                 |
|------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs. |
| <b>Update ()</b>       | <i>Boolean</i> | Update the current method object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.                |

**18.2.2.6.7 MethodConstraint Class**

A *MethodConstraint* is a condition imposed on a method. It is accessed through either the Method *PreConditions* or Method *PostConditions* collection.

Associated table in .EAP file: *t\_operationpres* and *t\_operationposts*

MethodConstraint Attributes

| Attribute         | Type                                 | Notes                                                                     |
|-------------------|--------------------------------------|---------------------------------------------------------------------------|
| <b>MethodID</b>   | <i>Long</i>                          | Read/Write. The local ID of the associated method.                        |
| <b>Name</b>       | <i>String</i>                        | Read/Write. The name of the constraint.                                   |
| <b>Notes</b>      | <i>String</i>                        | Read/Write. Descriptive notes about this constraint.                      |
| <b>ObjectType</b> | <a href="#">ObjectType</a><br>[1835] | Read only. Distinguishes objects referenced through a Dispatch interface. |
| <b>Type</b>       | <i>String</i>                        | Read/Write. The constraint type.                                          |

MethodConstraint Methods

| Method                 | Type           | Notes                                                                                                                                                                                   |
|------------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object.<br><br>This function is rarely used as an exception is thrown when an error occurs.   |
| <b>Update ()</b>       | <i>Boolean</i> | Update the current <i>MethodConstraint</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information. |

### 18.2.2.6.8 MethodTag Class

A *MethodTag* is a Tagged Value associated with a method.

Associated table in .EAP file: *t\_operationtag*

#### MethodTag Attributes

| Attribute         | Type                                                | Notes                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>FQName</b>     | <i>String</i>                                       | Read only. The fully-qualified name of the tag.                                                                                                                                                                                                                                                                                                                                                                              |
| <b>MethodID</b>   | <i>Long</i>                                         | Read/Write. The ID of the associated method.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Name</b>       | <i>String</i>                                       | Read/Write. The tag or name of the property.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Notes</b>      | <i>String</i>                                       | Read/Write. Further descriptive notes about this tag.<br>If <b>Value</b> (below) is set to " <b>&lt;memo&gt;</b> ", then <b>Notes</b> should contain the actual Tagged Value content.                                                                                                                                                                                                                                        |
| <b>ObjectType</b> | <a href="#">ObjectType</a><br><small>[1835]</small> | Read only. Distinguishes objects referenced through a Dispatch interface.                                                                                                                                                                                                                                                                                                                                                    |
| <b>TagGUID</b>    | <i>String</i>                                       | Read/Write. A unique GUID for this Tagged Value.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>TagID</b>      | <i>Long</i>                                         | Read only. A unique ID for this Tagged Value.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Value</b>      | <i>String</i>                                       | Read/Write. The value assigned to this tag.<br>This field has a 255 character limit. If the value is greater than 255 characters long, set the value to " <b>&lt;memo&gt;</b> " and insert the body of text in the <b>Notes</b> attribute (above).<br>When reading existing Tagged Values, if <b>Value</b> = " <b>&lt;memo&gt;</b> " then the developer should read the actual body of text from the <b>Notes</b> attribute. |

#### MethodTag Methods

| Method                 | Type           | Notes                                                                                                                                                                             |
|------------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GetLastError ()</b> | <i>String</i>  | Returns a string value describing the most recent error that occurred in relation to this object.<br>This function is rarely used as an exception is thrown when an error occurs. |
| <b>Update ()</b>       | <i>Boolean</i> | Updates the current <i>MethodTag</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information. |

### 18.2.2.6.9 Parameter Class

A *Parameter* object represents a method argument and is accessed through the *Method Parameters* collection.

Associated table in .EAP file: *t\_operationparams*

**Parameter Attributes**

| Attribute     | Type                                                                               | Notes                                                                                    |
|---------------|------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| Alias         | String                                                                             | Read/Write. An optional alias for this parameter.                                        |
| ClassifierID  | String                                                                             | Read/Write. A ClassifierID for the parameter, if known.                                  |
| Default       | String                                                                             | Read/Write. A default value for this parameter.                                          |
| IsConst       | Boolean                                                                            | Read/Write. Flag indicating the parameter is <i>Const</i> (cannot be altered).           |
| Kind          | String                                                                             | Read/Write. The parameter kind - <b>in</b> , <b>inout</b> , <b>out</b> , <b>return</b> . |
| Name          | String                                                                             | Read/Write. The parameter name; must be unique for a single method.                      |
| Notes         | String                                                                             | Read/Write. Descriptive notes.                                                           |
| ObjectType    | <a href="#">ObjectType</a><br>[1835]                                               | Read only. Distinguishes objects referenced through a Dispatch interface.                |
| OperationID   | Long                                                                               | Read only. ID of the method associated with this parameter.                              |
| ParameterGUID | String                                                                             | Read/Write. A globally unique ID for the current Parameter. System generated.            |
| Position      | Long                                                                               | Read/Write. The position in the argument list.                                           |
| Stereotype    | String                                                                             | Read/Write. The first stereotype of the parameter.                                       |
| StereotypeEx  | String                                                                             | Read/Write. All the applied stereotypes of the parameter in a comma-separated list.      |
| Style         | String                                                                             | Read/Write. Some style information.                                                      |
| StyleEx       | String                                                                             | Read/Write. Advanced style settings. Reserved for the use of Sparx Systems.              |
| TaggedValues  | <a href="#">Collection</a><br>[1847] of type<br><a href="#">ParamTag</a><br>[1908] | Read/Write. GUID of the parameter with which this <i>ParamTag</i> is associated.         |
| Type          | Variant                                                                            | Read/Write. The parameter type; can be a primitive type or defined classifier.           |

**Parameter Methods**

| Method          | Type    | Notes                                                                                                                                                                                 |
|-----------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
